TO THE DEAR MEMORY OF

Sir Francis Palgrave, K.H., and Elizabeth, Lady Palgrave

HIS PARENTS, TEACHERS, FRIENDS

THIS WORK IS DEDICATED BY

R. H. INGLIS PALGRAVE

## PREFACE

THE aim of this work is the assistance of the English-speaking student of Economic Science to the better understanding of the questions in which he is interested. These questions, while dealing with matters of ordinary life, are often more abstruse and intricate than appears to a superficial observer, and they require careful thought and study to unravel.

The performance of this task, difficult and laborious enough in itself, has not been rendered more easy by the fact that the work has to cover an absolutely new field in English literature. There exists at the present time no completed work in our language which exactly fills the same place, or which could in any way serve as a guide. The laborious commencement made by MacLeod extends only as far as the letter C. The *Standard Library Cyclopædia of Political, Constitutional, Statistical, and Forensic Knowledge*, 1860, does not cover the same ground; nor does the *American Cyclopædia of Political Science, Political Economy, and United States History*, 1888, undertake what has been attempted here. In the French and German languages there are very valuable works on the subject, among which may be cited the *Dictionnaire de l'Économie Politique*, edited by Coquelin and Guillaumin, 1853; the *Nouveau Dictionnaire d'Économie Politique*, edited by Léon Say and Joseph Chailley, 1891; the *Dictionnaire des Finances*, edited under the direction of Léon Say by Louis Foyot and A. Lanjolley, 1889; and the *Handwörterbuch der Staatswissenschaften*, edited by Conrad, Elster, Lexis, and Loening, the first part of the first edition of which was published in 1890, the second edition having been commenced in 1898. These works have been studied and their arrangement considered. But the dictionaries which cover the corresponding ground in other languages, though written by very competent and erudite men, could not serve exactly as models for a book intended for the English student, whose requirements had particularly to be provided for. Yet, although specially written for the English-speaking races, it is believed that this book may claim that international or cosmopolitan character which should mark any work on economic science; for, among the contributors, besides the many very able English, are numbered some of the most distinguished American and foreign Economists.

I now thankfully bring my work to a conclusion, greatly indebted to the consideration of my publishers, Messrs. Macmillan and Co., who have kindly waited till a book, promised, with a sincere expectation of fulfilment, in three years, has

been completed in the twelfth year, and who have also, greatly to the advantage of the reader, allowed an extension of space from two volumes to three, thus permitting a greater fulness of treatment than could otherwise have been possible. The time spent in the actual construction of the work represents, however, but a comparatively small part of that period during which it has been the subject of my thoughts, a period which covers a very large part of my life. And yet after these years of labour I am most deeply conscious not only of omissions but also of imperfections inevitable in a work of this description.

I may now turn, and with more pleasure, to an explanation of the plan which has been followed. It was obvious that the limits of space did not permit an absolutely exhaustive treatment of most, if of any of the subjects contained in the Dictionary. Each heading, however, has been dealt with as fully as possible. Every effort has been made to give the most complete information attainable by means of cross-references to the other articles contained in the work which take up different portions of the subject and will thus assist the reader. Clearness has not been sacrificed to the exigencies of space. Where, indeed, clearness could not be attained without employing some considerable space or even some repetition, this has been allowed, and, equally wherever possible, care has been taken to supply an adequate bibliography of each subject.

It is thus hoped that the Dictionary will assist the student to carry out any special investigation, by giving him some preliminary information, and by referring him to the best authorities. In selecting these authorities, while due attention has been given to the more important writers, reference has also been made to many whose works, valuable in themselves, are less generally studied, and who may perhaps have only contributed a monograph on the particular subject under notice. The works of men comparatively unknown, remote from us through the countries where they lived or the period when they wrote, are often of considerable service in elucidating particular cases or illustrating special points in history. The same principle has been applied to the biographies. Considerable attention has been given to the less known writers, for the same reason. It is easy for the student to find out all that he requires about the works of the more celebrated men, while he frequently finds it difficult to obtain information about the more obscure, a knowledge of whose investigations, however, may be necessary to him. Better that fifty should consider an explanation superfluous than that one should find a difficulty unsolved.

It may be claimed for the Dictionary that it contains many examples of original research into the literary history of unknown English worthies whose writings have not hitherto been adequately discussed. The biographical articles have been confined to notices of writers no longer living with the single exception of Prof. Léon Walras, who so closely carried on the work of his father Prof. Antoine Walras that it was not possible to mention the latter without also describing the works of his son. The works of authors now living are quoted in connection with the subjects which they elucidate.

The turn which the study of economics has taken in recent years has necessitated corresponding developments in this work. The historical side of the study

has been constantly remembered as well as the more recent effort to gain greater exactness through the employment of mathematical methods.

In connection with the first branch of the subject, articles will be found both on the Historical Method and on the Historical School of Economists. The early history of economic movements has been explained with reference both to theory and to practice, as in the articles on the Canon Law and Gilds, and the Mercantile System—all of which may be claimed as still having survivals in modern thought. Some space also has been devoted to short histories, as of the trading companies formerly so powerful in this country, and of the Hanseatic League, whose influence on the continent of Europe extended so widely.

In connection with the employment of mathematical methods the use of Diagrams is also explained, as well as the Graphic Method. These articles show the use which may be made of Diagrams both in abstract theoretic exposition and in the explanation of concrete economic phenomena. A practical application of these methods for the use either of students or business men will be found in the article on Polegraphy, the name given to a graphic method recently devised to enable those concerned to obtain a clear view for practical purposes of complex combinations of operations either on the stock or produce exchanges. This article contains, it is believed, the first explanation of this method available for the English reader.

Whatever method we use we must ever bear in mind the necessity of constant, careful, and exact observation of facts. We must "classify our facts before we generalise, and seek for narrower generalisations and inductions before we aim at the highest."

As the limits of space compelled concentration, and this work is intended mainly for the service of students among the English-speaking peoples, the developments of economic thought in other countries, however interesting, have necessarily not received the same fulness of treatment as those which have taken place within our own shores. Yet these subjects have not been neglected.

The Dictionary contains, it is believed, the first attempt which has ever been made in a work of this description to give, under separate heads, an account of the labours of the principal writers and the characteristics of the different schools of economic thought throughout the civilised world.

The work of the economic Schools of England, in which last we may include the growing and powerful body of thinkers in America; the labours of the Schools of Austria, of France, Germany, Holland, Italy, Russia, and Spain, have thus formed the subjects of separate articles. These may be commended to the special attention of the reader. They will help him to understand the various modifications of doctrine and opinion which the study has undergone. And if, in all cases, opinions are not agreed, much may be ascribed to the different requirements of national life in different countries.

The student who examines these articles will find that he is able to carry his investigations further by means of the separate notices of the principal writers named, and of the special subjects to which reference is made.

Thus the reader of the article on the French School will have his attention called to the writings of the many able Frenchmen who have written on Economics,

to the work, for example, of the Physiocrats, and their organs, the *Ephémérides* and the *Nouvelles Ephémérides*—the only known complete set of which was liberally placed at the disposal of Dr. Bauer, who wrote the article on that subject. The many important writers referred to in the article on the German School show, especially in recent years, the influence of the great German thinkers, Kant, Fichte, and Hegel, who, though they can scarcely be claimed as economists, yet influenced and modified economic thought far beyond the boundaries of their own country. The student of Economics will do well to examine these articles carefully, as well as those on the Italian, Russian, and Spanish Schools.

These articles contain much information on points in the economic development of the countries concerned, which may be new to the readers of the Dictionary. In our own country, to give merely two examples, the spirit of enterprise which has marked British character and peopled British colonies has been largely influenced by the English Law of Wills, which has fostered the energetic side of life through the necessity for hard work. A reference to the articles on this subject will show how completely the English law differs in principle from the law of other European countries, and how far more free in this respect the power of bequest in this country is. Again as to agricultural matters it is well to be reminded that in our older English land-holding system the leases for a long term, formerly possessed by English yeomen, helped to develop a class whose existence strengthened an interest of the highest economic importance to the country.

The plan of the work has been set out all through as broadly as possible. Due consideration has been given to theory and method. That so often misinterpreted expression, the Laws of Political Economy, is explained—that these are not rules to be obeyed but scientific uniformities. There are also articles on the Method of Political Economy and on Political Economy itself, with explanatory articles on the main headings into which Economic Method is divided.

The practical side of Economics also has not been neglected. Articles are given on Business subjects, on Banks, Clearing Houses, Commercial Crises, Docks, Railways, Insurance, Bills of Exchange, and the Precious Metals, with a summary of recent events in Silver Legislation in the United States.

The use of statistics is also explained, with articles on the kindred subjects of Index Numbers and the Tabular Standard.

Financial subjects are dealt with, including Taxation, which, according to the manner in which it is levied, exercises so vast an influence on the welfare of a country. Articles will be found on the National Debt, on the Budget, on Finance generally, on Export and Import Duties, on the Income Tax both in England and abroad, on Graduated Taxation, on Death Duties, on Taxation as a whole, on the Internal Customs formerly in use in France, and on Octroi Duties.

But levying taxation, though one of the most important, is not by any means the only manner in which the powers exercised by legislation influence the welfare of a country. Government regulation of Industry, the Factory Acts, the laws affecting Labour generally, may be mentioned as subjects dealt with in this connection.

Perhaps in the legislation on the poor law the influence of economic thought is more perceptible than in any other branch of our administration. A reference to the economic writers of all ages and of all countries who have dealt with questions of charitable relief, and whose biographies will be found in these volumes, will show how universal the difficulty of assisting the poor without pauperising them has always been. The charitably-disposed have often had to deplore the injury which well-meant efforts have inflicted on those for whom help was intended.

The study of these volumes themselves will supply many and complete examples of what has briefly been recapitulated here. I venture to bring to an end this explanation of the object and scope of my work with a passage from one of my father's oldest friends, Mr. Henry Hallam, which I well remember reading with much interest in years past, little as I imagined then how closely it would describe my own feelings at this time.

"An author who waits till all requisite materials are accumulated to his hands, is but watching the stream that will run on for ever; and though I am fully sensible that I could have much improved what is now offered to the public by keeping it back for a longer time, I should but then have had to lament the impossibility of exhausting my subject. ΕΙΤΟΙΕΙ, the modest phrase of the Grecian sculptors, well expresses the imperfection that attaches to every work of literary industry or of philosophical investigation. But I have other warnings to bind up my sheaves while I may,—my own advancing years, and the gathering in the heavens."

In conclusion I have to express my sincere thanks to those who have assisted me by contributing to these volumes, and who have taken pains and trouble of which only the Editor can be aware. Specially my thanks are due to Dr. James Bonar, Prof. A. Caldecott, Prof. F. Y. Edgeworth, Mr. Henry Higgs, Dr. Ernest Schuster, and Mr. H. R. Tedder, who have helped in many ways as well as in preparing the work for the press, and to Miss Ethel Faraday for the labour and great attention she has bestowed on the Index.

My earnest hope as Editor is that this work may promote and facilitate the study of sound economic doctrine, the knowledge of which is essential to the lasting prosperity of our country.

R. H. INGLIS PALGRAVE.

BELTON, NEAR GREAT YARMOUTH.  
*Midsummer, 1899.*

La Filosofia è scritta in questo grandissimo libro, che continuamente ci sta aperto innanzi agli occhi (io dico l'Universo), ma non si può intendere, se prima non s'impara a intender la lingua, e conoscer i caratteri, nè quali è scritto.—GALILEO, *Il Saggiatore*. Opere, vol. vi. (ed. 1811), p. 229.

As in going of a way we do not only gain that part of the way which is passed, but we gain the better sight of that part of the way which remaineth; so every degree of proceeding in a science giveth a light to that which followeth.—BACON, *On the Advancement of Learning*, vol. iii. p. 392 (Ellis and Spedding ed., 1857).

In short we are very greatly in want of a Johnson's Dictionary of Political Economy, and possibly it may be in reserve for some young man, now of twenty years of age, to supply the deficiency by the time he shall be five and thirty.—*Lectures on the Nature and Use of Money*, by JOHN GRAY (Edinburgh), 1848, p. 96.

## TABLE OF CONTENTS OF VOL. III.

*The numbers immediately following the headings of the Articles are those of the pages on which the Articles will be found. BIOGRAPHIES in small capitals.*

Napoleon (Coin), 1	New Impost, 17	Oetroi, 31
NASSE, E., 1	New Subsidy, 17	ODDY, J. J., 33
Nation, 1	NEWBURY, Jack of, 17	Odel Tenure ( <i>see</i> Udal Tenure), 33
National Banks, U.S.A. ( <i>see</i> Banks), 2	NEWENHAM, T., 17	Official Receiver, 33
National Debt—	NEWMARCH, W., 17	Official Values, 33
1. Introduction, 2	NEWTON, Sir I., 18	OGILVIE, W., 33
2. National Debt of United Kingdom, 3	NICKERON, J. P., 20	OLIPHANT, C., 35
3. The Funding System, 4	NICHOLLS, Chevalier J., 20	OLIVARES, D. de, 35
National Debt, Redemption of ( <i>see</i> Redemption of National Debt), 4	NICHOLLS, Sir G., 20	OLUFSEN, O. C., 35
National Economy, 4	NICOLAI, 21	One Pound Note, 35

# DICTIONARY OF POLITICAL ECONOMY

## NAPOLEON—NATION

**NAPOLEON (COIN).** The twenty-franc piece of France, issued during the reign of Napoleon I., bears that ruler's name. It is a gold coin of the millesimal fineness of 900, weighing 99.56 grains; its value in sterling is 15s. 10½d. (see *FRANC*). F. E. A.

**NASSE, ERWIN (1829-1890)**, a distinguished economist, was born at Bonn, and studied there and at Göttingen. He was appointed professor at Basel in 1856, and within the same year at Rostock; in 1860 he became professor at Bonn. He took an active part in political affairs, and sat as a member of the Prussian house of representatives from 1869 to 1879. His most important publications were: *Bemerkungen über das preussische Steuersystem*, 1861;—*Die preussische Bank*, 1866;—*Ueber die mittelalterliche Feldgemeinschaft und die Einhegungen des 16. Jahrhunderts in England*, 1869 (translated into English by Col. H. A. Ouvry, and published by the Cobden Club in 1871, 2nd ed., 1872); *Geld und Münzwesen* in Schönberg's *Handbuch* (2nd ed., 1886); and *Das Sinken der Warenpreise während der letzten fünfzehn Jahre*, 1888. From 1874 till his death Professor Nasse was president of the *Verein für Sozialpolitik*, of which he had been one of the founders. He was associated with Ad. Wagner in the new edition of Rau's *Lehrbuch*, but his collaboration seems to have been, for the most part, merely nominal. He supplied to the *Verein für Sozialpolitik*, in vol. iii., "Die Personalbesteuerung," and in vol. xxvii., "Agrarische Zustände in Frankreich und England." He wrote largely on currency, banking, state-credit, prices, and taxation, contributing many articles on these subjects to economic and other journals. His memoir on the well-known work of "W. Stafford" is of special interest (*Zeitschr. d. Staatsw.*, vol. xix.) (see *W. S.*). His writings are marked by cautious exactness and moderation. In his general views he was one of those somewhat loosely described as **SOCIALISTS OF THE CHAIR** (*q.v.*). He warmly enulogises the *Verein für Sozialpolitik*, which was created by that group of economists, as having been the product of the

moral conscience of almost all Germany, and as having profoundly modified in a right direction the tendencies of public opinion. He insists on the insufficiency of a free field to individual interests, and the necessity of the application of moral ideas to the national economy through the action of the state (Lippert in *Handwörterbuch der Staatswissenschaften*). J. K. I.

In addition to his eminence as a general economist, Nasse is of particular importance in the history of economic thought for three reasons. His special studies in money, credit, and banking institutions, etc., have won for him a very high place as a monetary critic. In two other respects he must be regarded as a forerunner of movements which have now become very important. He was one of the early and professorial socialists, and did much to modify the mechanical and harsh direction which economic theory had assumed. In addition his studies in the **THREE FIELD SYSTEM** in England, though its conditions have been subject to much correction, drew attention to a valuable side of economic study. His remarks in this connection display considerable acumen, and though his methods and erudition have been severely criticised, he deserves great credit for seeing at an early stage the necessity of treating many problems from a historical rather than an abstract standpoint. E. C. K. G.

**NATION.** This word is used in a loose sense to signify any considerable aggregate of human beings, living together in one country, or under one rule. They are generally assumed, with more or less accuracy, to be of one race; but if other bonds are sufficiently powerful to have the same uniting effect as those of blood, the community so held together is regarded as a nation, though its people may spring from various stocks. Thus, we call the Swiss a nation, as well as the French, the Germans, and the Italians. Yet in Switzerland there are French cantons, German cantons, and Italian cantons, in which, not only do the bulk of the people belong to the stock indicated by the name, but they speak the French, Ger-

man, or Italian language, as the case may be. The inhabitants of Switzerland are of different races, and use different tongues; but the political ties between them are so strong that they are constantly referred to as a nation. On the other hand, we often find that in common discourse governmental bonds are neglected where the term we are considering is used. No one calls the people of the Austrian empire a nation, though they all owe political allegiance to the occupant of the throne of the Hapsburgs. The usual phraseology describes Austria as a state made up of a number of nations or parts of nations—Germans, Magyars, Slavs, Poles, etc. Between the two ideas, that of blood-unity and that of administrative unity, ordinary speech hovers. The same person who has just mentioned Germans as one of the nations of the Austrian empire, will go on to maintain that the realisation of German unity under the Hohenzollerns in 1871 gave the German nation a leading position in Europe. In the first case he will be thinking of race only; and in the second, of race plus political allegiance. In fact, there is no generally received definition of a nation. Common descent, common language, common history, common religion, common interests, common ideas, hopes, and aspirations,—all these enter more or less vaguely into the current conception, but any one of them may be wanting, or two or three of them may be absent together, and yet the community which lacks them may be called a nation. Its people must, however, possess what Renan rightly regards as essential to nationhood, a common heritage of memories and feelings, and a present desire to continue their common life. A curious reversal of ordinary practice is furnished, at least as far as formal and official terminology goes, by the United States of America. Its people cherish in a remarkable degree the characteristics enumerated above, but their written constitution nowhere applies the term *nation* to them; and a few years ago, a proposal to introduce into the liturgy the versicle "O Lord, bless our nation," was defeated in the convention of the American Protestant Episcopal Church (see Bryce, *American Commonwealth*, ch. ii.). But it must be added, that in common speech and writing the Americans constantly call themselves a nation. If it be necessary to assign a technical meaning to a term so loosely used in ordinary discourse, we may perhaps conveniently define a *nation* as a community whose members are bound together by ties of blood, speech, feeling, and interest, such as do not subsist between them and the rest of the world, and who are also under a common government. This leaves us the term *nationality*, for aggregates of human beings who feel the ties referred to, but do not form one political whole (see *NATIONALITY*), and enables us to distinguish a *state* from a *nation* or a

*nationality*, by laying stress upon the mere fact of political authority without reference to the conditions under which it is exercised (see *INTERNATIONAL TRADE*).

## NATIONAL DEBT.

1. Introduction, p. 2; 2. National Debt of United Kingdom, p. 3; 3. The Funding System, p. 4.

### 1. Introduction.

The economic evolution of the system of borrowing by the state proceeds along the same lines as the development of commercial credit in the community. The system of accumulating treasure against unforeseen emergencies was adopted by the ancient world, and is not unknown at the present time. Forced loans were the favourite expedient of mediæval monarchs. Anticipation, or pretended anticipation of taxes was the next step. As industry and independence increased, the despotic methods of the middle ages became intolerable. The growth of private credit suggested the use of public credit; the growth of public debt naturally followed. Holland, as the logical result of its advanced commercial development, was the first nation to contract public debt systematically. England and France followed more slowly. States whose commercial history, if not their existence, is more modern, have found a facility of incurring national debt ready made, so to speak, for their adoption. Consequently this method of acquiring ready money without trouble has been grossly abused, especially by the South and Central American Republics, which obtained large loans without the possibility of paying them, and for purposes utterly wasteful and corrupt.

The general questions of the gradual rise of public borrowing, its effects on industry and thrift, the policy of borrowing in national emergencies rather than increasing taxation, are explained in the article on *DEBTS, PUBLIC*; a very good statement of them will also be found in M'Culloch's *Taxation and the Funding System* (1st ed., 1845).

(a) It is sometimes suggested that a national debt should be permanent. But it is essential to pay it off as soon as possible. The old theories as to the benefit of having a large debt for purposes of investors are not yet exploded in commercial circles, but no economist could be found to support them. On this head see the essay, referred to below, in which Sir R. Giffen showed the propriety of making a serious effort to reduce the national debt of Great

Britain. With increasing population and wealth in any given country, the burthen of a debt previously incurred becomes proportionately less, and its repayment would therefore become easier. It is, however, matter of history that but few countries which have once incurred a debt have made the necessary effort to repay it. The reduction of the debt of the United States is the most striking instance of the recognition of this public duty: but in this case rapid development made the task specially easy. The high credit of many of the British colonies is partly due to the fact that from an early period in the currency of a loan provision is being made for its ultimate repayment. This point will be treated of under SINKING FUND.

(b) What is to be considered a heavy debt? The usual test is to compare the debt per head of population in various countries. This is done exhaustively in the article on DEBT, PUBLIC, STATEMENT OF. But it would probably be safer always to compare the proportion of the debt and debt-charge to the annual revenue. Even this fails, for a wealthy people can raise a given annual revenue with much less effort than a poor people. The real burthen of debt is a subject for close local inquiry.

The term "national debt," has been confined in practice to denoting debt owing from a state as an international unit to its own subjects or to foreigners. But debts incurred by municipalities and other local bodies are equally burthens on the industry of the nation; and there are few civilised nations which have not contracted some such. In the case of Great Britain such debts amount to about £260,000,000, or 31 per cent of the national debt proper; in the Australian colonies to at least £11,500,000, or  $5\frac{1}{2}$  per cent of the public debt.

## 2. National Debt of United Kingdom.

Probably the last of the forced loans under the privy seal was obtained by James I. in 1604. After the Restoration the favourite method of raising loans was by the issue of tallies in anticipation of revenue. When William III. became king the only recognised debt was £84,888 : 6 : 9, borrowed on tallies in anticipation of duties on French linens. The increase of debt during his reign, which is amply capable of justification, led to "tallies of fictitious loans," and the issue of annuities for lives and terms of years, as well as to the creation of the permanent form of funded debt which gradually superseded all other methods. The low state of public credit at this time is illustrated by an unsuccessful attempt in 1692 to borrow one million on annuities for ninety-nine years at 10 per cent for eight years, and 7 per cent for the remainder of the term. William's government, however, took the first

steps to establish public credit: the "banker's debt," raised and repudiated by Charles II. (see EXCHEQUER, CLOSING OF), was finally made part of the national liabilities in 1699: the Bank of England debt, which had its origin in this period, brought ulterior benefits with it.

The following figures account for the greater part of our national debt.

Incurred during William III.'s reign (1688-1702)	£15,730,489
Anne's reign, war of Spanish succession, etc. (1702-13)	37,750,667
American War (1775-86)	121,267,993
French War (1793-1815)	603,842,171

During the whole period the obligation of repayment was more or less borne in mind; but the net result of the operations in this direction was not very effective (see SINKING FUND).

The national debt of the United Kingdom, as it has stood during the last century, is composed of funded and unfunded debt.

(a) The funded debt comprises the debts on account of Bank of England and Bank of Ireland stock, and the South Sea and old East India companies, each of which has an interesting history. It reached its highest point in 1817, when it stood at £796,200,191 (the unfunded debt making up the total national debt of £848,282,477): since that time it has fairly steadily decreased except during the Crimean war. It stood in 1894 at £634,707,994, including the TERMINABLE ANNUITIES. Several schemes of recent years have been directed towards the reduction of capital or interest: the chief of these are the conversion of certain portions of the debt into terminable annuities and Viscount Goschen's conversion schemes of 1888-89, which chiefly affected the annual charge of debt. The national debt commissioners, first constituted under an act of 1786 (26 Geo. III. c. 31), the members *ex officio* being the Speaker of the Commons, the Chancellor of the Exchequer, the Master of the Rolls, the Paymaster-General, the Governor and Deputy-Governor of the Bank of England, have under them a permanent department, which is charged with the management of annuities and the purchase and cancellation of portions of the debt.

(b) The unfunded debt consists of issues of loans for short periods now usually made in order to supply the wants of the state in anticipation of the incoming of the ordinary revenue. It is often referred to as "FLOATING DEBT." It is created in three forms (1) EXCHEQUER BONDS, which have currency for a fixed term of years, not now usually exceeding three, but were first issued in 1853 with a currency of forty years. (2) EXCHEQUER BILLS which run for a few weeks or months as a minimum, and are thereafter liable to be called in at any time. (3) TREASURY BILLS, which are not very dissimilar

from the preceding class. The essential difference between Treasury bills, Exchequer bills and bonds, and funded government securities, is that on the former the State contracts to pay the principal as well as interest, and on the latter the interest only. The amount of unfunded debt in 1894 was £21,446,300 against a funded debt (excluding annuities) of £587,631,096; the average of the three years 1890-92 was over £34,000,000, or more than double the average of the seven previous years. But in the first quarter of 1892-93, £13,000,000 of the floating debt was funded.

The annual *Statistical Abstract* gives an interesting table showing the movement of the debt during the previous fifteen years. In 1880 the aggregate net liabilities of the United Kingdom were £739,501,605, in 1890 they were £684,954,150, and 1894, £664,163,141. The South African War and trouble with China increased this amount to £770,778,000 by 1903, reduced in 1907 to about £743,306,000.

### 3. The Funding System.

Any sketch of the history of Great Britain's debt would hardly be complete without some more particular reference to this term. The term "to fund" properly meant nothing more than to undertake a liability for the debt which in point of time should be indefinite, and therefore practically permanent; and to record it as such in the accounts of the state. This term apparently came into use in this country in the latter part of the 17th century, so that the popular title of "the funds" may be considered contemporaneous with our national debt itself. But in practice it became common in the early part of this century to associate the term with undertaking the liability for a greater nominal amount of debt than the amount actually lent to the state; and it was this form of inducing persons to lend money to the state which is specially indicated in the term "funding system." This expedient, resort to which was the natural result of the difficulty of raising loans, appears to have been first adopted in the year 1758: it afterwards became popular. The excess of capital liability incurred by the plan amounted to 75 per cent of the loans raised in 1781 when, in return for £12,000,000 in cash, the State issued stock to the amount of £18,000,000 at 3 per cent and £3,000,000 at 4 per cent, or £21,000,000 in all; this seems to have been the greatest of such excesses. This was the method which gave its particular meaning to the words "funding system"; but it was a mere accident of the system, and not of its essence. The method concentrated a great deal of criticism on itself, and was usually charged with gross extravagance (see M'Culloch's *Taxation and the Funding System*, pt. iii.): but to support the charge, it would be necessary to examine all the circumstances which bore on each issue of a loan.

The commercial principle on which it is based is seen daily at work in the stock exchange prices, which are usually below or above par. Further it is constantly adopted in inviting tenders for colonial or foreign loans where subscriptions are called for at a minimum of say £96 or £98 for every £100 stock: and of the colonial loans at any rate it may safely be stated that all future as well as present contingencies are considered before such minimum prices are fixed; considerations of the rate of interest are of course a potent factor.

The amount of cash received for an obligation has an important bearing on the morality of writing down the nominal capital of the loan in the case of a poor state. For a full statement of the debts and charge of debt of the British Empire and foreign countries, see article on DEBTS, PUBLIC.

Excellent statements of the growth of the debt are found in *Fenn on the Funds*, and full information on many points in a *House of Commons Return* of 1869, 366, i., app. No. 13.—*Part. Returns of the National Debt*, especially 443 of 1858, 366, i. of 1866, 312 of 1894.—Bastable, *Public Finance*.—Adam's *Public Debts*.—Giffen's *Essays in Finance*, 1st Series, Essay xi.] C. A. H.

### NATIONAL DEBT, REDEMPTION OF. See REDEMPTION OF NATIONAL DEBT.

NATIONAL ECONOMY (and the German terms *Staatswirtschaft* and *Volkswirtschaft*, more or less equivalent to it) is used by many economists to designate that stage of development in which the economic life of an entire nation, or state, forms a united whole. It is distinguished from the preceding stages of a territorial or provincial economy (or, where a country did not go through that experience, of a town economy), and from the stage which may possibly follow in the future, of an international economy. Different writers lay stress on different characteristics; some, like Schmoller, upon the national regulation of industry and trade; others, like Bücher, upon the widening distance between producer and consumer, and the larger "circulation of wares." But these various features have been historically interdependent. The widening of the area of economic dealings between individuals has facilitated the substitution of national for local control; and the reverse is equally true. • •

"National economy" (*Nationalökonomie*) is also one of the several German designations of the science of political economy.

[G. Schmoller, *Studien über die wirtschaftliche Politik Friedrichs des Grossen*, in his *Jahrbuch*, N. F. viii. (1884), pp. 17 ff.; trans. under the title *The Mercantile System and its Historical Significance* (1896).—K. Bücher, *Entstehung der Volkswirtschaft* (1898), pp. 15 ff.—Ashley, *Econ. Hist.*, pt. i. 206, pt. ii. 7, 9, 42, 43.] W. J. A.

NATIONALISATION OF LAND. See LAND, NATIONALISATION OF.

NATIONALIST (U.S.A.). The term applied to a social reform movement crystallising in the United States about 1888, favouring collectivism and management of industries by the government. It had its centre in Massachusetts, and was in a considerable measure the result of the publication of *Looking Backward* (1888) by Edward Bellamy. Societies were formed in various parts of the United States, some of which still exist.

A magazine was established entitled *The Nationalist*, of which three volumes were published; 1890, pp. 274; 1891, pp. 346; 1892, pp. 576. This movement is educational rather than political, resembling the attitude of the Fabian Society in England. Its views have also been represented in a weekly publication in Boston entitled *The New Nation*, edited by Mr. Edward Bellamy, which has now suspended publication. D. R. D.

NATIONALITY. "A portion of mankind may be said to constitute a nationality if they are united among themselves by common sympathies, which do not exist between them and any others—which make them co-operate with each other more willingly than with other people, desire to be under the same government, and desire that it should be government by themselves or a portion of themselves exclusively." With these words John Stuart MILL opens the chapter on nationality in his work on *Representative Government*. He goes on to analyse the influences which unite peoples among themselves and make them wish to form one body politic. Race, religion, language, local contiguity, and "identity of political antecedents" are all-important, though it is quite possible that one or more of them may be absent when the feeling of nationhood exists, or present when it does not exist (see NATION). When a nationality has been placed under one rule, and that the rule of some of its own members, it may conveniently be called a nation. The doctrine of nationality asserts that liberty, progress, and order are best secured when states and nationalities coincide. It maintains that all the individuals who compose a nationality should live under the same government, or in other words that nationalities ought to be nations. In one sense it is a revival of the old theory of political union through blood-relationship; but it includes the more modern notion of territorial sovereignty, since its advocates hold that the districts inhabited by men of the same race should, as far as possible, be placed under the same rule. It came into being as a protest against the doctrine of a balance of power, which divided provinces among states without regard to the wishes or political affinities of their inhabitants. It has modified immensely the state-system of modern Europe. Mazzini

made it the gospel of the champions of Italian freedom. It helped to unite the German peoples into one powerful empire. The pan-Slavonic and pan-Hellenic movements owe their vitality to its inspiration, and each is a force which statesmen know they have to reckon with in the future. In its crudest form it assumes what is not true, and asks for what is not possible. Community of language does not prove community of blood. Race is not the only bond which brings men together in political union, still less is it so sacred that all arrangements made in derogation of its claims are internationally null and void. Outlying parts of a nationality are sometimes separated from the bulk of their fellows by realms inhabited by men of different blood. In some territories races are so mixed that it is difficult to say what nationality prevails. But as stated and guarded by J. S. Mill, the doctrine does but express the commonly accepted view that a people sufficiently distinct from other peoples to form a distinct nation should be ruled according to its own wishes.

[J. S. Mill, *Representative Government* (1878), ch. xvi.—Maine, *Early History of Institutions* (1874), Lect. iii.—Woodrow Wilson, *The State* (1889, Boston, U.S.A.).—Mazzini, *Life and Writings* (London, 1864).—Bluntschli, *Allgemeine Staatslehre* (Stuttgart, 1875), bk. ii. chs. iii. iv.]

T. J. L.

NATURAL AGENTS. See AGENTS OF PRODUCTION.

NATURALIZATION. Down to 1844 (7 & 8 Vict. c. 66), the only way of passing from the condition of alien to that of natural-born subject was by act of parliament which, if private, naturalized certain people; if public, naturalized classes of people. In 1844 naturalization by certificate of the home secretary was introduced and has superseded the older method. The act of 1844 is replaced by that of 1870, 33 & 34 Vict. c. 14, under which any alien who has lived five years in the United Kingdom, or has served the crown for that period and wishes to continue doing so, may apply to the home office; he must prove the facts on which he relies by "statutory declaration," and must pay £5. 5s. in fees, and must swear to be faithful to the British Sovereign. The Home Secretary may, at his discretion, refuse the certificate. From 1609 to 1825 an oath declaring the king supreme head of the church, and the taking of the sacrament according to the ritual of the established church was as a rule exacted, but in the American colonies and Ireland, Protestant dissenters need not observe the latter form; the first condition was abrogated by the acts of 1844 and 1870, and the second by the act of 1825. Colonies are authorized by acts of 1847 and 1870 to make their own naturalization laws.

(1) A peculiar interest attaches itself to the objects with which acts naturalizing classes of people were passed. A. Smith, after mentioning 5 Geo. I. c. 27, and 23 Geo. II. c. 13, under which the exportation of "living instruments of trade"—in other words the emigration of artificers—was forbidden, writes: "I do not observe at least in our statute book any encouragement given to the importation of the instruments of trade" (bk. iv. ch. viii. ed. 1890, pp. 502, 516). We can here supply A. Smith's omission. The English act of 1663 (15 Car. II. c. 15), after reciting that "vast quantities of linen, cloth, and other manufactures of hemp and flax, and of tapestry hangings are daily imported into this kingdom from foreign parts to the great detriment and impoverishment thereof, the monies and quick stock of this kingdom being thereby daily greatly exhausted and diminished," naturalized Protestant manufacturers of these articles if they would reside in England three years. Even the Irish plantation acts expressed the same economic object when they offered citizenship to any one who would condemn papal doctrine and acknowledge the royal supremacy; thus the Irish act of 1662 (14 & 15 Car. II. c. 13), begins: "Whereas much coin and ready money is carried out and transported for buying and purchasing of foreign manufactures, to the great exhausting and diminishing the treasure of this kingdom." Similarly the acts of 1732 (5 Geo. II. c. 28), etc., which naturalized foreign Protestants who served in the Greenland fisheries, etc., were passed in order that England might import commodities such as blubber without exporting money. The Fishery and Irish Acts were animated far more by political than by economic motives, but the MERCANTILE SYSTEM and the theory of the BALANCE OF TRADE are one root of those acts, and the taproot of the act of 1663. These acts were repealed by the Statute Law Revision Act 1863 and by the act of 1870, but had died a natural death at least half a century before. Other naturalizing acts were passed from time to time to carry out the pre-Malthusian idea that numbers meant wealth as well as strength (7 Anne, cap. 5, xiii.; George II. cap. 7 (preambles), and see *Reflections upon Naturalization, etc., by a Country Gentleman*, 1753. (2) Secondly as to the effects of naturalization, Francis Bacon wrote: "There be but two conditions native and alien—nam tertium penitus ignoratur." The first hint of an intermediate class is in the act of 1663, which taxed aliens naturalized under that act still as aliens, when they traded with foreign parts. The first political barrier between naturalized alien and natural born was raised by an Irish act of 1703, amending that of 1662, which deprived aliens naturalized under the principal act of the vote and of power to be magistrates, officers of a city, or members of parliament. In England, under the Act of Settlement and other acts, naturalized aliens (a) could not after 1714 be members of parliament nor of the privy council; (b) nor fill any office of trust; (c) nor receive grants of crown lands. The first disability (a) continued until 1870; (b) and (c) until 1844. A naturalized alien may still find himself at disadvantage if he visits his old country or a colony.

[Pollock and Maitland, *History of English Law* (1595), bk. ii. ch. ii. § 6 (medieval).—G. Hansard, *Treatise on the Laws relating to Aliens* (1844) (modern English).—Henry Wheaton, *Elements of International Law*, ed. A. C. Boyd, 3rd edition (1889), § 82a (see ALIENS; DENIZEN).] J. D. R.

NATURALIZATION IN THE UNITED STATES. The constitution of the United States (art. 1, § 8) gives congress power to "establish a uniform Rule of Naturalization." The law of 26th March 1790 permitted naturalization after two years' residence, upon application to any common-law court of record and the taking of an oath of allegiance. In 1795 the law was revised so as to provide for a preliminary declaration of intention to become a citizen, to be made three years before admission to citizenship, and requiring a total residence of five years. Owing to the hostile feeling against the French, which became so violent toward the close of Washington's administration and during that of John Adams, an exceedingly stringent law was passed in 1798, providing that the declaration of intention to become a citizen must be made five years before admission to citizenship, and that the applicant must prove a residence of fourteen years in the United States, five in some one special state, before admission. This law was an outcome of the same feeling that led to the passage of the alien and sedition laws, which from their unwise severity were the chief influence in bringing about the downfall of the Federal party. Less than four years later, in 1802, the law was amended providing that the declaration of intention must be made three years before admission, and that the total period of residence should be five years. The law required, in addition to the usual oath of allegiance, also an abjuration of allegiance to any foreign ruler.

Though there have been since that time some slight changes, the law remains substantially the same, with the exception that the declaration need be made only two years before final admission as a citizen. Several provisions have been made regarding special classes of citizens. For example, during the time of the civil war it was provided, in 1862, that any honourably discharged alien soldier might be admitted to citizenship without previous declaration, upon proving one year's residence. Children of persons naturalized become citizens if under twenty-one years old at the time of parents' naturalization. Any alien under twenty-one who has resided in the United States three years before arriving at that age, may be admitted after five years' total residence without previous declaration of intention.

The right of naturalization in the United States carries with it all the rights of native citizens, with the exceptions that the President and Vice-president of the United States must be native born; and that the naturalized

citizen cannot serve as a United States senator until he has been a citizen of the United States nine years, or as a member of the House of Representatives until he has been a citizen seven years. The power to vote for the President and members of Congress in the United States depends upon the right given by the individual states to vote for members of the lower house of their legislatures, and no fewer than sixteen states grant this right to vote before the alien becomes naturalized. In one case, Indiana, if the alien has declared his intention of becoming a citizen and has resided one year in the United States and only six months within the state, he may vote. Minnesota requires only one year's residence and declaration of intention. In all these sixteen states an alien must have declared his intention of becoming a citizen; the period of residence varies from six months to four years. Twenty-eight states require that a man become a full citizen before he is permitted to vote. There can be no doubt, however, that even in some of the states where naturalization is insisted upon as a pre-requisite to voting, many frauds have been committed by political leaders for the sake of securing the too early naturalization of aliens in order that their votes may be obtained.

Many questions arose some years ago between the United States and several of the European states regarding the protection that should be extended by the United States to naturalized citizens abroad, especially in the state from which the naturalized citizen had emigrated. Several of the European countries, particularly Germany and Austria, insisted upon holding for military duty those persons who, before serving their regular period in the army, had emigrated to the United States. The United States, on the other hand, if the emigrants had become naturalized citizens, insisted upon protecting them against the government of their native country. In 1868 congress passed an act providing that "all naturalized citizens while in foreign states shall be entitled to and shall receive from this government the same protection in person and property as is accorded to native-born citizens in like situation and circumstances," a practical repudiation of foreign claims. Within the next three years treaties were negotiated with the leading countries concerned—England, Austria, Baden, Bavaria, Belgium, and others, which removed all such causes of controversy. States that before had not recognised the right of expatriation, under these treaties recognised it, with the proviso in ordinary circumstances that, if the person concerned had left unperformed, at the time of his emigration, any obligation then due to his native state, he might be held to the performance of that obligation, but of no other; or if he had committed any crime against that country

he should be held for punishment. In one instance, the evasion of military duty was specifically mentioned. In certain cases, notably in that of Martin Koszta, the United States has extended a certain amount of protection in foreign lands to aliens who, not yet fully naturalized, had when resident there formally declared their intention of becoming citizens of the United States; but obviously this protection could not be carried far against the person's native state.

The necessity imposed upon the United States of protecting its naturalized citizens has been greatly increased by the great immigration into that country; and its readiness in granting such protection has doubtless had much influence in liberalising the views of other countries regarding the right of expatriation.

J. W. J.

NAVARRETE, PEDRO FERNANDEZ (end of 16th and early 17th century), was chaplain to the royal family of Spain, and an officer (*consulador*) of the Inquisition. The miserable state of Spain had led the supreme council of Castile to submit to King Philip III. a Great Report (*Gran Consulta*) on the remedies to be applied; this report was delivered on February 1619, and gave rise to fifty *Discursos* or glosses from Navarrete, printed in 1626 at the royal press, and several times reprinted since under the title of *Conservacion de Monarquias*. They are included in Rivadeneyra's *Bibl. de Aut. Españoles* (vol. xxv., Madrid, 1853).

Though a long-winded writer and rather too fond of learned quotations, Navarrete shows himself in many respects free from contemporary national and religious prejudice. Speaking of the expelled Moors, he says, "I am certain that if before driving them to desperation, it had been sought to admit them to some honourable offices without any note of infamy, it is possible that they might have been willing to be received in the Holy Church through the gate of honour" (*Discurso VII.*). In the same discourse, he wonders whether all the Irish refugees were bred to be noblemen as they show such reluctance to labour. He ascribes the depopulation of Spain to the numerous continental wars, and the passion for adventures excited by the discovery of America (*Disc. VIII.*) as well as by the ingrained indolence of crowds of vagrants "who are seen playing at cards the whole day in the streets of Madrid, awaiting by day the hour to be fed at the gates of convents, and by night to commit burglaries" (*Disc. IX.*). For a remedy he recommends the development of manufactures as in France, Italy, and the Netherlands, "which are rich countries, though they reap neither gold nor silver," and, "because human labour adds additional value to the primary value of natural produce" (*Disc. XVI.*). It would be useful to admit foreign artisans, provided they were not allowed to carry away all

their acquired wealth (*Disc. XVII.*). There are too many *mayorazgos* (entailed estates) (*Disc. XI.*), too many noblemen (*Disc. XXI.*), too many holidays; in some bishoprics, they cover one-third of the year, without including bullfights and public rejoicings (*Disc. XIII.*). He sees no possibility of levying new taxes (*Disc. XIX.*), and considers that as regards sumptuary regulations "example (of the magnates) is better than imperative laws" (*Disc. XXVIII.*). In his fiftieth and last discourse, he concludes with a truth not much appreciated in the Spain of his days, namely that "the councillors of kings ought not to be like cooks, who only think of dishes to please the palate, but like physicians, who prescribe bitter and stringent pills and potions." E. ca.

NAVARRUS DE AZPILCUETA, MARTINUS (d. 1586), one of the most distinguished Roman Catholic theologians and canonists of the 16th century, was a Spaniard by birth, and, after a long career as professor at Tolosa, Salamanca, and Coimbra, resided in Rome for six-and-twenty years until his death. To the economist he is of interest on account of his extremely liberal teaching in the matter of usury (see CANON LAW; INTEREST AND USURY). He not only justified the triple contract (see ECK, JOHANN, who also explained the principle on which, through the *Contractus Trinus*, the payment of a certain percentage for the use of money was held to be lawful), but was the first considerable theologian on the Roman Catholic side, as MELANCHTHON (*q.v.*) was the first on the Protestant side, to maintain that MORA or delay needed not to be proved to justify the payment of compensation for "interest."

[For an account of him and of his *Manuale Confessoriorum*, see W. Endemann, *Studien in der romanisch-kanonistischen Wirtschafts- und Rechtslehre* (1874), i. 47, *et frequenter*, and, in English, Ashley, *Econ. Hist.*, i. pt. ii. 453.]

W. J. A.

NAVEAU, JEAN BAPTISTE (1716-1762), was a French official.

He wrote the *Financier Citoyen*, Paris, 2 vols. 1757. Although criticised by Voltaire in *l'Homme aux Quarante Ecus*, Naveau's book is still useful to consult on account of its copious information (Stourm, *Diet. Hist. des Finances*, 1895, p. 97).

NAVIGATION ACTS. See NAVIGATION LAWS.

NAVIGATION CLAUSE. This is the clause found in many commercial treaties, whereby the privileges granted to the merchandise of the contracting powers are limited to goods carried by the ships of the powers or other privileged ships, or by certain fixed routes. This must be distinguished from the grant of reciprocal treatment to the ships of each power in the ports of the other. C. A. H.

## NAVIGATION LAWS

I. History, p. 8; Chief provisions, p. 9. II. Policy, p. 10: (a) Naval Aspect, p. 10; (b) Commercial Aspect, p. 11.

Navigation Laws was the short title of a series of enactments designed to restrict the carrying trade of Great Britain to ships and sailors of native birth.

### I. HISTORY

So far as we can ascertain, the idea of so restricting trade did not occur to the ancients, and Macpherson is correct in stating that the first instance of a navigation act was that of James, king of Aragon and count of Barcelona in 1227. This act prohibited all foreign vessels from loading goods at Barcelona for Alexandria and other parts unless no vessels belonging to Barcelona were ready and competent to perform the voyage. The object was to crush the trade of the Catalans to the Levant.

The first navigation act of the English parliament was 5 Ric. II. c. 3 (1381). In order to make better provision for an efficient navy, it enacted that no subject of the king should ship any merchandise outward or homeward, except in "ships of the king's allegiance," under penalty of forfeiture of the vessel and cargo. Within a year it was found necessary to modify this stringent enactment by the proviso, evidently borrowed from the Spanish act above mentioned, that it should be lawful to ship in foreign vessels if English could not be found.

A Scottish act followed this; it is not on record, but it was temporarily suspended for a year by an act of 1428, which allows Scottish merchants for that one year to ship in foreign vessels where Scottish are not available. At this period Scotland usually followed England closely in such a policy.

The policy which dictated these acts was a product of an age which assumed that everything could be effected by a king's decree, and viewed any progress on the part of another nation as a danger to England (cp. COMMERCE; EXPORTS, DUTIES ON). But occasional references show that the act was not entirely successful, and the attempts made from time to time to strengthen it point in the same direction. In 1485, a law was enacted for one year, that no one should buy or sell French wines unless imported in vessels belonging to England, Ireland, or Wales, and navigated principally by natives of England, Wales, Ireland, or Calais (this last is an interesting "footnote to history"). And in 1489, avowedly on account of the decadence of the English marine, a new act was passed to prohibit the charter of foreign vessels, except where there was no room for freight on English vessels. This last act seems to have fallen into disuse and was re-enacted in 1541.

A notable reversal of the policy took place in the first year of Elizabeth's reign (1558).

Since the making of the statutes," the preamble ran, "other sovereign princes, finding themselves aggrieved by the said acts, as thinking that the same were made to the hurt and prejudice of their country and navy, have made like penal laws . . . by reason whereof there hath not only grown great displeasure between the foreign princes and the kings of this realm, but also the merchants have been sore aggrieved and endamaged"; the growth of illicit traffic was also cited, and the law abolished prohibitions and made the ports of England open to foreign shipping on payment of a higher duty on goods so imported. Various breaches in this policy, even during Elizabeth's reign, were made from time to time to suit certain ideas, such as discouraging the export of corn, or to please special interests such as the TURKEY COMPANY (*q.v.*).

In 1646, the old idea re-asserted itself; the Long Parliament enacted that no duty should be levied on goods intended for the plantations, provided they were shipped in English bottoms. In this act, Macpherson finds the foundation of the navigation acts, which he hails as the "commercial palladium of Great Britain" (vol. ii. p. 431). Five years later, parliament determined that no merchandise, either of Asia, Africa, or America, including our own plantations, should be imported into England in any but English-built ships, belonging to English subjects, navigated by English commanders with three-fourths of the crew English. This is the first Navigation Act usually so styled. It was aimed against the Dutch, who were then on a free-trade basis, not only doing the carrying trade of Europe, but attracting English sailors into their service.

#### *Chief Provisions of Acts.*

As, however, this law was an enactment of the Commonwealth, it is the act of 1660 (11 Car. II. c. 18) which is usually called the Navigation Act, the *Charta Maritima* of Great Britain according to Sir Josiah Child. Its chief provisions were:

- (1) The prohibition of importation or exportation into or from the plantations, except in national ships with English commanders and with at least three-fourths of the crew Englishmen.
- (2) The prohibition of foreigners from becoming merchants or factors in the plantations.
- (3) The prohibition of the importation of goods, the growth or produce of the plantations into England "but in such ships as doe truly belong to English people" and navigated as above.
- (4) Restriction of the coasting trade to English owners only.

- (5) The chief products of the English colonies to be shipped only to England, Ireland, or other plantations.

There were other restrictions and conditions which do not need mention here. The Scottish parliament followed suit in 1661, but wisely, amongst other exemptions, made the act inapplicable to the case of corn in time of dearth. In 1663 (14 Car. II. c. 11) an important extension of the act became law, excluding from the privileges of English ships all foreign-built ships, even if owned in England and manned as required by the act of 1660. This act also encouraged armament in Mediterranean vessels, chiefly because of the Barbary pirates.

For nearly two centuries the principle of these acts dominated the policy of England towards its shipping interests; it was interwoven in all acts whose chief object was the general restriction of trade to English channels, as in that of 1663, which required all commodities shipped from the plantations to pass through England to their destination. In 1675 it was found necessary to issue a proclamation to enforce the acts; in 1696, an attempt to re-enact them was made. All this shows that there was a good deal of evasion. On the other hand a sense of the weakness of the policy was shown in the partial relaxation of the acts in 1665 and 1693, in order to help English merchants to recover some share in the Greenland whale fishery. But public opinion was, on the whole, strongly in favour of the acts; hardly a voice except Richardson's (in 1750) was raised against their policy during the whole of the 18th century. The first organised attack upon them came from the colonies, and particularly the West Indian colonies, after the severance of the United States.

When the American colonies declared their independence, it seems to have been foreseen that their large trade with Great Britain, which had been fostered by artificial restrictions, would at once be lost if it were put on the footing of other foreign trade; accordingly American ships were, for the purposes of the direct trade, put on the footing of British ships. This amounted to a suspension of the navigation acts as regards this trade; and though at the time it attracted little attention, it was afterwards severely criticised as such. The order in council of 2nd July 1783, which conceded this favour, confined trade with the West Indian colonies to British ships, endeavouring to force it out of its natural channel, viz. with the republic of the United States to Canada and Nova Scotia. The West Indian colonies were not long in appealing against a restriction which, amongst other evils, made their supplies dearer and more precarious. On the 19th Nov. 1783, the legislature of Jamaica protested, and Barbados

and Antigua followed suit. The matter was referred to the Trade and Plantations Committee in 1784, and again in 1791. They gathered information and evidence, and issued rather indeterminate reports, the gist of which was, in fact, that more harm was being done to America than to Great Britain. The matter dragged on from year to year, partly postponed by the frequent state of war, during which the navigation acts were continually suspended, as in 1803 and 1806. Very strenuous attacks were made by the shipowners upon these suspending acts, but no serious inroad was made on the principle of the navigation acts till Mr. HUSKISSON took the question up in 1821. He argued it very clearly and successfully. By an act of 1822 (3 Geo. IV. c. 44), the colonies were for the first time allowed to export their produce to any port, provided it were carried by British ships, and even in ships of the port for which it was destined, if that port was in one of the United States. By the same act a still more important step in advance was made; the old prohibition against the shipping of goods from the ports of certain European countries—notably the Netherlands and Germany—was at last abolished. In 1825 Mr. Huskisson carried a further reform, closely connected with his policy of reciprocal trade arrangements with other European countries; it was made legal to import the produce of any country in a ship of that country as well as in a British ship; the privilege which had been granted first to the United States, and then to Portugal, was made general, though with some sort of stipulation for reciprocal treatment.

The act of 1825 (6 Geo. IV. c. 109) practically brought the navigation act to that final form in which it was the subject of so much debate after the free-trade movement was established. The act was consolidated and re-enacted in 1833, and again in 1845 (8 & 9 Vict. c. 88). The latter was the last navigation act: it restricted the importation of certain enumerated articles to British ships or ships of the country in which these articles were produced; it prohibited the importation of the produce of Asia, Africa, and America, from any European port in any ship; it confined the trade between all parts of the British empire to British ships; and it required that a British ship should be navigated by a British master and a crew three-fourths of whom were British. The act should be read with those relating to the registration of ships and of seamen.

But every year the restraint became more irksome. The colonies and foreign countries were alike protesting, and volumes of bluebooks were filled with memorials. In 1847 the House of Commons appointed a select committee to consider the subject: five times

they simply reported the evidence which they had taken; the conflict of testimony was so great that they seemed unable to proceed to a report. In 1848 the House of Lords did exactly the same. But in 1849 the movement in favour of repeal could no longer be withstood: by the act 12 & 13 Vict. c. 9, the old navigation acts and their policy were swept off the statute book as from the 1st of January 1850.

## II. POLICY.

The beneficial results claimed for the navigation acts by their defenders were two, viz.:

*a.* That they secured England's naval supremacy by forcing her people to become sailors.

*b.* That they laid the foundation of England's commercial greatness.

Even ADAM SMITH, pointing out that they probably had their origin in national animosities, wrote of them—"They are as wise as if they had been dictated by the most deliberate wisdom."

### (*a*) *Naval Aspect.*

In making that statement Adam Smith was evidently thinking chiefly of the naval aspect of the question. The opinion that these acts had been the origin of England's naval strength, prevailed to modern times, and was much in evidence before the parliamentary committees of 1848 and 1849. Even at the present day, many would be found to support it. But the better opinion would seem to be that which contests this view. Mr. Labouchere, speaking in the House of Commons in 1848, referred to the above-cited statement of Adam Smith's, as "one of the few errors which Adam Smith ever made." We might expect such authorities as MACGREGOR and PORTER in evidence before H. of C. committee, to be against the contention—but many would pay greater attention to Captain Sir John Stirling's view that the navy had derived no benefits from the acts. It is difficult to produce actual evidence for or against the view in question. A few general considerations certainly shake confidence in it. To go no further back, in Elizabeth's reign, when there was little restraint on shipping, the navy of England proved itself vigorous and efficient, both in the Channel and off the Spanish main. The Dutch, despite the acts, were powerful at sea long after 1650. Soon after the enactment of the Navigation Act, the navy was at the lowest ebb in its history, and Coke, writing in 1671, thinks the act had actually weakened it. And allowing that there is another side to the argument, we may nevertheless cite the facts (1) that in 1740, and again in 1803, one of the most vital provisions of the act, as to the proportion of British seamen, was suspended during war time; and (2) that foreign seamen

were for years employed surreptitiously in the coasting trade of Great Britain in spite of the law to the contrary.

Since the repeal of the acts, there has been no apparent decrease in England's naval strength. Further, the best school for the navy is in the mercantile marine, and that which cramps the development of the latter must injuriously affect the navy. So that Adam Smith himself, when, passing from the passage already quoted, he states that the navigation acts were bad for commerce, appears to furnish a refutation of his own previous statement.

#### (b) *Commercial Aspect.*

This second passage from Adam Smith is as follows: "The navigation act is not favourable to foreign commerce, or to the growth of that opulence which can arise from it." If we could accept as representative the opinion of an ardent supporter of the act, the advocates of the act had no care that it should be favourable to commerce. "Trade," he writes, "was considered principally as the means for promoting the employment of ships, and was encouraged chiefly as it conduced to the one great national object, the naval strength of the country" (*v. Collection of Papers*, 1807, noted at end of article). Not that the loud complaints of the shipping interest, towards the end of last century and onwards, show so much anxiety for the naval strength of the country as for their own private advancement. They would not, in fact, have agreed with Adam Smith. They alleged that the suspension of the acts was followed by decrease in shipping, and that they were at once handicapped in their competition with foreign ship-owners. Some attempt was made to prove this by figures, but we have found it impossible to handle those figures as a simple indication of the separate effect of the navigation laws or their suspension. We can here only give some general statements.

Macpherson triumphantly quotes the Dutch remonstrance against the acts at Breda (1667) as an evidence of their value in wresting the trade from the Dutch; but we find nothing to show upon what lines the remonstrance proceeded, and it is at least as likely that it was directed against the general unfriendliness of the policy and the stringent powers of search given to British officers. It was to the gradual decline of the carrying trade of the Dutch that most of the advocates of the acts have pointed as evidence of their success; but they fail to consider the other reasons which led to the transfer of the sovereignty of the ocean. Thorold Rogers (*Econ. Inter. of History*), free trader as he was, states that the navigation acts of Cromwell transferred the supremacy of the seas from Holland to England.

On the other hand, Macpherson admits that there were very soon loud complaints of the acts from British subjects. Roger COKE (*q.v.*) (1671) states that within two years the act had lost England the Baltic and Greenland trade; and two or three times it was specially waived with a view to the recovery of that trade. Sir Josiah CHILP, the great advocate of the acts, gives much evidence of their impotence and interference with trade. Richardson (1750) found great fault with the working of the acts. A glaring instance of their unfairness is that quoted by the assembly of Jamaica, that in 1783, when there was great distress in the island, there were about 5000 barrels of flour in the harbour which could not be landed because of the provisions of the navigation act. Labouchere cites as a gross instance of their bad effect, a despatch from the government of Trinidad to Earl Grey. "When coolie labour was first proposed to be introduced, American vessels could have been procured to bring them at £9 per head whereas the present charge is nearly £18." More general instances may be found in the evidence before the select committees of 1847 and 1848. And the short allusion to them in the first report of the Commissioners of Customs is a severe condemnation.

That their relaxation did not injure British shipping may be shown from Mr. Huskisson's figures comparing British and Foreign ships entering English ports.

	British tonnage.	Foreign tonnage.
Average of 1814-1823	1,607,948	539,062
" " 1824-1826	1,963,678	804,366
Actual number in 1826	1,950,630	694,116

The increase of British tonnage was greater in proportion than that of foreign tonnage. The year 1826 was one of depression.

That the abolition of the acts did not injure British shipping, is shown by the following returns.

British ships trading to and from English ports.			Foreign ships trading to and from English ports.	
	No.	Tonnage.	No.	Tonnage.
1845	.....	8,546,090	.....	3,581,215
1850	44,698	9,442,544	32,045	5,062,520
1855	45,852	10,919,732	37,695	7,569,738
1860	52,643	13,914,923	50,503	10,774,369
1865	63,170	19,358,955	48,897	9,588,137
1870	70,587	25,072,180	49,116	11,563,002

The proportion of British tonnage in 1845 was 71 per cent; in 1865 it was about 67 per cent; in 1870 barely 70 per cent. Coming to 1880 there were 41,348,984 tons of British

against 17,387,079 foreign, or rather over 70 per cent, and at the present day the proportion remains much the same. As against these figures the only argument to be used is that the numerical increase of British tonnage would have been greater had the acts been maintained. This is contrary to the balance of evidence.

NAVILLÉ, FRANÇOIS MARC LOUIS (1784-1846), was born at Geneva and died at Vernier near that city. He was a Protestant pastor of French extraction; persecution having driven his family from their native land. Like many pastors he occupied himself with education.

In 1829 the French Academy offered a prize on the subject of Charity—two competitors were bracketed equal for it—DUCHATEL and Naville.

Naville's paper, revised and enlarged, was printed under the title *De la charité légale, de ses effets, de ses causes et spécialement des maisons de travail et de la proscription de la mendicité* in 1836, 2 vols. 8vo. The success of this work is due to its methodical arrangement and the clearness of its conclusions. It argues against charity dispensed by the state, in favour of private bounty.

The sincerity of the author is shown in his declaration that when commencing to write he was quite of the opposite opinion, and regarded charity as one of the normal and necessary functions of the state. In working on his subject he felt the instability of the basis of his opinions, and argued against state interference. Within the limits of the subject the work is a masterpiece. A. C. F.

NEALE, EDWARD VANSITTART (1810-1892), Vansittart Neale's active connection with co-operation did not begin till he was forty years of age, though he was ripe for the work by a previous searching study of systems of socialism.

About 1850 he heard of and joined the well-known band of Christian Socialists (see CHRISTIAN SOCIALISM), and became a member of the "Society for Promoting Working Men's Associations" of which the Rev. F. D. MAURICE was then president.

His work for the co-operative cause during forty years was rather of a practical than of a literary character. Yet his literary work was considerable, and included a *Manual for Co-operators* and many magazine articles on social economics, the last, *Thoughts on Social Problems and their Solution*, appearing in the *Economic Review*, October 1892, after his death. He was also a constant contributor to the *Co-operative News*, and numerous pamphlets issued by the Co-operative Union were written by him. His practical work may be classified as follows:

1. *Promotion of Co-operative Societies.* He started the first co-operative stores in London, and the "Central Co-operative Agency," which anticipated, if it did not actually bring about, the present Co-operative Wholesale Society. He took an active part in the formation and management of many societies, distributive and productive, and helped them largely with funds. Amongst other attempts he, with his own capital, tried a large experiment in co-operative production at the Atlas Engineering Works. Though he thus lost a considerable fortune, the sacrifices made by Neale in the cause did perhaps more than anything to keep out class jealousy and distrust from the co-operative movement.

2. *Legal Work*, and especially the promotion of legislation to protect industrial societies. It was chiefly through the efforts of Neale and J. M. Ludlow that the first Industrial and Provident Societies Act was passed in 1852, which gave a legal status to co-operative societies—regarded hopefully by some as the "Magna Charta" of the labouring classes. He shared in the drafting of many amending acts, and was solely responsible for the great consolidating act of 1876. He also gave valuable assistance in framing rules for co-operative societies, notably those of the Co-operative Wholesale Society and the Co-operative Union, and he prepared the model rules under which most societies are now governed.

3. *Work in connection with the Co-operative Union.* With the rapid growth of the Co-operative Wholesale Society's business, it was felt that something other than a successful business concern was required as the "official and recognised representative organ of co-operation in England."

Congresses presided over by Vansittart Neale were accordingly held in London in 1868. They were the forerunners of the co-operative congresses, which are now of annual occurrence, and led to the formation of the Co-operative Union. In all this Neale took a very prominent part, and in 1874 he became secretary of the Union, living in lodgings in Manchester and devoting himself absolutely to the work. He retained this post until within a few months of his death, notwithstanding his advanced age, and his succession to a landed estate, which

would have drawn away most men from such arduous work.

In this position he was at the centre of the co-operative movement in England; he also attended congresses and corresponded with co-operators abroad. He helped to found, in 1884, the Labour Association for advancement of co-operative production and labour partnerships—which still exists.

It is perhaps needless to add that in the great question that threatens a division among co-operators, Neale held that the workpeople employed by co-operative distributive societies, wholesale or retail, were entitled to a share in the profits, and a voice in the direction, instead of being treated like the employés in any ordinary factory or workshop.

E. V. Neale wrote several religious works; among those on co-operative questions are:—*Association and Education: What they may do for the People.—Land, Labour, and Machinery.—The Economic Aspect of Co-operation.—The Three C's Co-operative Trilogy.—May I do what I will with mine own?* 1851.—*The Economics of Co-operation.*

[Henry Pitman, Life, Co-operative Union, Manchester, 1894.—Notice by J. M. Ludlow, *Economic Journal*, vol. ii. 1892; and notices by Judge Hughes, *Economic Review*, 1893 (see also CHRISTIAN SOCIALISM; CO-OPERATION).]

H. Ho.

NEBENIUS, KARL FRIEDRICH (1784-1857), was born near Landau in the Rhenish Palatinate. After studying law at Tübingen, he made himself acquainted with the Napoleonic methods of administration as a volunteer assistant to the prefect at Besançon, but would not accept a place in the French service. He became in 1807 private secretary in the Baden ministry of finance, in 1823 first councillor, and in 1838 president of the ministry of the interior. He supported a liberal policy, but the absolutist party under Blittersdorf gained the ascendancy, and he resigned office in 1839. He declined an offer from Frederick William IV. of a high position in the Prussian service. On the fall of Blittersdorf he became again in 1845 minister president. He retired in July 1849; suffered for some years from failing sight, and died at Karlsruhe.

Nebenius was the leader of reform in Baden for nearly forty years, constructing the new constitution of the state in 1818, creating its railways, remodelling its taxation and domain-management, introducing the metrical system of weights and measures, organising the system of popular instruction, and regenerating the higher teaching, especially in the university of Heidelberg, of which he was curator. But his name is chiefly associated with his energetic and successful efforts for the establishment of the ZOLLVEREIN—an event which Roscher pronounced to have been the most important in German history between Waterloo and Königgratz. List had done much, as a popular writer and indefatigable agitator, to recom-

mend to the national mind the idea of such an institution; but Nebenius studied its conditions, conciliated its opponents, and devised a tariff for the general adoption of its component states, so that he has been justly called its intellectual founder. The perseverance, foresight, and tact with which he worked out the problem, merit hearty approbation.

As a scientific economist he was of the school of Adam Smith, and was an advocate of free trade as the general rule in practice; but he rejected the doctrine of the absolute non-intervention of the state in the industrial world. His principal theoretical work was *Der öffentliche Kredit*, 1820, 2nd ed., 1829, "perhaps," says Roscher, "the best monograph in the whole economic literature of Germany, and certainly the most important treatise on the subject of public debts which has been written in any language." His most noteworthy writings bearing on the question of the Zollverein were his *Denkschrift über das Deutsche Zollwesen*, written and privately circulated in 1819, but not published till 1833, and *Der Deutsche Zollverein, sein System und seine Zukunft*, 1835.

[Von Weech in *Allg. Deutsche Biogr.*—Lippert in *Handb. der Staatswissenschaften.*—Roscher, *Gesch. der N.O.*, p. 953.] J. K. I.

NECESSARI HEREDES. Members of the household of a deceased person, upon whom his inheritance fell, succeeded to him as universal successors or heirs without any consent of their own, and whether they wished to succeed or not. Hence they are called in Roman law necessary heirs—*necessarii heredes*, being opposed to heirs, who are not members of the household of the deceased, as these do not acquire his inheritance without an act of acceptance on their part, *hereditatis aditio*.

There are two classes of *necessarii heredes*: 1. *sui et necessarii*, descendants of the deceased under his paternal power, who become by his death independent persons, *sui juris*; 2. *necessarii heredes*, i.e. slaves of the deceased made heirs by him in his will.

E. A. W.

NECKER, JACQUES (1732-1804), was born and died at Geneva. His character was an unusual mixture of qualities rarely united in one individual. A very able and honest banker, he established a house of the highest standing at Paris—Thélusson, Necker & Co.,—and rapidly accumulated a large fortune; satisfied with the wealth he had acquired, he retired from business at the age of forty to devote himself to politics and literature. He believed himself possessed of sufficient capacity to lead the political world, and that at a moment when it was in the utmost disorder. Dexterous in the use of expedients, and but slightly burdened with theory, he flattered himself that he would eclipse Turgot, whose inferior he was, especially in grasp of principle. His first work, the *Éloge de Colbert*, received a prize from the French Academy in 1773, he then wrote *De la législation et du commerce des grains*, 8vo, 1775, which, dogmatic in style and opposed to the views of

Turgot, had considerable success, and even contributed to the fall of that minister (19th May 1776). On Turgot's successor, de Clugny, dying, 30th October 1776, Taboureaux des Reaux was appointed to succeed him, and compelled to accept Necker as his coadjutor. This led to his resignation 1st July 1777, when his duties were handed over to Necker under the title of *Directeur-général des finances*. Though acting as *Contrôleur-général*, he was not granted that title, as this would have admitted him to the council of state, and he was a protestant. In this, his first essay in finance, Necker showed marked ability, diminishing the expenses, simplifying the machinery of the administration, and, through his connection with the great Bank, obtaining exceptionally favourable terms for the treasury. The tide of public opinion began now to set in the direction of the convocation of the *États Généraux*. In 1781 Necker's famous *Compte Rendu au Roi* appeared, addressed rather to the public than to the head of the state. His popularity increased; the success of his report, the first of its class, though incomplete, was great. The condition of the finances of the country was improved, but an unexpected result occurred. Cabals were roused against him, perhaps fomented by Necker's extraordinary vanity and his folly in mixing praises of his wife, whose *salon* was celebrated, with his official reports. The court became hostile, and in 1781 he was compelled to resign. But the weaknesses of the best-known of his successors, Calonne, caused the public to think with regret of the fallen minister, and the publication of *De l'administration des finances de la France*, 3 vols. 8vo, 1784, contributed to strengthen his popularity. This work, like those which Necker had written previously, is marked by an absence of general principle; it was declamatory and exaggerated in style, but valuable to those who would study how the finances of France were managed in the last days of the old régime.

Necker was detested by the court as a protestant and a bourgeois, nevertheless Louis XVI. found himself compelled to recall him to power, 20th August 1788, this time also with the title of *Directeur-général des finances*. The financial position was serious. The payment of the interest of the public debt was suspended, the treasury empty; Necker's return to power inspired confidence, and, as if by magic, money reappeared. He had, however, to employ his private resources to sustain the public credit. Though the court was still hostile, the multitude applauded him. When he spoke of retirement the court was compelled to ask him to remain in office, but by one of those sudden turns of fortune so frequent at this period, the king intimated to him his dismissal, 11th July 1789, and ordered him to leave France secretly. Necker obeyed and returned to Geneva. The

effect of his departure on public opinion was terrific. In the midst of these disturbances the Bastille was taken, and on 29th July, Necker was recalled by the court with the title of *Premier ministre des finances*, and was admitted to the council. His return was an unparalleled triumph. In every town that he passed through between Switzerland and Paris the horses were taken out of his carriage and he was drawn by the admiring people. This mad enthusiasm could not last. Some slight errors in judgment alienated public opinion, and on 8th September 1790 he was again compelled to leave office and France, this time for ever. The populace was indifferent, if not hostile. In a small town in Champagne, he, who had never deigned to accept the salary attached to his high office, was arrested as a malefactor. How little he had deserved this may be understood from the fact that he had left behind him at the treasury, to assist the public credit, £96,000, his own property, which was only returned to his daughter the well-known Madame de Staël-Holstein in the early years of the Restoration. An order had to be obtained from the national assembly to enable Necker to regain his liberty and to return to Switzerland.

Of Necker's later works we need only mention: *Sur l'administration de M. Necker par lui-même*, 8vo, 1791.—His work on *La législation et le commerce* is inserted in the economic collection of Guillaumin.

[Adam Smith called Necker "a mere man of detail,"—Sir J. Mackintosh is the authority for this. *Rae, Life of Adam Smith*, 1895, p. 206.]  
A. C. f.

NEGATIVE QUANTITIES occur in economies, as in other sciences, when a variable, passing through zero, becomes less than nothing, so that the addition thereof causes not augmentation but diminution. Most economic quantities are susceptible of this *change of sign*. Thus wealth, affected with the *minus* sign, becomes debt. The utility attending the consumption of wealth being taken as positive, the disutility of labour incurred by the production of wealth must be regarded as negative. Consumption is negative production. Jevons proposes to employ DISCOMMODITY to signify any substance or action which is the opposite of commodity, that is to say, *anything which we desire to get rid of*, like ashes or sewage (*Theory*, 2nd ed. p. 63). Such an article may be said to have negative value. Among articles which have a negative value AGENTS OF PRODUCTION may occur. The loss attending the use of old-fashioned machinery and plant may be considered as a negative "quasi-rent" (Marshall). It is conceivable that, capital becoming superabundant, borrowers would pay a "negative interest," that is, receive a payment for safeguarding and keeping up the capital borrowed (Prof. Foxwell, *The Social*

Aspect of Banking, *Journal of the Institute of Bankers*, vol. vii. p. 71, 1886). The practical limit to this class of payment would be soon attained. The payment which a waiter makes in order to be allowed to serve in a fashionable restaurant where there is a prospect of gratuities might be described as negative wages.

The geometrical representation of a negative quantity, by reversing the direction of a line, is common in mathematical economics. Thus Jevons (*Theory*, 2nd ed. p. 187) represents the disutility of labour by ordinates measured downwards, the utility of consumption being represented by ordinates measured upwards. Of course the pleasure which may attend initial stages of labour is to be measured in an opposite direction from fatigue. A beautiful example of this construction is given by GOSSEN.

[The philosophy of the subject is stated ably and authoritatively by Cournot in his *Revue Sommaire*, in a passage directed against Mr. H. D. Macleod's peculiar use of negative quantities in economics.]

F. Y. E.

**NEGOTIABLE INSTRUMENT.** The standard definition of a negotiable instrument is that given by Lord Blackburn, who says, "It may be laid down as a safe rule that where an instrument is by the custom of trade transferable, like cash, by delivery, and is also capable of being sued upon by the person holding it *pro tempore*, then it is entitled to the name of a 'negotiable instrument,' and the property in it passes to a *bona fide* transferee for value though the transfer may not have taken place in market overt." As regards the custom of trade, it is to be noted that the question must be determined by the usage of the English money market, and not by the usage of the country where the instrument was issued, if it be a foreign instrument. The definition itself appears to require two qualifications. First, an instrument, not otherwise negotiable, may be made negotiable by statute; and, secondly, foreign government bonds to bearer may undoubtedly be negotiable, yet the holder cannot sue the foreign government upon them in the courts of this country. The main classes of negotiable instruments are, bills, promissory notes, cheques, bank-notes, exchequer bills, foreign bearer bonds, bearer debentures, and scrip. Postal orders are not negotiable.

[See **COMMERCIAL INSTRUMENT**; **NOT NEGOTIABLE**; Chalmers on *Bills of Exchange*.] M. D. C.

**NERI, POMPEO (1707-1777).** Born in Florence, a Tuscan economist and statesman. He was a minister of Leopold I. of Tuscany. He also held office in Milan under Maria Theresa and reformed the municipal government there. He presided at the commission of the taxation of the state of Milan, and at the conferences appointed to draw up a coinage convention between the Austrian states in Italy and the states of the king of Sardinia on the Italian

side of the Alps. Neri's name is especially associated with the great Leopoldine reforms in which he played an important part; he was entrusted with the compilation of the civil laws for Tuscany; he then undertook economic reforms, suggesting to his sovereign the adoption of free trade in grain, which he was the first in Italy to support, and introduced gradually by the laws of 1763-64 and the edict of 1767—the corner-stone of the edifice of economic freedom in Tuscany. He abolished the duty on foreign corn, taxes and bounties on bread, and overcame the obstacles which hindered the free circulation of cereals in the interior.

Neri's work is of importance from a scientific point of view. In his *Discorso sulla materia frumentaria* he shows that absolute freedom for the corn trade is the only system suitable to Tuscany, and is the fundamental basis of its economic laws, whether agriculture or the general requirements of food production be considered. This treatise formed the basis of those Tuscan reforms on which an illustrious group of economists collaborated. Another important work of Neri's is on the value of money, in which, though he may not state much that is new, he expounds with brevity and clearness the principles regulating the choice of the material for the coins, and defines the regulations according to which money should be minted. He also wrote in 1750 a voluminous report on the basis of the Milanese taxation, a great work of proportionate assessment initiated by Charles VI. in 1718, and carried on by Neri. This report was continued by G. R. Carli in 1776. *Osservazioni sul prezzo legale delle monete*, Milan, 1751.—*Discorso sopra la materia frumentaria*, 1767.—*Relazione dello stato in cui si trova l'opera del censimento universale del ducato di Milano*, 1750.—See, concerning Pompeo Neri, J. Montgomery Stuart, "The History of Free Trade in Tuscany," in the *Cobden Club Essays*.—V. Cusumano, *La teoria del commercio dei grani in Italia*, Bologna, 1877 (Archivio Giuridico).—A. Morena, *Le riforme e le dottrine economiche in Toscana*, Florence, 1886-87 (in the *Rassegna Nazionale*).

U. R.

**NEUMANN SPALLART, FRANZ XAVIER (1837-88).** Ritter von Neumann Spallart was an Austrian economist and statistician of high ability whose comparatively early death at about fifty years of age was regretted by friends and colleagues not only in Austria but in all the leading countries of Europe. He was educated at the university of Vienna, where he studied law and economics, and took his degree as doctor of laws in 1862. After travelling for a time in Europe, he returned to Vienna. In 1864 he became professor of political economy at the Vienna commercial academy, and subsequently was appointed to other important educational positions. In 1871 he became an honorary member of the Imperial-Royal Statistical Central Commission, to which body he gave valuable services up to the time of his death. In 1876 he represented the

commission at the International Statistical Congress at Buda-Pesth, at Paris in 1878, in Paris again in 1885, and in London with Professor von Inama Sternegg in the same year, when the jubilee of the Royal Statistical Society took place. This meeting in London was remarkable for the foundation of the International Statistical Institute, the regulations of which Neumann Spallart drafted chiefly in concert with Dr. L. Bodio, though others had a share in that important work. The institute, at its first meeting in Rome in 1887, elected Neumann Spallart as its second vice-president; and though far from well at the time, he did much useful work on that occasion. In the winter of 1887-88, the chest complaint from which he had always suffered more or less grew rapidly worse and he died in April 1888.

Neumann Spallart was the author of a great many volumes and pamphlets, many of them having special relation to Austria-Hungary, as might be expected. A list of his works will be found in the *Journal of the Statistical Society* for June 1888. His most widely-known contribution to statistics is his admirable *Uebersichten der Volkswirtschaft* published at Stuttgart in various years from 1870 to 1883-84.

W. H.

**NEUTRAL MARKETS.** It is one of the main objects of neutral states to keep their markets open for trade in time of war. On the other hand belligerent powers, in their anxiety to deal effective blows at their adversaries, are apt to strike at them through neutral commerce. Since the transactions of neutral markets take place on neutral territory, they cannot be directly interfered with by the states at war. But indirectly they can be injured by interference on the high seas with vessels which carry goods to and from their ports. Practice has varied from time to time, and sometimes an exceptional usage has been adopted for a while by powerful belligerents (see **INTERNATIONAL LAW**). Thus the right of confiscating not only enemy goods found on board a neutral ship, but the ship as well, was claimed and exercised by France and Spain at the beginning of the last century. A hundred years later England and France enforced their violent and illegal measures of mutual retaliation at the expense of neutral trade, and to the ruin of neutral markets (see **CONTINENTAL SYSTEM**; **LICENSES (Continental War)**). But commercial interests are now far too powerful to be harried with impunity. By the Declaration of Paris of 1856 both enemy goods laden on neutral ships and neutral goods laden on enemy ships are allowed to pass freely to and from neutral ports (see **DECLARATION OF PARIS**). Leaving out blockade which is *sui generis*, the only exceptions to the rule of freedom are found in the cases of enemy ships, enemy goods on enemy ships, and contraband of war carried in neutral ships. The two former would dis-

appear if private property at sea were exempted from warlike capture. The latter will probably remain as long as wars continue; for no power is likely to deprive itself of the right to seize munitions of war on the way to an enemy. During the American civil war of 1861-1865, each side bought enormous quantities of arms and ammunition in England; and the neutral British port of Nassau in the Bahamas became the centre of a considerable trade in goods intended to run the blockade of the ports of the Southern Confederacy. In the war of 1904-5 between Russia and Japan the former power purchased all sorts of weapons and warlike stores in Germany, from where they were conveyed to her across her land frontiers. The law of contraband is powerless to deal with a trade of this kind which does not cross the seas and cannot be intercepted by the other belligerent.

[The references given at the end of the articles cited in the text will apply to the present subject. For the sudden rise of Nassau, and the trade in contraband of war between England and America, see the British and American *Cases* presented to the arbitrators at Geneva in 1872, and M. Bernard's *Historical Account of the Neutrality of Great Britain during the American Civil War*.] T. J. L.

**NEUTRAL PROPERTY** may be described as the property of neutral states, subjects of neutral states, or enemy subjects domiciled in neutral states. But if a neutral subject is domiciled in an enemy's country, his property connected with the enemy domicile is regarded as enemy property for purposes of belligerent capture, as also is property at sea owned by neutrals, not incorporated in enemy commerce or subject to enemy control. Moreover, if an enemy subject is domiciled in a neutral state, only his property connected with the neutral domicile ranks as neutral property. Neutral property in neutral territory is inviolable; but if the land forces of one belligerent occupy a district belonging to the other, they may subject neutral property found therein to all the severities of warfare. At sea neutral vessels, if public, are free from belligerent search, but, if private, must submit to it. They may be subjected to capture and condemnation for an attempt to run a lawful blockade or perform an unneutral service. The usual penalty for carrying contraband of war is confiscation of the cargo only; but in aggravated cases the vessel also is condemned. Neutral goods are not liable to confiscation unless they are laden on board an armed enemy vessel, or connected with a breach of blockade, or contraband in their character. On an ordinary merchantman engaged in ordinary traffic they are safe, even under the enemy's flag (see **DECLARATION OF PARIS** and the sections on *War and Neutrality* in **INTERNATIONAL LAW**).

See Hall, *International Law*, pt. iv. T. J. L.

**NEUTRALITY.** See **INTERNATIONAL LAW**.

NEVES, JOSE ACCURSIO DAS (1766-1834), a Portuguese economist.

He wrote *Variedades sobre objectos relativos as artes, commercio y manufacturas* (Lisbon, 1814 ff. 2 vols.). He was a protectionist in his opinions, and possessed a very thorough knowledge of the economic history of Portugal.

[Cossa, *Introduction to Pol. Econ.*, English trans., London, 1893.]

NEW CUSTOMS. The title given to the additional duties on certain goods imported by Edward I. in 1302, in distinction to the duties termed "Ancient Customs — antiqua custuma" (see CUSTOM, CUSTOMS DUTIES).

[Dowell, *History of Taxation*, 2nd ed., vol. ii. p. 79 ff.]

NEW IMPOST. The name under which the EXCISE (*q.v.*) was known when that system of taxation was first introduced in 1643. At first "the prime necessities of life, flesh and salt," were included, and the tax was, and long continued to be, very unpopular.

[Dowell, *History of Taxation*, 2nd ed., vol. ii. p. 9 ff.]

NEW SUBSIDY. The original import duties in England (see IMPORT DUTIES) were called the "subsidy" of tonnage and poundage. The subsidy of poundage was from 1373 onwards for a long time fixed at a shilling in the pound or 5 per cent *ad valorem*; so that in the language of the customs, subsidy came to mean a general import duty of 5 per cent *ad valorem*. The "new subsidy" was the duty at that rate imposed by 9 & 10 Will. III. c. 23 (1697) and appropriated to the civil list. It was long kept separate in the accounts of the exchequer.

[Hall's *History of the Customs Duties.*]

C. A. H.

NEWBURY, JACK OF, a hero of 17th century chap-books, around whose name gathered a multitude of absurd and mythical stories, was in fact a certain John Winchcombe, a wealthy clothier, who carried on business at Newbury early in the 16th century. "Winchcombe's kersies" were well known in the reign of Edward VI.; and his descendants afterwards made their way into the ranks of the county gentry. It is probable that, anticipating the later factory system, he made an attempt to gather a large number of workpeople under the same roof; but all such experiments must have been put an end to by the act of 1553 limiting the number of looms any clothier might possess.

[Ashley, *Econ. Hist.*, vol. i. pt. ii. pp. 229, 236.]

W. J. A.

NEWENHAM, THOMAS (1762-1831), was member of Irish parliament of 1798, and strenuously opposed the union. After its enactment, he settled in England and endeavoured by his writings to spread a better knowledge of Irish affairs amongst English readers. His works include *A Statistical and Historical*

*Inquiry into the Progress and Magnitude of Population of Ireland*, London, 1805, 8vo, wherein, while holding that the population of Ireland tended to double itself in every forty-six years, and that its then population was nearly 5,400,000, he maintained that Ireland was capable of supporting in comfort a far greater population than this.—*A View of the Natural, Political, and Commercial Circumstances of Ireland*, London, 1809, 4to: this work is divided into four parts, the first dealing with the natural advantages which qualify Ireland for the acquisition of commercial wealth, and the latter three in a somewhat confused manner with the causes which frustrated these. These books were reviewed by MALTHUS (*q.v.*), *Edinburgh Review*, July 1808 and April 1809, vols. xii.-xiv. His last publication, *A Series of Suggestions Relative to Ireland*, Gloucester, 1825, 8vo, contained the substance of the evidence he would have given before a House of Commons committee on Ireland had his health allowed him. In this he advocated the establishment in Ireland of banking companies, and strongly opposed the introduction of a poor law (see NICHOLLS, Sir G.), and any system of state-aided emigration.

[*Dictionary of National Biography*, vol. xl.]

H. E. E.

NEWMARCH, WILLIAM (1820-1882). This eminent economist and statistician was a native of Thirsk, Yorkshire. He had but few of the advantages that a middle-class education now affords, and was mainly indebted for his general training to habits of self-culture, and to his association at an early period of life with men engaged in active business pursuits. His earliest bringing-up was as clerk to a distributor of stamps in his native county, then he moved into the service of the Yorkshire Fire and Life Office at York, and afterwards into the banking-house of Messrs. Leatham, Tew, and Co. of Wakefield. Marrying young, and anxious for a wider scope for the exercise of a talent for economical subjects, Newmarch removed to London. There he obtained constant employment on the staff of the *Morning Chronicle* newspaper, and became at the same time second officer of the Agra Bank established in London in 1840. His knowledge of the principles of banking and of general business gained him the influential support of leading men in the city, particularly of William Tooke, whose close disciple he became in all that relates to economic science and banking. Newmarch, in 1851 resigned his position at the Agra Bank to become secretary of the Globe Insurance Company. Tooke was desirous of continuing his book on the *History of Prices and of the state of the Circulation from 1792*, and upon Newmarch's offering to co-operate with him in writing two additional volumes, the offer was gladly accepted, in the same spirit as Mr.

Danson's offer of assistance had previously been welcomed in the case of the fourth volume, published in 1848. The fifth and sixth volumes in their turn demanded some years of careful study. A vast body of statistics had to be methodised on novel and original principles of treatment. At length, in 1857, the public obtained the advantage of these researches, and they were accepted with approval, both at home and abroad. In Germany, especially, the two volumes were thought worthy of translation and of use in several universities. In 1857, Newmarch gave evidence before the select committee of the House of Commons on the Bank Acts. Like Tooke, he was opposed to the fixing of legislative limits to the issues of the Bank of England, or to the setting aside of a fixed amount of bullion as a guarantee for the circulation. In place of this he advanced the plea that legal convertibility would adequately secure against over-issue. He also advocated a discontinuance of the separation of the issue and banking departments of the Bank of England.

Newmarch had long been associated with the Royal Statistical Society of London as one of its honorary secretaries, he took the utmost interest in its meetings, and in 1869-1871 became its president in succession to Mr. Gladstone. He was also for many years secretary of the Political Economy Club, and was elected a fellow of the Royal Society and a corresponding member of the academy of moral sciences of the Institute of France. In 1862 he quitted the service of the Globe Insurance Company and became the chief officer in the banking-house of Glyn, Mills, and Co., where he remained until shortly before his death in 1882.

Newmarch for more than thirty years contributed some of his best work to the public press, as mentioned previously, to the *Morning Chronicle*, where, in 1853, a series of his papers appeared on the new supplies of gold. Reprinted in London, in 1853, in a volume of 122 pages 8vo, with five additional chapters, they attracted a great deal of public attention, as containing by far the most valuable review attainable on the Californian and Australian gold discoveries, with facts and statements relative to their actual amount, and their present and probable effects.

In 1855 he published an essay *On the Loans raised by Mr. Pitt during the first French War, 1793-1801, with some Statements in Defence of the Methods of Funding employed*. The case was supported by elaborate calculations respecting each loan, supplied by Mr. Frederick Hendriks, and the main contention of the essay was that W. PITT, in his plans of borrowing, did the best that could possibly have been done for England under the circumstances of the times. The arguments were controverted

in a published series of lectures to the university of Oxford by Professor Rickards, but were warmly defended by Earl Stanhope in his biography of Pitt.

In 1861 Newmarch was president of the economic section of the British Association at the meeting in Manchester, and in his address he submitted that full as the thirty years then past had been of scientific achievements, those of economic science and statistical inquiry had a place in the first rank, and had arrived at an intermediate point, at which, after long debate, many of the earlier controversies are finally settled, and from which the way can be seen to a higher level, the least doubtful result of our experience being the discovery that the most solid progress is made by guiding ourselves in the main by close observation of facts, and by employing speculative and hypothetical reasoning under the most cautious conditions, and always with distrust and reserve.

Amongst the most important of Newmarch's contributions to the periodical press, journals weekly and daily, and reviews and magazines, which, although anonymous, did no little in furnishing the public with sound views on banking, free trade, and currency, and on business principles generally, may be mentioned his annual "Commercial History of the Year" in the *Economist*; this was commenced in 1863 and continued down to 1882. Besides this annual contribution of facts and figures on which a superstructure of able reasoning was raised, Newmarch had long been a valued contributor to the *Economist* during the editorships of Mr. Wilson, Mr. Bagehot, and Mr. Inglis Palgrave, and the suggestion came appropriately from the pages of that journal (during the editorship of Mr. Palgrave), that if his surviving friends desired to promote some public memorial of him, no better form of it could be devised than the foundation of a professorship under his name of economic science and statistics. In the result, a subscription was made by them with this object, and the sum of about £1500 contributed for the endowment of the Newmarch lectures at University College, London.

F. H.

NEWTON, SIR ISAAC (1642-1727). For particulars in regard to Newton's scientific, theological, and other work, reference must be made to the various biographical notices indicated below; it is here only proposed to deal briefly with his work in connection with the Mint and currency questions.

Newton's long association with the Mint arose primarily from the fact that his old college friend, Charles Montague, was Chancellor of the Exchequer in 1695, when the state of the currency was causing very grave anxiety through the prevalent practice of clipping and the impossibility of preventing

the good coins issued by the Mint from being immediately withdrawn from circulation and either melted or exported. The confusion which existed at that time is eloquently described in chap. xxi. of Macaulay's *History*, and some account is also there given of the steps taken to remedy the evil. Montague and Somers, the Lord Keeper, were associated with Newton and Locke in this great work, Newton being appointed Warden of the Mint by royal warrant dated the 13th April 1696, in succession to Benjamin Overton who had been made a Commissioner of Customs. On the death of the Master and Worker, Thomas Neale, Newton was promoted to that office by warrant dated the 3rd February 1700, the appointment dating from Christmas day, 1699. He retained this post until his death in 1727. The warrants confirming his appointment at the beginning of the reign of Anne and of George I. bear the dates 11th June 1702 and 1st January 1714 respectively.

It is hardly necessary to state that in Newton's day the Mint was located in the Tower of London, where it occupied the entire space between the outer rampart and the inner ward or ballium. As Master he was provided with an official residence situated immediately to the left on entering the Byward Tower, but to what extent he occupied it is not positively known. An interesting plan of the Mint buildings, prepared in 1700, is still preserved in the Royal Mint on Tower Hill.

In view of the fact that the last thirty-two years of his life were thus spent in superintending the currency of the country, it is remarkable that so little information of an important character has been published in regard to this portion of the great philosopher's work. Beyond the text of the several warrants referred to above, and occasional references to his attendance at board meetings, reports, etc., the Mint records are silent as to his doings, and even the voluminous life by Brewster, extending to upwards of a thousand octavo pages, dismisses the subject with a few pages, in chap. xix., and these deal with petty administrative difficulties rather than with larger questions such as that which led to his appointment in the first instance. On such questions Newton's opinion seems always to have been acted upon, and his classical Reports of 1702 and 1717, on the relative values of gold and silver and the rating of the GUINEA (*q.v.*), prepared at the instance of the Lord High Treasurer, have frequently been reprinted. The records of the Treasury, however, are rich in evidences of his wide knowledge of matters directly or indirectly relating to currency, and between the 2nd May 1696, the date of "Dr. Newton's oath as Warden of ye Mint," and the 10th November 1725, when he reported on "Portugal coins," the allusions to him in

the *Calendar of Treasury Papers* are very numerous, numbering ninety-eight in all. It is impossible within the limits of a short article to discuss the many important matters dealt with in these papers, but a few may be mentioned in order to show at once their importance and their variety. Cases of clipping and counterfeiting are very numerous; he was called on to deal with many memorials, including one in 1697-98 from the well-known engraver Roettier, who supplanted Simon in the reign of Charles II., and, in 1722, to act as Comptroller of Wood's copper coinage for Ireland, rendered so famous by the abuse of Dean Swift, as well as of a similar coinage for the West Indies. Such questions as the water-marking of paper, melting of silver bullion with "pit-coal," and the artificial raising of the price of tin, were submitted to him for report, and it is interesting to note that in most cases the reports which have been preserved, many of considerable length, are entirely in the handwriting of Newton.

It will be convenient to enumerate here for reference his principal reports on currency questions, with their dates.—28th Sept. 1701. Memorial to the Treasury as to the influence of recent changes in the French currency on the relative values of gold and silver coins in England.—7th July 1702. Report to the Lord High Treasurer on the value of foreign gold and silver coins, and on the supply of silver coins in this kingdom.—21st Aug. 1711. Report on a Spanish two Ryall piece.—7th Oct. 1712. On the rating of French money for the use of Her Majesty's forces at Dunkirk, and on the exchange with France and Holland.—21st Sept. 1717. On the state of the gold and silver coins of the kingdom, and on the relative value of gold and silver.—12th April 1720. Report "On the value of Imperial dollars both intrinsically and by way of exchange with Sweden."—10th Nov. 1725. Report on five Portuguese gold coins varying in value from 4s. 4d. to £3:11:6½.

In regard to the views held by Newton on the general principles of currency, the claim sometimes advanced that he should rank as a bimetalist must not be overlooked. Jevons showed at some length, in an unfinished paper mentioned below, that this view is erroneous. He there states explicitly that Newton's "scheme is not bimetalism," and he adds, quoting from Cantillon, that in reducing the rating of the guinea to twenty-one shillings, "Newton" did not intend to determine between gold and silver moneys a strict proportion as to price, "that is a proportion corresponding with their market price." The currency troubles of Newton's day, complicated though they were, arose mainly from variations in the values of gold coins when measured in silver, the standard of the country, and it would be difficult to imagine more convincing evidence of his far-seeing judgment than the simple fact of our sovereign of to-day being the direct outcome of Newton's valuation of the guinea in 1717.

E. R.

NICÉRON, JEAN PIERRE (1685-1738), was a French Barnabite monk.

He compiled 44 vols. of *Mémoires pour servir à l'histoire des hommes illustres de la République des Lettres avec un catalogue raisonné de leurs ouvrages*, 1722-1745, full of copious and valuable bibliographical information extending to writers who have no claim to the title of illustrious. These *Mémoires* were translated into German a few years after Nicéron's death.

[Guérard, *La France littéraire au 18<sup>me</sup> siècle*; and Didot's *Nouvelle Biographie Générale*, 1858.]

E. ca.

NICHOLLS, CHEVALIER JOHN, pseudonym of Plumart de Dangeul (see DANGEUL, MARQUIS DE).

Born in the beginning of the 18th century, master of audits in France, published under this fictitious name his *Remarques sur les Avantages et les Désavantages de la France et de la Grande Bretagne par rapport au Commerce*, Amsterdam (Paris), 1754, supposed to be a translation from the English. He also published a real translation of Ulloa: *Le rétablissement des manufactures et du Commerce d'Espagne*, Amsterdam, 1755.

E. ca.

NICHOLLS, SIR GEORGE (1782-1865), public servant, entered the maritime employ of the East India Company, at the age of fifteen. After retiring from that service (1815), he settled in 1819 at Southwell, Notts. His attention had been first drawn to the subject of the poor law by reading the Report of the House of Commons committee of 1817. In 1821 he became overseer of the poor for the parish of Southwell, and forthwith set on foot most valuable reforms in administration. The importance of this work is not to be gauged by the extent of the area over which it operated, but by the fact that the Southwell workhouse, together with that of Bingham, was the model on which the whole workhouse system of the new Poor Law was based. Nicholls was for the most part absent from Southwell after 1823, and left it altogether in 1827, but his work survived, and he relates, with pardonable pride, how, on the occasion of a subsequent visit, he was cordially greeted by a group of labourers, who told him that he had been their best friend, because he had made them help themselves. It was therefore peculiarly fitting that, on the passing of the Poor Law Amendment Act, Nicholls should have been—in August 1834—selected as one of the three new commissioners.

He was, at the time, the manager of the Birmingham branch of the British Bank of England, and, so great was their sense of his value, that he was offered an additional £500 per annum if he would remain in the bank's service. Although the broad lines of poor-law policy were settled by the act of 1834, the change to be effected was so great that it was necessary to leave much, with regard to the time and mode of enforcing that policy, to the discretion of the commissioners. The formation of unions, the provision of workhouses, and the issuing of orders for the guidance and government of boards of guardians, were matters requiring the exercise of the utmost tact as well as ability. In 1836 Nicholls visited Ireland, with the view of reporting on the expediency of introducing an Irish poor law. The act, as finally passed in 1838, followed mainly the lines of his report. From 1838 to 1842 Nicholls remained in Ireland, to supervise the introduction of the new law. Important as had been the work of the poor-law commissioners, it was generally recognised that their strength would be increased by coming more closely into touch with parliament. The powers of the board were therefore, in 1847—10 & 11 Vict. c. 109—transferred to commissioners forming part of the government of the day, the services of Nicholls being retained as secretary to the new board. In 1851 he retired, and was made a K.C.B. The loss to the country of his services was given ample expression to in the House of Lords, where Lord Fortescue, who had seen much of him in Ireland, eulogised his great abilities, "persevering industry," and "great self-devotion to the public service," and Lord Brougham, who had conducted the Poor Law Amendment Act through the House of Lords, expressly affirmed that he "was the great and principal agent in devising the new law, and in carrying it afterwards into execution." The first years of his leisure Nicholls devoted to writing the history of the law, in the administration of which he had borne a leading part. When he died he was an old man, and had become, as so often happens, to some extent forgotten. At the present time, however, we are better able to value his services. If, between the advent of democracy in England and its final triumph in our villages, there has been a breathing space of sixty years, wherein the steady and continuous, though incomplete, depauperisation of the labouring classes has gone on, under the operations of a law often ahead of the public opinion of the day, it is to Nicholls more perhaps than to any one man that the result is due.

Nicholls' writings include: *Eight Letters on the Management of our Poor and the General Administration of the Poor Laws*, by an overseer, 1822 (reprinted from the *Nottingham Journal*).

NICOLAI (18th-19th century) undertook historical research on laws respecting food supply and finance in the papal states. In one of his most important reports, Nicolai discusses the organisation of the land tax, arranged by Pius VII., for all parts of the kingdom, bringing together the threads of economic and financial tradition in the papal states. Nicolai studies the different methods of taxation, reform in which was felt necessary by the government, and gives the preference to the land tax in agricultural districts, together with some indirect taxes on consumption to equalise the incidence as far as possible. He agrees substantially with the classical doctrine prevalent at the time, which regarded the land tax, established on the system of the CATASTO (*q.v.*), as the pivot of fiscal organisation. Nicolai's other treatises contain remarks on the supply of food.

NIFO, AGOSTINO (1473-1538), was born in Sessa (southern Italy) of a noble family. From 1492 to 1498 he taught philosophy at the university of Padua, then at Salerno and Naples. Many honours were bestowed on him by Leo X., and he was highly esteemed as a philosopher.

In his moral and political pamphlets he discusses economic subjects, and is a faithful follower of ARISTOTLE. Like other writers of his day, Nifo forms a moral rather than an economic conception of wealth. Riches, in his view, are not to be desired for themselves, but only as means to higher ends; thus wealth, taken as the foundation of prosperity in a state, can only be considered the means or instrument of its prosperity.

In the distinction of the different kinds of riches, and in the difference between riches and

money, Nifo always follows ARISTOTLE, whilst on other points he adopts the ideas of St. Thomas AQUINAS. He makes a strong distinction between the aims of economic and administrative science and the importance to be assigned to the action of the state in increasing public wealth.

NIHILISM (RUSSIAN) is a term connoting various forms of social dissatisfaction, political and economic, mainly among the better-educated classes of Russia. As the name implies, its aim is the annihilation of existing social institutions, and in this respect it forms part of the negative movement of the present day, against all forms of traditional authority, and, so far, it coincides with ANARCHISM. In Russia, however, it is not capital and the *bourgeoisie* that are the object of attack, but government as such. Nihilism arises out of local causes—political, economic, and racial,—and is the outcome of two opposite tendencies of the Slave mind—absolute idealism and cynical realism,—which in combination produce impatient destructiveness and revolutionary passion. The former is represented by Herzen, the latter by BAKOUNIN. Philosophically, the early promoters of nihilism belonged to the Hegelian school (see HEGEL), in which they saw, like K. MARX and his followers, the basis for their own theories of social revolution. Nihilism also owes some of its ideas to the pessimistic scepticism imported with modern French literature, which easily assimilates with the indigenous tendency towards melancholy mysticism. These two act as dissolvents. The passionate cultivation of Physical Science by the fast-growing "literary proletariat" has much encouraged this tendency. The disciples of the materialists, Büchner and Moleschott, are ardent advocates of a complete demolition of the present social system. Politically, nihilism is a reaction against repression by despotic government and an oppressive and corrupt system of BUREAUCRACY; it is liberalism and constitutionalism in some of its aspects, but reforms initiated by "imperial nihilists," such as the liberation of the serfs, have encouraged the movement. To some extent, too, it is encouraged by pan-Slavism as a popular agitation in favour of a "federal united republic of all Slavonic tribes." Even the ancient institution of the MIR, as a relic of agrarian communism, serves as such as a type of democratic self-government, and suggests the extension of its method as the "rural commune" to the whole edifice of society. And, lastly, some of the boldest agents of nihilism are to be found among the Jewish youth, whose zeal has been enlisted in the cause as means of avenging the wrongs

done to their race by the official class. Having stated the causes of the movement, we may now proceed to follow its course. Nihilism proper begins in 1858, following immediately upon the military collapse of the empire, though the secret machinations of radicalism go back to 1846-49. The nihilistic creed, suggested in principle by PROUDHON, was not formulated till 1867, though a sanguinary manifestation of "the central revolutionary committee" appeared in 1862. The growth of socialism in Germany and France from 1863 to 1871 promoted Russian nihilism so much that in the years 1873-76 it displayed great activity, especially in publishing and disseminating periodicals, pamphlets, and appeals in various forms. Then, too, began the rage on the part of the aristocratic youth to "go among the people," living and working among them in disguise, thus to become "simplified" with a view to indoctrinate the operative population with nihilistic ideas. The result was that in 1873, some 156 of them came into collision with the police, whilst 3800 were more or less complicated in the "monster-process (trial) of 193" in 1874-75. Having suffered a slight relapse in 1876-77, in consequence of the Russia-Turkish war, nihilism revived in 1878, when Vera Sassoulitzsch attempted to assassinate General Trepoff, and thence began the duel between the nihilists and the authorities which led to the death of the Czar, Alexander II. (1855-1881), who was "condemned" by the "executive committee" in August 1879. In that year it is computed there were at least 20,000 suspects, the journal *Will of the People* being the organ of the secret conspiracy. Under the reign of the late Czar, Alexander III. (1881-1894), which has been termed the "social empire," and since, nihilism has not appeared much on the surface, but the political trial of five nihilists in 1890, as well as the methods adopted to protect the life of the czar against secret attack, show that the terror was by no means over.

The actual demands of nihilism, as far as they are put into distinct form, are, on the part of the moderate section, amnesty of political offenders, the abolition of the secret police, inviolability of the home, freedom of the press, of speech and meeting, religious equality, the autonomy of towns, communes, and provinces, and the control of public functionaries by county councils, the appointment of imperial commissions of inquiry into the economic condition of the people, and that of a ministry for the encouragement of industry, agriculture, and co-operative associations, with a view to develop the resources of the country. The demands of the new advanced section are, the abolition of monarchy, state-religions, and landed proprietorship; and a free soil for the sustenance of the whole population; and the discontinuance of a standing

army and governmental administration; meanwhile the sentence of death is pronounced on all public functionaries hostile to these designs. A proclamation of the executive committee drawn up shortly after the attack on the emperor, Alexander III., sums up the demands of the terrorists as follows:—A representative democratic form of government; permanent parliaments, with full powers to regulate matters of state; extension of local government in the provinces; autonomy of rural communes; the land to be put into the possession of the people; means to be found for placing the factories into the hands of the ARTËL, or artisan gild; transformation of the army into a militia; liberty of the press and industrial combination.

From this it will be seen that, in its economic bearings, nihilism resembles in many respects the more violent forms of socialism; though one of its most distinguished representatives, Prince Krapotkin, deprecates the collectivist programme, since he objects to authoritative communism, but demands a "free communism" which should secure "economic freedom." Thus the essence of nihilism is "absolute liberty," as Herzen said in 1849, "freedom from all received opinions and traditional hindrances and difficulties, the historical block which prevents the advance of intelligence and stops the way of western progress." The block is the impediment of historical continuity, but the application of this destructive principle of extreme nihilism, which is identical with the extreme form of individualism, would render the historical development of society impossible, it would put an end to society itself.

M. K.

NITZSCH, KARL WILHELM (1818-1880), became in 1848 extraordinary professor of history at Kiel, in 1858 ordinary professor there, in 1862 professor at Königsberg, and in 1872 at Berlin. He was the author of several works on Roman and mediæval history, chiefly in their constitutional and economic aspects; and by these, as well as by his personal influence as a teacher, he gave a powerful stimulus to the study of economic history in Germany.

His most noteworthy works are those which give the results of his own minute investigations into German town life in the 11th, 12th, and 13th centuries. These are *Ministerialität und Bürgerthum im 11. u. 12. Jahrh.* (1859), published as the first volume of *Vorarbeiten zur Geschichte der Staufischen Periode* which was never completed; and then after a long interval the two articles *Ueber die niederdeutschen Genossenschaften des xii. u. xiii. Jahrh.*, and *Die niederdeutsche Kaufgilde*, printed in the *Monatsb. d. Berl. Akad. d. W.* for 1879 and 1880 respectively. A number of other papers of lesser importance are collected in *Deutsche Studien* (1873). In the *Geschichte des deutschen Volkes, bis zum Augsburger Religionsfrieden*, put together by his pupil G. Matthæ after Nitzsch's death, from his lecture notes and other papers (1882-83; 2nd ed. 1891-92), will be found a sketch, drawn in bold and masterly outline, of the whole development of German society and institutions. He was one of the earliest, if not the earliest, of the professional historians to make the economic element the dominating one in the story of national life. Some account and a criticism of his German history and of his views on mediæval social development are given in the *Econ. Journal*, iii. 686-690.

W. J. A.

NOBLE, a gold coin first issued in 1344, half and quarter nobles being issued at the same time. The following table shows the variations of the coin in different years:

Year.	Value.	Weight.	No. coined from Tower pound.	Fineness.
1344	s. d. grains. 6 8 138 $\frac{1}{2}$		39 $\frac{1}{2}$	carats 23 grains $\frac{1}{2}$ ; alloy $\frac{1}{2}$ gr.
1346	...	128 $\frac{1}{2}$	42	...
1351	...	120	45	...
1414	...	108	50	...
1422	...	...	...	...
1460	8 4	...	...	...
1465	10 0	120	45	...
1527	6 8	71 $\frac{1}{2}$	...	...

An issue was ordered in 1470-71, but no specimens of it are known, and it was probably not

executed. The coins of 1465 were also known as "royals" or "ryals," those of 1527 as "George nobles"; in the latter year there seems to have been also an issue of nobles worth 11s. 3d. These coins gave way finally to sovereigns and half sovereigns.

Note.—The Tower pound, which was abolished by Henry VIII., was  $\frac{3}{4}$  oz. lighter than the lb. troy.

[Ruding, *Annals of the Coinage of Great Britain*, 1840.—Kenyon, *Gold Coins*. Where there is a difference in the dates the table follows Ruding.]

E. G. P.

NOBLE OF RAYMOND LULLY. There was a tradition as late as Camden's time that the first English nobles, coined in 1344, were produced by alchemy in the Tower of London by Raymond Lully, the famous mediæval "philosopher"; the inscription borne by the coins,—*Jesus autem transiens per medium eorum ibat*—in reality a charm, was supposed to be mystical. But Lully died many years before this coinage, probably in 1315, and hence could not have assisted in it. In his lifetime he was supposed to have practised the art of transmuting baser metals into gold.

[Camden's *Remains*, art. "Money."—Tyrwhitt's *Chaucer*, vol. iv. p. 183.—Ruding's *Annals of the Coinage of Great Britain*, 1840, p. 220.]

NOMINAL VALUE. See VALUE.

NORMAL VALUE. See VALUE.

NORMAN, G. WARDE (1793-1882), a clear-headed writer on social, political, and economic questions of his day. In 1833 (reprinted in 1838) he published *Remarks on some Prevalent Errors with respect to Currency and Banking: and suggestions to the Legislature as to the Renewal of the Bank Charter*. The subject was treated under four distinct heads, as follows:

1. The principles on which a paper circulation should be regulated.
2. Examination of suggested remedies for the evils of the present system.
3. Remarks on the late and previous periods of commercial suffering connected with derangement of the currency in this and other countries.
4. The writer's view of the best course to be pursued in the actual state of affairs.

In 1841, *Letter to Sir C. Wood, Bart., on Money and the means of economizing the use of it*. This was published after the sitting of the Committee of the House of Commons, of which Sir C. Wood was Chairman, to enquire into the working of the Bank Charter Act, and at which Norman was examined at length.

In 1849 *An Examination of some Prevailing Opinions as to the Pressure of Taxation in this and other Countries* (4th ed. 1864), in which he established the following propositions:

1. That the financial burdens of England did not seriously press on her resources, and that,

when compared with her augmented wealth, their pressure had been greatly diminished since 1815.

2. That the pressure of these burdens, when compared with the means of bearing them, were heavier in other great European states than in England.

3. That on the whole a spirit of frugality is more apparent and influential in the English Government than in those with which it is usually brought into favourable comparison.

In 1860, *Remarks on the Incidence of Import Duties*. This was written fifteen years earlier, and was a reply to publications by Col. Torrens, called *The Budget* and a *Letter to Sir R. Peel*.

In 1869 *Papers on Various Subjects* (London, 1869, 8vo). This consists of reprints of papers published at various times and on various subjects, many being articles in newspapers—many very interesting, treating, amongst other things, of protection, the laws of partnership, the poor laws, the national defences, the new reform bill, the export of silver to India, the money market, the housing of labourers, the land question, and democratic government.

On almost all these questions he took a peculiarly advanced, and almost modern, standpoint. He pointed out the fallacies of protection and the mercantile system.

A. L.

NORMANTE Y CARCAVIELLA, DOCTOR LORENZO (second half of 18th century), was probably the first public teacher of political economy in Spain. The uncompromising tone of his lectures and the enthusiastic success of the public discussions which the Royal Aragonese Society organised under his inspiration in Saragossa, were near bringing him into trouble with the Inquisition. His *Discurso sobre la utilidad de los conocimientos económico-políticos y la necesidad de su estudio metódico* (Saragossa, 1784) is the inaugural address, which he delivered at the beginning of his course of lectures. The *Proposiciones de Economía civil y Comercio* and the *Espíritu del Sr. Melon* (1785 and 1786) were written to serve as subjects of debate in the above-mentioned disputations.

[Colmeiro, *Bibl. de Economistas Españoles*.]

E. ca.

NORTH, SIR DUDLEY (1641-1690), entered, at an early age, the mercantile profession, and showed such aptitude that, when twenty-one, he became the leading merchant at Constantinople of the Turkey company. He returned to England in 1680, having made a large fortune. In 1683 he was appointed one of the commissioners for the customs, but was afterwards transferred to the treasury. In both these offices he carried out important reforms. At the accession of James II. he returned to the customs. He was the author of a bill imposing new duties on sugar and tobacco. Unlike most of the leading Tories, he did not leave London after the landing of William of Orange. The remaining years of his life were

occupied in private speculations and in the care of the affairs of his brother the Lord Keeper Guildford's children. We are told that he was much scandalised at the English POOR LAW (*q.v.*), but unfortunately his views have not come down to us.

His importance, in the field of economics, rests on his *Discourses on Trade*, London, 1691, 4to, one of the earliest and most luminous statements of FREE TRADE (*q.v.*) principles. Trade is an exchange of superfluities. Wealth consists not in the precious metals, but in the power to satisfy wants. The error of the MERCANTILE SYSTEM (*q.v.*) is thus clearly seen, but North avoids the opposite error. Gold and silver have some value in themselves, though their main importance depends on their convenience as a medium of exchange. Money is a commodity of which there may be a glut as well as a scarcity. The common cry of want of money involves a fallacy. The real mischief is the failure to get a profit. This may be the result either of a glut of goods, or of the sudden closing of accustomed markets, or of diminished consumption. It is these causes which require remedying, and the best remedies are activity and prudence. Laws against exporting the precious metals must react against the nation enacting them. "A nation in the world, as to trade, is in all respects like a city in a kingdom, or a family in a city." The main spur to trade are the appetites of man; hence measures, *e.g.* sumptuary laws, which tend to restrain those appetites, clog industry. The rate of interest depends upon the proportion of lenders to borrowers (see D. HUME). "It is not low interest which makes trade, but trade increasing the stock of the nation makes interest low. To attempt to lower the rate by law is to go contrary to nature." As for the theological arguments, "by them 3 per cent is no more lawful than 4 or 12." North clearly demonstrates the folly of tampering with the coinage. He advocates a moderate seignorage, the wisdom of which advice was proved by the result of the free coinage of silver in 1696-98. The final conclusion of the whole matter is "that laws to hamper trade, whether foreign or domestic, relating to money or other merchandise, are not the means to make a people rich and abounding in money and stock. But if peace be procured, easy justice maintained, navigation not clogged, the industrious encouraged by indulging them in the participation of honours and employments in the government, the stock of the nation will increase, and consequently gold and silver abound, interest be easy, and money cannot be wanting."

[Roscher's *Political Economy*, 13th ed. trans. by J. Lalor, New York, 1878, 8vo, 2 vols., contains numerous references to North. See also Cossa's *Political Economy*, trans. by L. Dyer,

1893, 8vo, and McCulloch's *Literature of Political Economy* and Introduction to *Tracts*, 1856. For biographical details see *Life of Sir Dudley North* by Roger North, 1744, 4to, and *Dictionary of National Biography*, vol. xli.] H. E. E.

NORTH, THE HON. ROGER (1650-1733), was the sixth son of the fourth Lord North. He read for the bar.

His connection with economic science lies in his authorship of *A Discourse of the Poor, showing the pernicious tendency of the laws now in force for their maintenance and settlement* (London, 1753, 8vo). In this work, after setting forth the existing laws and their inefficiency, North deprecated the use of punishments, which he thought did not influence offenders so effectively as laws of encouragement. He further maintained that the laws for the poor did not help but rather hurt them, and charges these laws with the following consequences: depopulation, enhancing of labour, fall of lands, decay of trade, and increase of the poor.

North proposed the repeal of the whole Elizabethan code.

His other publications are:

*Examen: or an Enquiry into the credit and veracity of a pretended complete History, viz. Dr. White Kennet's History of England, showing the perverse and wicked design of it, together with some memoirs occasionally inserted, all tending to vindicate the honour of King Charles II.*, London, 1740, 4to.—*Life of the Right Hon. Francis North, Baron Guilford, Lord Keeper of the Great Seal under Charles II. and James II.; wherein are inserted the characters of Sir Matthew Hale, Sir George Jeffries, Sidney Godolphin, and other most eminent lawyers and statesmen of that time*, London, 1742, 4to, 2nd ed. 1808, 2 vols., 8vo.—*The Life of the Hon. Sir Dudley North, and of Dr. John North, Master of Trinity College, Cambridge, etc.*, London, 1744, 4to.

[For further notice of R. North, see his *Autobiography*, edited by Ang. Jessop, 3 vols., 1890, Bohn's Standard Library, 1846, 8vo.] A. L.

NORTHCOTE, SIR STAFFORD. See INDES-LEIGH, EARL OF.

NOT NEGOTIABLE. The method of crossing cheques with the words "not negotiable" was introduced by the Crossed Cheques Act 1876. That act is now repealed, and its provisions are replaced by §§ 76-82 of the Bills of Exchange Act 1882. The term "not negotiable" is a somewhat unhappy one, because it is often taken to signify that a cheque so crossed is not transferable. As a fact, however, the cheque is transferable, by indorsement on delivery like any other cheque. The effect of the crossing is that the person who takes the cheque does not acquire, and cannot give, a better title to the cheque than that which the person from whom he took it had (see § 81).

In order to render a bill, note, or cheque incapable of transfer, the drawer or indorser must add words to the instrument or indorse-

ment clearly prohibiting transfer. For instance, a cheque may be drawn or indorsed in the form "pay John Smith only," and then John Smith cannot indorse it away (Bills of Exchange Act, § 8).

M. D. C.

NOTABLES, ASSEMBLÉES DES. The *Assemblées des Notables* must be distinguished from the *ÉTATS GÉNÉRAUX* of the old French monarchy; the latter were more or less a national representative body, whilst the former were the result of an arbitrary selection and summons by the monarchs, when they desired to consult on important questions, but intended to keep free from the remonstrances and interference of the States General themselves. Higher officials of the state, lay and ecclesiastical, often made up the majority of the *Assemblée*; its decisions were purely consultative. The first *Assemblée des Notables* was called together by Charles V. in 1369; others were assembled by Louis XI. in 1470, by Francis I. in 1526 (to declare void the treaty of Madrid), by Henry IV. at Rouen in 1596, by Richelieu in 1626. They were convoked for the last time in 1787 and 1788 under Louis XVI. and led to the election of the States General of 1789, which was the first act of the French Revolution.

[See, besides works on the *États Généraux*, Beaupaire, *Louis XIII. et l'Assemblée des Notables de Rouen en 1617* (Rouen, 1883).—*Collection des Mémoires présentés à l'Assemblée des Notables* (Versailles, 2 vols. 1787) and *Procès Verbal de l'Assemblée des Notables* (Paris, 1788).]

E. CA.

NOTABLES COMMERÇANTS. The first tribunal of commerce in France was instituted by an edict of Charles IX. (November 1563), inspired by the Chancellor de L'Hospital ordering the provost and *Echevins* (aldermen) to summon an assembly of notable *bourgeois* for the election of merchants to the position of consular judges. In 1565 this organisation was extended to the whole of the kingdom, and the articles 618 and 619 of the code of commerce of 1807 maintained it, declaring "that the members of the tribunals of commerce will be elected by an assembly composed of notable merchants, and principally of the heads of the oldest and most recommendable firms," with the proviso that "the list of notables . . . will be drawn up by the prefect (of the *département*) and approved by the minister of the interior." After 1840 it became usual for the prefect to take the advice of the tribunal and chamber of commerce and of the *maire*; in 1883 the electoral body was greatly extended, and now comprises all persons in trade being French citizens, paying their trade-license tax, *droit de patente*, and domiciled for at least five years within the jurisdiction of the tribunal. Since then, however, only a small minority of voters (say 1800 out of 42,000 in Paris) take part in the election.

In Belgium the system of *notables commerçants* has also been abandoned; a law of July 1881 declares that "all persons in trade being communal electors, and paying to the state on account of their *patente* [license] a sum of twenty francs, are entitled to vote for the formation of the tribunals of commerce." E. Ca.

NOTE CIRCULATION. The power of issuing notes, that is, of possessing a note circulation, was, in the early days of banking in this country, a privilege greatly valued, and highly profitable to the bank which possessed it. Deposit banking in its strict sense scarcely existed during the infancy of our credit institutions. In the first place, there was but little cash to deposit, and in the next, there were not many persons whose credit was so good that their neighbours would trust them with large sums of money. But to hold the note of a banker in good repute was much easier. The note formed a portion of the circulating medium. Any one to whom the holder owed money was very willing to be paid in that form, and hence, during the early part of the 19th century, the issues of the banks of this country, stimulated partly by high prices, partly by the restriction of specie payments, became very large indeed. Thus in the year 1814, the estimated note circulation of the country was nearly fifty millions, divided as follows:

Bank of England . . .	£26,901,000
Country Banks . . .	£22,709,000

---

£49,610,000

(see Marshall's *Digest*, pp. 55-63). At the present time, April 1907, the figures are about as follows:

Bank of England . . .	£28,800,000
Banks in England, Scotland, and Ireland . . .	14,000,000

---

£42,800,000

This diminution alone is evidence of the alteration in the banking habits of the country, but when we add to it the vast increase in the use of cheques, the clearing-house system, virtually built up within the last seventy years, and all the modern methods for economy of circulation, the difference is far greater, and the part played by the note circulation is now far smaller even than appears at first sight.

Yet it would be a great mistake to imagine that the note circulation is a thing absolutely useless to banks, or that its concentration in the hands of one issuer would be desirable. To a great credit institution like the Bank of England, possessing few branches and only coming in a very modified way into connection with the business wants of the country, the note circulation is a very different thing from what it is to the ordinary trading bank which serves the every-day business wants of the

community. The subject is too technical and too closely allied with ordinary business wants to be discussed at further length here.

[For further details see articles on BANKING AND BANK NOTE, in vol. i.—Bagehot, *Lombard Street*.—F. A. Walker, *Money*.—*Money, Trade, and Industry*.—*Report, Banks of Issue, 1840, House of Commons*.—*Report and Evidence, Bank of England Charter, 1832, House of Commons*.—*First and Second Reports, Banks of Issue, Evidence and Appendix, 1841, House of Commons*.—*Report and Evidence, Commercial Distress, 1847-48, House of Commons*.—*First and Second Reports and Evidence, Commercial Distress, 1848, House of Commons*.—*Appendix and Supplemental Appendix, Commercial Distress, 1848, House of Commons*.—*Report on Banks of Issue, 1875, House of Commons*.—*Report on Bank Acts, 1857, House of Commons, 2 vols.*—*Report and Evidence, Bank Acts, 1858*.—*Correspondence, Chancellor of the Exchequer and Bank of England, 1861, House of Commons*.—R. H. Inglis Palgrave, *Notes on Banking and Bank of England Analysis*, London, 1873.]

NOTES, BOUGHT AND SOLD. This is the name popularly given to notes sent by stockbrokers to their principals, advising them of the sale or purchase of any stock exchange securities. A person who effects such a sale or purchase of the value of £1 or upwards, who omits to send a note of this description to his customer provided with the government stamp (1d. in the case of the value being under £100, and 6d. in all other cases), is liable to be fined to the extent of £20 (Stamp Act 1891, §§ 52 and 53). The contract notes in question generally contain a clause stating that the contract is made subject to the rules and regulations of the London stock exchange, but this provision has in some cases been disregarded by the courts. Thus it was held by the court of appeal that the rule of the stock exchange, which excludes the operation of Leeman's act, is unreasonable and not binding on a principal to whom it is unknown.

[*Perry v. Barnett*, 15 Q.B.D., 388.] E. S.

NOTICE. Notice sometimes means knowledge of a fact, however obtained, and sometimes knowledge conveyed in a formal manner. In sales of property, knowledge on the part of a purchaser of any defect of title causes him to take the property subject to such defect. But he who purchases *bona fide* for value without notice of any defect will as a rule be protected by the courts on the ground that if a person were liable to be deprived of his property because of secret defects in title, no one would be safe in effecting any purchase.

As an example of express notice, reference may be made to the notice of dishonour that has to be given in the case of a BILL OF EXCHANGE in order to make certain parties to the bill liable.

Notice to quit is required whenever a person holds a tenancy from year to year, as such a tenancy

does not by itself involve any fixed time of duration.

Express notices are often necessary during an action in order to give one party the benefit of various legal provisions as against the other party.

J. E. C. M.

**NOTING OF BILLS.** By "noting" is meant the minute made by a notary public on a dishonoured bill or note on the day of its dishonour. The noting consists of the notary's initials, the date, the noting charges, and a mark referring to the notary's register. A label is also attached to the instrument on which is written the answer given to the clerk who makes the notarial presentment.

No direct legal effect is attached to the noting of an inland bill, except that the expenses of noting it can be recovered. It would be convenient perhaps if noting were made *prima facie* evidence of due presentment. In the case of foreign bills, when protest is necessary, the noting is the incipient protest, that is to say, if the bill has been duly noted on the day of its dishonour, the formal protest may at any time be extended, antedated to the day of noting.

[Bills of Exchange Act 1882, §§ 51, 57, 93. —Chalmers on *Bills of Exchange*, 4th ed. p. 160.]

M. D. C.

**NOVATIO** is the dissolution of an obligation by the formation of a new obligation, as when an informal contract is put an end to by the parties entering into a formal contract. But for the new obligation to put an end to the previous one there must be the intention that it shall do so (*animus novandi*). The object of a novation may either be to change the nature of the relation between the same parties or to substitute a new party in the place of an old one (see also **NOVATION**).

E. A. W.

**NOVATION.** The substitution of one contract for another. 1. Where a new debtor or creditor is substituted in the place of the former one. For example, if A owes B £100, A may, with the consent of B, substitute C in his (A's) place. 2. Where the parties to a contract remain, but a new form of contract is substituted for the old one. 3. A judgment of a court of competent jurisdiction in favour of a plaintiff discharges the right of action arising from breach of contract. This result is sometimes called **MERGER**.

[See Hunter's *Roman Law*, London, 1885, and Sohm's *Institutes of Roman Law*, Oxford, 1892, for the Roman law doctrine; and Anson on *Contract*, Oxford, 1892, and Pollock on *Contract*, London, 1894, for the application of the doctrine in English law.]

J. E. C. M.

**NOY, WILLIAM** (1577-1634), a very learned lawyer, was educated at Exeter College, Oxford. He entered parliament in 1604, and at first supported the popular party. In 1627 he was one of the counsel who defended Sir T. Darnell's comrade, Earl, for having refused to subscribe to the forced loan of that year; and in the follow-

ing year he opposed the granting of **TONNAGE AND POUNDAGE** (*q.v.*) without conditions. In 1631, however, he became Attorney-General. Finding, by what Lord Campbell calls "musty records in the Tower," that in time of war the king had in the past pressed ships into his service, had further demanded from seaports the equipment of ships, and, on occasions, had ordered adjoining counties to contribute, he, "with his own hand, drew and prepared the writ for ship money," addressed to the sheriffs to provide ships of war, and to assess landholders and others, not having a ship or part of a ship and not serving in one; to levy such assessments by distress or other due means, and to commit to prison the rebellious.

Noy did not live to see the consequences of his measure, as he died in the year in which it was first enforced. He was also the author of the odious project of a soap monopoly. His character is sketched for us by Clarendon in a few vivid sentences. "The court made no impression upon his manners, upon his mind it did . . . of an affected morosity . . . Thinking that he could not give a clearer testimony that his knowledge of the law was greater than all other men's than by making that law which all other men believed not to be so."

Noy was the author of *A Treatise of the Principle Grounds and Maxims of the Laws of England*, London, 1641, 4to, which has passed through many editions. The latest, Albany, U.S., 1870, 8vo, contains a biographical notice. *The Compleat Lawyer*, 1661, 8vo.—*The Perfect Conveyancer*, etc., 1655, 4to.—*Reports of Cases taken in the Time of Queen Elizabeth, King James, and King Charles I.*, London, 1656, 4to; and *A Treatise of the Rights of the Crown*, first published apparently in 1715, 12mo. Noy also left behind him MS. collections he had made from records in the Tower of London, one on matters relating to the maintenance of the royal navy, the other on the privileges and jurisdiction of the ecclesiastical courts.

[*Dictionary of National Biography*, vol. xli. p. 266.—Clarendon's *History of the Rebellion*, vol. i. p. 129, new ed. Oxford, 1826, 8vo.—Campbell's *Lives of the Lord Chancellors*, vol. ii. ch. 62, London, 1845-48, 8vo. Many authorities will be found set out in footnotes of the biographical notice mentioned above. For the arguments upon the legality of ship-money, see Cobbett's *State Trials*, iii. 826-1254.]

H. E. E.

**NUDUM PACTUM.** An agreement unenforceable at law. An agreement that wants that element the presence of which will make the law enforce it, is said to be *nudum*. *Ex nudo pacto non oritur actio*. In Roman law agreements were enforced when made (1) by formal words; (2) by delivery of a *res* in four cases; (3) by written entry in an account book; but in four cases, viz. sale, hire, mandate, and partnership, the later Roman law required an agreement only. In English law an agreement is not enforceable unless it is either (1) a con-

tract of record, (2) made under seal or (3) supported by a consideration.

[Sohm's *Institutes of Roman Law*, Oxford, 1892.—Anson on *Contracts*, Oxford, 1892.] J. E. C. M.

NUMERICAL DETERMINATION OF THE LAWS OF UTILITY is the title given by Jevons (*Theory of Political Economy*, 2nd ed. p. 158) to an operation which he, like GOSSEN, regards as possible—the ascertainment of the form of DEMAND CURVES by statistics of prices and consumption. It may be objected to this phrase, that laws of utility cannot be deduced from laws of price, except on the assumption that price is the measure of utility—the Marginal Utility of money being constant (see FINAL DEGREE OF UTILITY). But, even upon this assumption, there are great difficulties in the way of the statistical operation. First, the utility derived from a set of articles is in general not the simple sum, but some unknown function, of the utilities derived from each. Thus the amount consumed of any one article will vary with the prices of others—especially of those which are substitutes for the one under consideration, as tea is for coffee, or complementary to it, as bats are to balls. Accordingly, to observe the changes in the demand for an article corresponding to the changes in its price is apt to be nugatory unless it can be assumed that the prices of all other articles are constant. Again, utility is not only

a complicated function of the amounts consumed, but a variable one, changing its form with every vicissitude of taste and fashion. Professor Marshall has pointed out these and other difficulties (*Principles*, bk. iii. ch. iii.), and attempted to evade them (*ib.*, last section). F. Y. E.

NUYTZ, GAETANO (18th-19th century), was a native of Lombardy, and wrote a book on money of some interest. Nuytz follows the ideas common in his day distinguishing between intrinsic and current value of money. He condemns alterations in money and considers laws against the export of specie useless. He remarks on the conveniency of an abundant coinage up to a certain limit of saturation in the market, and he also recognises the use of paper money in limited quantity. He is not without mercantilist tendencies (see MERCANTILE SYSTEM), which he displays in his investigation into the causes that may increase or diminish money, and also in his proposals for increasing it. There are, in his work, several striking digressions on the theory of value and on luxury and financial matters.

On the whole, however, he has little scientific merit, particularly when compared with other and earlier writers, as well as with those of his own day whose economic ideas were already inspired by new modes of thought.

*Forza della moneta nella società*, Milano, Anno VI. repubblicano. U. R.

OASTLER, RICHARD (1789-1861), known during his lifetime as the "Factory King" on account of his services to workers in factories, was born at Leeds. His father, originally a linen merchant from Thirsk, afterwards became steward of the Fixby (Huddersfield) estates of T. Thornhill, who had property in land both in Yorkshire and Norfolk. Richard Oastler was the youngest of eight children, and inherited from his father both a reputation for generous sympathies and an active interest in public affairs. On his father's death in 1820 he succeeded him as steward, and in this capacity resided at Fixby Hall, near Huddersfield, where he remained during the most important part of his career. Oastler described himself as "a Tory and a Churchman," and it is therefore not surprising to find that during the agitation for the Reform Bill he strenuously opposed the popular party; even some years later he was averse to mingling personally among mill-hands because, he said, "they were usually Radicals and Dissenters." But his work soon changed this attitude. He first came before the public in Yorkshire as a supporter of William Wilberforce in the agitation for the abolition of negro slavery (see ABOLITIONIST); but though living in the heart of manufacturing Yorkshire, he was totally

ignorant of the unhappy conditions of the factory hands in the mills near him. In 1830, however, while on a visit to his friend John Wood, a mill-owner, of Horton Hall, Bradford, Yorkshire, the latter remarked to him, "I wonder you have never turned your attention to the factory system, for I assure you there are cruelties daily practised in our mills on little children which, if you knew, I am sure you would strive to prevent." With characteristic energy, Oastler at once wrote a powerful letter on "Yorkshire Slavery" to the *Leeds Mercury*, then, as now, a highly influential West Riding paper. The letter, dated 29th September 1830, provoked a lengthy correspondence. More than this, it was the beginning of an agitation that lasted many years, for the reform of the conditions of factory labour, especially in the case of children and young persons, and for a reduction of hours of work, which finally resulted in the Ten Hours Bill, and other well-known FACTORY ACTS (*q.v.*). In this agitation Oastler took a leading part both in speaking and writing. Meanwhile, however, he had the misfortune to be imprisoned for debt at the instance of his employer, Mr. Thornhill. He had been dismissed from his stewardship in May 1833 owing to his using his influence in the Halifax and Huddersfield

districts against the new poor law, and though he had repaid all but a small portion of a debt which he owed Mr. Thornhill, he was, two years after his dismissal, thrown into the Fleet Prison (9th December 1840) for this remainder. Here he edited a journal called the *Fleet Papers*, devoted to the discussion of factory and poor-law questions. He remained in prison till his friends, including John Walter of the *Times*, W. B. Ferrand, M.P., John Fielden, M.P., and other well-known factory reformers, got up an "Oastler Liberation Fund" amounting to £3000 to pay his debt (£500 only) and other expenses. He was liberated in 1844, and made a triumphant public entry into Huddersfield, 20th February. He continued his labours as a reformer till the passing of the Ten Hours Act of 1847, but afterwards retired to a small cottage, "South Hill," at Guildford in Surrey, where he lived in poverty and seclusion till his death at Harrogate (22nd August 1861).

Oastler's claim to notice lies in his activity as a reformer of the worst evils of factory life, in spite of bitter opposition. In his opinions he was a protectionist, and opposed the new poor law. A statue was erected to his memory (1869), at Bradford, Yorks, the scene of many of his labours, but he is now almost entirely forgotten by the working classes to whom he gave his life.

[No proper biography of Oastler exists, but one or two sketches of his life have been issued: cp. *Sketchs of the Life and Opinions of Richard Oastler* (Hobson: Leeds, 1838, many years before his death); Taylor's *Biographia Leodiensis*, pp. 499-503; *The History of the Factory Movement* by "Alfred" (the pseudonym of Samuel Kydd), London, 1857, gives as good an account of him as any other book, with many extracts from his speeches; and there is a fair biography in the *Dictionary of National Biography* (Smith Elder, 1895); cp. also Gibbins' *English Social Reformers*, (Methuen, London, 1892). Oastler issued numerous controversial letters and pamphlets, now forgotten, and besides *The Fleet Papers* (1841-44), edited a weekly paper devoted to the factory workers' cause, called *The Home* (May 1851 to June 1855).] H. de B. G.

OBJECTIVE EXCHANGE VALUE. See VALUE.

OBLIGATIO is a legal relation by which a determinate person has a legal claim against another determinate person to some act or forbearance on his part reducible to a pecuniary value. Such a relation may arise either from contract, quasi-contract, delict, or quasi-delict.

E. A. W.

OBLIGATION. By the older writers on English law, the term "obligation" is used in a restricted sense. It denotes simply a bond under seal, with a money penalty. But now it is used in the wider sense of the Roman lawyers, who employed the term as correlative to *jus in personam*. An obligation is the legal tie (*juris vinculum*), whereby one person is bound to

another, to do or abstain from doing some particular act or thing. There is probably a tendency to confine the term to obligations arising from contract, while the obligations arising from wrongs are more usually described as liabilities (see Holland's *Jurisprudence*, ed. iv. p. 199). M. D. C.

OBRECHT, GEORGE (1547-1612), the son of a *syndic*, mayor, of the city of Strasburg, studied law in Tübingen and in France, where he narrowly escaped death during the massacres of protestants at the time of the Saint Bartholomew. He was a celebrated professor of law in his native town, where the *gymnasium* founded by Johann Sturm, in 1538, developed (1621) into a university, and became, after the decay of the Saxon universities, a flourishing centre of academical learning very much under the influence of learned Frenchmen, especially of BODIN (*q.v.*).

Obrecht's economic writings were, after his death, privately printed in 1617 by his son. They were only published in 1644 under the title of *Fünf verschiedene Secreta Politica*. They bear strong evidence of the influence of Bodin; thus Obrecht maintains that the property and not the persons of the subjects ought to be assessed, and that necessities ought never to be taxed. At the same time, Obrecht remained free from any leanings to the mercantile school. He insisted on an honest monetary policy, as well as on the usefulness of population statistics, but under this last respect with fiscal, rather than scientific aims.

In imitation of Bodin, who himself had been influenced by the existence in Italy of institutions founded to endow young girls at the time of their majority, Obrecht suggests the foundation of an *Aerarium Liberorum* extended to children of both sexes, in which parents would be obliged to effect a deposit at the time of the birth; the deposit was to bear a yearly interest of 6 per cent, which being capitalised, the whole was to be repaid to the children at the age of twenty-one for the sons, and seventeen for the daughters. But here also, fiscal prepossessions were lurking under the appearance of a provident system, for in case of death in the interval, the larger part of the collected money was to accrue to the public treasury.

Obrecht has been considered as a striking personification of his time, but not in advance of it (Roscher, *Geschichte der Nat. Oekonomie in Deutschland*, pp. 150-158). For his standing as a jurist, see Stintzing, *Geschichte der deutschen Rechtswissenschaft*, vol. i. pp. 672-676, who also mentions that in 1617 an unauthorised and spurious edition of the *Secreta Politica* appeared in Rostock (1617) under the title of *Oeconomia Institutionum Obrechtiana*. E. C.

OBSERVATION AND EXPERIMENT. Every science is founded on experience. The scientific inquirer either may take experience as it comes to him, casually, or he may make experience for himself. In the former case he

learns by observation, in the latter he learns by experiment. Observation is our ordinary, and in some branches of science our only, resource, but experiment, where it is possible, affords a more direct access to knowledge. For if the student conducts his experiment in a scientific spirit, he knows all the conditions which can affect the result, whereas, when he merely observes, he can be far less certain that his observation has been exhaustive. The phenomena of nature are so complex and so interdependent that they usually admit of a variety of explanations, and even protracted and careful observation may not afford the crucial instances which would enable the inquirer to reject all the explanations which are unsound. At the same time observation and experiment are not to be regarded as distinct methods. Experiment is but a means of extending the field of observation.

In economic research both observation and experiment are attended with peculiar difficulties. The aid of experiment is rarely available. The close relation between economic phenomena and other elements of human welfare usually forbids the production of economic phenomena at will. Even when an economic experiment is tried, it is usually tried under circumstances which deprive it of most of its scientific value. An employer may introduce an eight hours' day in his works, or a board of guardians may suppress outdoor relief, and the results of either of those experiments may afford valuable information. The change may be made so rapidly as to produce its effect before the conditions, which may be comparatively simple, can be appreciably altered. Yet even in cases such as these we can by no means exclude the action of the plurality of causes. The workman whose day of labour is experimentally shortened may have a peculiarly strong motive to efficiency which might disappear if the reduction of hours had received the sanction of law or custom. The suppression of outdoor relief in one union may give idle and thriftless persons a motive for flitting into other unions. When we pass to innovations of wider scope, we find ourselves still more remote from the conditions of scientific experiment. The effects of an important law or a far-reaching invention are inextricably mingled with the effects of many other causes. That the effects of steam-power or of a policy of free trade have been immense, nobody will deny. But how much of our present economic state is due to the one or the other no one will attempt to describe with absolute accuracy. Many other potent causes have co-operated in producing our modern economic order, and the effects are inextricably blended and interfused. We may say, therefore, that experiments sufficiently accurate to satisfy the standard set by physical inquirers are practically impossible in political economy.

Observation, therefore, is almost the sole means of obtaining the knowledge of facts required by the economist. But observation, as a source of scientific knowledge, labours under two distinct disadvantages, the plurality of causes and the intermixture of effects. The same phenomenon may have been produced in different instances by different combinations of causes. And again the effects of many causes may be intermixed in the one phenomenon. Both of these disadvantages may be experienced in attempting the same economic observation. They may be partially overcome by enlarging the field of observation as widely as possible. But even then the observation which is most fruitful for economics "is in the main not observation of complex economic facts, but of elementary economic forces and the conditions under which they operate. It is by the agency of those forces that complex economic facts are built up" (Keynes, *Scope and Method of Political Economy*, p. 166). Thus little can be done by mere collection of instances towards ascertaining the respective effects of such forces, for example, as free trade and protection. Nor can the "personal error" of the observer be eliminated as in cases where more exact methods of "justifying" observation are possible.

Whether observation is complete or not, it cannot be carried out satisfactorily without the aid of theory, and the theory may require much modification after its first inception. When a theory clashes with a fact it must be modified or abandoned, but a new theory must inevitably take its place. Students of economic history who come into collision with theories derived from the experience of one age, and too hastily applied to explain the facts of another, are apt to forget that theorising is both inevitable and beneficial. Whether they are aware of it or not they are themselves theorists. For economic history involves, over and above the accumulation of facts, some criterion of the importance of those facts, and some scheme for their arrangement which must be supplied by the mind of the historian.

Yet the economist enjoys an advantage in observation which may be turned to good account. A student of human action, and himself a human being, "he starts with a knowledge of ultimate causes" (Cairnes, *Logical Method of Political Economy*, p. 75). The student of physical science does not possess this advantage. The man in the street knows why mankind desire riches. But the most profound inquirers took thousands of years to discover the nature of the forces which keep the earth in its orbit. The economist must indeed remember that human nature, whilst almost unchangeable in its primary attributes, is infinitely variable in its secondary manifestations. Inference from his own nature to the nature of other men is dangerous no doubt, but it is very helpful.

The economist may therefore proceed deductively so long as he is careful to test his results by recorded experience. Observation of external facts is rather the corrective than the basis of his studies. On account of this peculiarity of economics, a substitute for experience may, as Cairnes remarks, be found in the construction of hypothetical cases. In political economy hypothesis "is never used as a help towards the discovery of ultimate causes and laws; just as in physical investigation it is never used as a substitute for experiment" (*Logical Method*, p. 84). It is only right to add that we should never forget the abstract character of the results obtained in this manner.

C. M.

OCCUPATIO is the acquisition of ownership by taking possession of a thing belonging to no one, such as a wild animal, a derelict, or thing abandoned by its owner; property of a public enemy, etc. E. A. W.

OCCUPATION. In Roman law the (OCCUPATIO) taking possession of a thing that belonged to nobody with the intention of becoming owner of it gave the occupier the right of ownership. In this way ownership could be acquired over wild animals or derelict property. The doctrine has descended to modern law, and in England has been applied to the capture of wild animals, the appropriation of free natural elements, the collection of substances from the sea or shore, and the severance of articles from trees or from the soil. Probably it would also be applied to the finding of a thing which has been absolutely abandoned by, or has become irrecoverably lost to, its former owner. See Pollock and Wright's *Possession in the Common Law*, Oxford, 1888. In Roman law, however, there was no property in game.

The doctrine was applied to a limited extent in the case of real property. If A were granted an estate for the life of B and A died before B, the first person to occupy the land could retain it until B's death. This was abolished by 29 Car. II. c. 3, § 12; 14 Geo. II. c. 20, § 9; and the 7 Will. IV. and 1 Vict. c. 26, §§ 3, 6. The doctrine has also been applied to support the appropriation of new countries by European states. Discovery followed by occupation was considered to give a good title.

[For an account of the Roman law doctrine, see Hunter's *Roman Law*, London, 1892; and for its

application in international law, see Maine's *Ancient Law*, London, 1886, and Phillimore's *Int. Law*, London, 1879-1889.] J. E. C. M.

OCHR.-EL-GUERCH. The smallest denomination of the Egyptian currency, as reorganised by the Khedivial decree of the 14th November 1885, is the Ochr-el-Guerch, ten of which are equal to a piastre; while 100 piastres make an Egyptian pound, the standard of value.

Five coins bear the name Ochr-el-Guerch, as follows:

Nickel 5 Ochr-el-Guerch	Bronze $\frac{1}{2}$ Ochr-el-Guerch
" 2 " "	" $\frac{1}{4}$ " "
" 1 " "	" " "

F. E. A.

OCTROI. France and (under the name of *dazio interno di consumo*) Italy are now the only countries where octrois or taxation of urban consumption play a prominent part in local finance. They began to spread in France during the 14th century, and as they required a royal concession or *octroi*, the kings always stipulated that their treasury should take a share of the proceeds—one half from 1663. Suppressed with all other indirect taxes in 1791, they were re-established for Paris in 1799 under the designation of *octroi municipal et de bienfaisance*, and the provincial municipalities were empowered to do the same by a general law of the following year (*loi de frimaire, An VIII.*); they have been several times the object of general legislation, especially in 1814, 1816, 1871, and 1884. In a general way, *octroi* duties are only allowed on (1) drinks; (2) eatables (wheat, flour, bread, and colonial produce, already liable to customs, excepted); (3) fuel; (4) fodder; (5) building materials, with legally fixed maximum rates graduated and rising with the number of the population. They may not assume the character of a local protectionist tariff, nor of a toll on transit and transports. To prevent contraband, smaller *communes* surrounding a large town may, with the preliminary sanction of government, be made subject to its *octroi*, but all monies levied on their territory must be paid over to them. A new *octroi* can only be established by a statute, and every increase of *octroi* duties must be ratified by the superior authorities. As the state levies taxes on drinks at the entrance of towns, the *octroi* duties on such may not, without its agreement, exceed those exacted by the state. Until 1855, one-tenth of the proceeds was made over to the latter. This forced contribution was then suppressed; since 1881, one-fifth is to be applied to primary education.

Owing to the latitude left within these limits to the 1500 great and small French *communes* possessing *octrois* in 1894, and representing together one-third of the population of France, owing to the complexity of local financial wants, of ways of perception (about one-half of the *octrois* being farmed or managed by the

state), and also of local consumption (varying, for instance, between wine, cider, and beer), average numbers convey a very inadequate notion of the sums paid per head of urban population, of the proportional cost of collection, etc. Taking the twenty chief towns of France, the cost of collection fluctuates between 5 per cent (Paris) and 14·65 per cent (Bordeaux), the general average being 8·09 per cent. In this respect a considerable improvement has been

realised within the last sixty years; formerly the same average oscillated between 20 and 25 per cent. In Paris each inhabitant pays 58 francs (say £2:6:8) a year, of which 19 francs (15s. 10d.) is on wine, and 13 francs (10s. 10d.) on eatables, whilst for the rest of France the total average is only 13 francs (10s. 10d.); the gross proceeds amount to about £12,000,000 sterling, whereof one half for Paris alone. The staple articles are taxed as follows in Paris:

Wine (per hectoliter = 22 gallons) . . .	10·62 francs (8s. 10d.), yielding in 1890	47 millions of francs (£1,880,000)
Pure alcohol (contained in spirits, liquors, etc.) . . .	79·80 " (£3:6:6) " " "	18 " " (£520,000)
Butcher's meat (per 100 ks. = 222 lbs.) . . .	9·78 " (8s. 1d.) " " "	10 " " (£400,000)
Butter " " . . .	14·40 " (12s.) " " "	2·8 " " (£112,000)
Cheese " " . . .	11·40 " (9s. 6d.) " " "	1 " " (£40,000)
Coals " " . . .	0·72 " (7d.) " " "	10 " " (£400,000)
Oats " " . . .	1·50 " (1s. 8d.) " " "	2·6 " " (£104,000)

The *octroi* also collects on wine and alcohol, at their entrance in Paris, a supplementary tax of 8·25 (6s. 10d.) and 186·25 (£7:8s.) francs per hectoliter on account of the national revenue, thus burdening the ordinary beverage of the Parisian workman with a total tax equal to the cost of inferior wines when leaving their native vineyards. Objections have often been raised to the principle of an *octroi* duty, and its abolition demanded; but it would be a very arduous reform to carry out under the actual conditions of French finance, general and local. It would no doubt be feasible in smaller places, but in Paris, where it provides more than one half of the ordinary municipal receipts—145 millions of francs (£5,800,000) out of 267 (£10,680,000),—it seems well-nigh impossible to discover an appropriate substitute, and, invoking the plea of necessity, most French financial economists, though admitting that *octrois* are an evil, would endorse Prof. Wagner's dictum, that "its maintenance constitutes the financially least objectionable and relatively even the best system" (*Finanzwissenschaft*, iii. p. 915). Still, even those who do not see their way to a radical suppression, demand a mitigation of the dues on the so-called hygienic drinks (wine, beer, and cider), which, to influence retail prices, would, on account of the duties levied for the state, require an agreement between the state and the municipality. This plan is advocated by M. Paul Leroy Beaulieu (*Économiste Français*, 23rd and 30th April 1892, and 10th February 1894). M. Léon Say is willing to go further than this; he proposed, at a meeting of the *Société d'Économie Politique*, a general redistribution of general and local, direct and indirect taxation (*Journal des Économistes*, December 1891, pp. 449-461).

The most usual objection to *octrois* is that they press heavily on the means of urban consumers, especially of the working classes. This objection is undoubtedly valid in Paris as to the dues on drinks, but even including the latter, M. Paul Leroy Beaulieu comes to the conclusion that a working man only pays in Paris 22 or

23 francs (18s. 4d. or 19s. 2d.) for his yearly share; he, besides, enjoys exemption from the tax of 11 per cent on house rent, since he generally pays for himself and family 300 francs (£12), and all house rents under 500 francs (£20) are exonerated (*Traité des Finances*, i. pp. 735-737). It is not at all certain that this same workman would be appreciably benefited by the suppression of the moderate dues (say 5 per cent) on butcher's meat, butter, and the like articles, the difference between retail and average prices of these articles, when sold by the farmers and rural breeders, being enormous and out of all proportion to the dues. The same difference exists between the price of corn and the price of bread, both of which are free, and their dearthness must be ascribed to bad trade organisation. It should also be noticed that, in Belgium, the abolition of *octrois* thirty years since produced no marked influence on the price of victuals, at least in large towns like Brussels, Antwerp, and Ghent. The suppression of low *octroi* duties, and a slight reduction of high duties, such as those on wine, would probably be far more beneficial to tradesmen and dealers than to the lower and middle class consumer; the latter would be much more pinched by an increase of the tax on house rents, an increase often pointed out as the financially most promising substitute. The plan followed in Belgium in 1860—the raising customs and excise duties, and paying over the surplus thus obtained as well as a percentage of the postal revenue to the *communes*,—would bring about the relief of the urban at the partial expense of the far more numerous rural population, which, in the present political state of France, would resent this method of reform. All these considerations render it probable that the total abolition of *octrois* is not to be expected in France unless in a very remote future. Still the municipality of Lyons has this year (1895) voted the principle of the abolition of its *octroi*.

Outside France and Italy taxes on urban consumption exist in a few continental towns,

for instance, in Bavaria, and in the chief towns of Austria, but here the "open country" (*das flache Land*) is also subject to them, although in a lesser degree than the "enclosed towns" (*geschlossene Städte*). For an instance of *Octroi* in Glasgow in the days of Adam Smith, see *Life of Adam Smith*, by John Rae, p. 67.

Besides the already mentioned works and the leading French treatises on finance, see, among recent works, Guignard, *De la Suppression des Octrois*.—Carré, *Suppression des Octrois de la Ville de Paris*.—Saint Julien and Bienaimé, *Histoire des Droits d'Octroi à Paris*.—Lesourd, *Législation des Octrois*.—Yves Guyot, *La Suppression des Octrois* (Report to the Chamber of Deputies, 1889).—Tramuset, *La Réforme de l'Octroi et de l'Impôt des Boissons*.—Cohn, *Finanzwissenschaft*, pp. 647 et seq.—Reitzenstein, *Conrad's Jahrbücher*, vols. xlii. and xliii.—Menger, *Zusammenstellungen zur Reform der Verbrauchssteuer* (Vienna, 1887).—Bastable, *Public Finance*, pp. 481-488. The abolition of the Belgian *octrois* led to the publication of an extensive official report, entitled *Abolition des Octrois Communaux en Belgique—Documents et Discussions Parlementaires*. E. Ca.

ODDY, J. JEPSON (died 1814), merchant; was a member of the Russia and Turkey or Levant Companies.

He wrote *European Commerce*, etc., London, 1805, 4to, and *A Sketch for the improvement . . . as exemplified by the inland navigation of Europe in general and of England in particular, including details relating to the intended Stamford Junction navigation to unite the Eastern with the Midland and Western counties of England*, London, 1810, 8vo. Oddy unsuccessfully stood for parliament for Stamford.

ODEL TENURE. See UDAL TENURE.

OFFICIAL RECEIVER. Under the Bankruptcy Act 1883, certain persons have been appointed by the board of trade "official receivers" of debtors' estates. When a "receiving order" is made for the protection of the debtor's estate, an official receiver thereby becomes receiver of the debtor's property pending the appointment of a trustee.

Under the Companies Winding-up Act 1890, the official receivers have to discharge duties in the winding up of companies similar to those they perform in bankruptcy.

[Robson's *Bankruptcy*, 1894.—Lindley on *Companies*, 1891.] J. E. C. M.

OFFICIAL VALUES. This term was for many years a survival from the earliest attempts to record the value of British imports and exports. The office of inspector-general of imports and exports was constituted in 1697, and about the same time an official tariff was prepared for his guidance in computing the values of goods passing through the customs. This tariff was based on the existing prices of commodities, and, doubtless, for some years

very fairly represented actual market values. But as prices changed, the official rate of computation was continually diverging more widely from those actual values. When, towards the close of last century, statisticians came to deal with the figures of trade, it soon became notorious that they did not correspond to facts. Constantly in the closing years of the century the inspector of imports and exports would place separately on record his computation of real values. The first official step towards reform was made in 1798, when the new "convoy duty" (an export duty) was levied on declared value. From that time it was customary to record the exports both according to the official tariff and according to their "real value," as will be seen by the statistical tables from 1800 to 1854. In the latter year, computation according to real value in all customs statistics was inaugurated.

For some time it was argued that though the official values did not represent value, they were a guide to quantities: but the suggestion did not bear examination. The official value remains a statistical curiosity (see also IMPORTS AND EXPORTS).

[First Report of Customs Commissioners, app. v. 1857.—*Sessional Papers*, vol. iii.—Porter's *Progress of the Nation*, 1847, § 3, ch. ix.—M'Culloch, *Account of British Empire*, pt. iii. ch. v., note.] C. A. H.

OGILVIE, WILLIAM (1736-1819), after having completed his studies in Glasgow (1760-61) and Edinburgh (1761-62), became travelling tutor to Alexander, 4th Duke of Gordon, with whom he seems to have visited France and Italy; he was from 1762 to 1817 professor of philosophy and humanity at King's College, Aberdeen.

His anonymous tract, *An Essay on the Right of Property in Land with respect to its foundation in the Law of Nature. Its present establishment by the Municipal Laws of Europe, and the regulations by which it might be rendered more beneficial to the lower ranks of Mankind*, London, printed for J. Walter, Charing Cross, 1782, is alluded to in GODWIN'S *Enquiry concerning Political Justice*, 3rd ed. 1798, bk. viii. ch. iii. p. 459, and ch. ix. p. 515. "All riches," says Godwin, "and especially hereditary riches, are to be considered as the salary of a sinecure office, where the labourer and the manufacturer perform the duties, and the principal spends the income in luxury and idleness." In a footnote he adds: "This idea is to be found in an essay on the right of property in land, published about twelve years ago by an ingenious inhabitant of North Britain, pt. i. § iii. par. 38, 39. The reasonings of this author have sometimes considerable merit, though he has, by no means, gone to the source of the evil." Ogilvie, besides having inspired the father of English communism, may claim the honour to have been among the first advocates of agrarian reform, aiming at "an increase of the number of farmers, by favouring the movement of

day labourers and manufacturers, to the more animating and manly occupation of cultivating a small farm for their own account" (introd.). His theory, indeed, is more far-reaching. Starting from LOCKE's theory of property, he reasons that although "all right of property is founded either in occupancy or labour" (§ 1), "in every country where agriculture has made considerable progress, these two rights are blended together, and that which has its origin in labour is suffered to eclipse the other, founded in occupancy" (§ 8). The natural right to an equal share of the soil being thus in conflict, as in America, with the right to the additional produce of a fertile soil by labour, the problem of agrarian legislation consists in its solution. The present state of land-tenure not only allows the land-holder to monopolise the *original* and *accessory* or *improved*, but also the *contingent* or *improvable* value of the soil (§ 14). This is "a most oppressive privilege, by the operation of which the happiness of mankind has been for ages more invaded and restrained than by all tyranny of the kings, the imposture of priests, and the chicanery of lawyers taken together, though these are supposed to be the greatest evils that afflict the societies of human kind" (§ 28); "a monopoly which tends not less to the starving of their fellow-citizens, than a monopoly of bakers without any control or inspection of the magistrate would do. It will not produce its effects very suddenly, indeed, it is only a lingering piecemeal famine, under which the individual languishes, and the race becomes dwarfish, debilitated, and deformed" (§ 33). "What other cause than this pernicious monopoly can be assigned why population has been so long at a stand in Europe, and does not advance with nearly the same rapidity as in America" (§ 34, cp. also § 36). This passage seems to have been adopted by Godwin, and the fact is known to have served as a battle-ground to MALTHUS. Ogilvie certainly first accentuated the well-known sentence of A. SMITH, with whom he sympathises in matters of free trade, concerning the unearned increment (see INCREMENT, THE UNEARNED). "Whoever enjoys any revenue, not proportioned to such industry or exertion of his own, or of his ancestors, is a freebooter, who has found means to cheat or to rob the public, and more especially the indigent of that district in which he lives. But the hereditary revenue of a great landholder is wholly independent of his industry, and secure from every danger that does not threaten the whole state" (§ 39). By the abolition of this monopoly, the poor laws would be rendered superfluous; the tendency of reform in land must consist in uniting "the essential equality of a rude state with the orders, refinements, and accommodations of cultivated ages" (§ 43). Laws limiting the extent of land acquired by individuals could be introduced in new settlements; but the author sets his highest hopes, similar to the PHYSIOCRATS, in absolute monarchs; his ideal is a military and social royalty, as the prototype of which he proposes Frederick the Great (§ 49, 61, 74). For such events he proposes a scheme, "a progressive agrarian law," as he calls it, the principal points of which are the following:—That every citizen aged twenty-one years or upwards may, if not

already in possession of land, be entitled to claim from the public a certain portion, not exceeding forty acres, to be assigned him in perpetuity for cultivation and residence; that the claimant shall have right to choose the situation of his allotment on any farm, freehold, or uncultivated common within his own parish; this allotment shall be set apart, and its landmarks fixed by the magistrate, with the aid of an assize, etc.; the ground thus set apart shall be submitted to the cognisance of an assize, or of arbitrators, who shall determine what reserved perpetual rent the claimant must pay to the landlord, etc.; he is obliged to reside upon his farm, has right to transmit it to his heirs, but if he sells to another, who shall not reside upon it, one-tenth part of the price, or the reserved rent, shall belong to the public (§ 51). But if this reform would be made "wholly consonant to natural justice," it should be accentuated by the following provisions: "that lands acquired in this manner shall not be transmitted by will, but according to the established rules of succession to landed property, the original lord of the manor being *ultimus hæres*; no allotment shall be united to another by succession; it shall not be lawful to break down any such allotment in order to divide it among children, until in any county the uncultivated lands are wholly exhausted; persons acquiring such allotments shall be obliged to perform double service in the militia of their country; in every competition that may arise orphans and those that have served in the army or navy shall be preferred to all others; finally, the acquirers "shall pay to the lord of the manor certain aids and services of a feudal nature, so regulated as to produce that degree of connection and dependence which may be expedient for preserving order and subordination in the country without danger of giving rise to oppression and abuse" (§ 71).

In order to hasten the development of small farms, Ogilvie advocated a tax imposed on large farms and short leases, a tax on barren lands, and finally a tax on all augmentation of rents, which he seems to consider as an *impôt unique*, but within a sense approaching more to that of Mr Henry George than of the physiocrats. Ogilvie also proposes the appointment of a special board in order "to purchase such estates exposed to sale, and to divide them into small farms of a single plough only, to be given off in perpetual property for a full reserved rent" (§ 63). He suggests similar reforms to be introduced in India and Ireland (§ 74). Ogilvie's ideas, although insisting on the injustice of the landholder's monopoly, are rather similar to the aims of modern social politics with its "allotment," "homestead laws," with intended regulation of agrarian succession in Austria and Germany, than on the lines of land nationalisation. Like a modern Christian socialist, he appeals to an "alliance between the church and the plough" (§ 59). This explains as well the grounds of difference between him and Godwin, as the slender recognition of the merits of his little work among his English contemporaries.

*The Essay on the Right of Property in Land*

has been reprinted in 1838, 12mo, and recently edited with biographical notes by Mr. D. C. Macdonald, under the title, *Birthright in Land*, London, 1891. The editor has utterly failed to grasp Ogilvie's importance for economic history, but gives valuable references concerning Ogilvie and his contemporaries amidst much declamatory matter. He quotes: Pryse Lockhart Gordon, *Personal Memoirs*, London, 1830.—Donald Sage, *Memorabilia Domestica*, Wick, 1889.—Fr. Douglas, *A general description of the East Coast of Scotland*, Paisley, 1782.—Jas. Hall, *Travels in Scotland*, 1807.—M'Culloch, *Literature of Political Economy*.—Sir James Mackintosh, *Memoirs*, 1835.

[See M'Culloch's *Literature of Political Economy*, p. 310, for Sir James Mackintosh's unfavourable opinion of Ogilvie.] S. B.

OLIPHANT, CHARLES (19th century), writer to the signet, drew up the *Report on Friendly and Benefit Societies, exhibiting the law of sickness as deduced from Returns by Friendly Societies in different parts of Scotland, to which are subjoined tables showing the rates of contribution necessary for the different allowances, according to the ages of the members at entry, etc.*, issued by a committee of the Highland Society, Edinburgh, 1824, 8vo. The report is noteworthy as being the first serious attempt to work out a scale of contributions from trustworthy statistics. The inquiry was confined to the age and sickness of members, and was not extended to deaths. The tables of the average duration of sickness among persons of various ages were founded on the experience of 73 different benefit societies, belonging to 16 out of the 33 Scotch counties, both Lowland and Highland, and representing 104,218 years of life. The conclusions are to some extent vitiated by the fact that these societies contained many members who had joined from philanthropic motives, and had never made any claim to the benefits. In 1825 Oliphant gave evidence before the Select Committee of the House of Commons, which sat in that year and in 1827, the outcome of whose labours was the Act of 1829, 10 George IV. c. 56 (see FRIENDLY SOCIETIES).

[Baernreither, *English Associations of Working Men*, London, 1889, 8vo, p. 235, mentions the report.] H. E. E.

OLIVARES, DAMIAN DE (beginning of the 17th century). His *Memorial sobre las fábricas de Toledo*, presented to the *junta* or board convoked in 1620 by Philip III., in order to ascertain the causes of the decay of Spanish manufactures, gives statistical information on the quantities produced, wages paid, etc., in the silk and woollen manufactures of Toledo and the country around. An analysis of this *Memorial* was inserted by MARTINEZ DE LA MATA (*q.v.*) in his own *Memoriales* (pp. 22, 24, 34), themselves reprinted in CAMPOMANES' *Apéndice a la Educacion Popular* (Madrid, 1775). "The opinion," writes Olivares, "that trade with foreigners ought to go on, must certainly

be inspired by the devil, who is anxious to destroy a kingdom which God had preserved so Catholic and so Christian."

[Colmeiro, *Hist. Ec. de España*, p. 335.]

E. CA.

OLUFSEN, OLUF CHRISTIAN (1764 to early 19th century), was appointed in 1815 professor of political economy in the university of Copenhagen.

Olufsen was editor of the Danish *Economic Annals* (1797-1820). He published, in Danish, a *Treatise of Practical State Economy*, 1815, and an *Oversigt af National Industrien i Danmark*, 1819. The latter was translated into German, and published (1820) in Altona. E. CA.

ONE POUND NOTE. An issue of the pound notes has taken place at various dates and under various circumstances in England and Wales. They still exist and form a large part of the circulation of the issuing banks of Scotland and Ireland, nearly £5,000,000 out of £6,900,000 in the former case, and £2,500,000 out of £6,600,000 in the latter, being below £5, which is practically understood to be £1 notes, in March 1907. In England they never appear to have formed proportionately so large a part of the circulation. The Bank of England was allowed to issue them for the first time by the act of 1797, in which year also the country banks were permitted to do the same. This power, as far as the country banks were concerned, was withdrawn by the act of 1822, and the Bank of England withdrew its notes about the same period. Since that date to the present time no serious proposal has been made, till that of Lord Goschen in 1892, to employ one pound notes in England. Lord Goschen's plan was connected with the desire to increase the gold reserve at the Bank of England. As the arrangement would have increased the fluctuations in the reserve, it does not appear that any great stability could have been looked for. Lord Goschen proposed his plan without apparently having much confidence in it, and the feeling of the business community on its withdrawal was, on the whole, one of satisfaction. The lowest denomination issued by the Bank of France is for 50 francs (£2); the Bank of Germany 20 marks (£1); the Bank of Holland 10 florins (16s. 8d.). These small issues are, we believe, by the desire of their governments. After 1872 the Bank of France issued notes for 20 francs and 25 francs (16s. and 20s.), but withdrew them as rapidly as possible from the fact that they were forged with much facility. In the speech on the bank charter in the House of Commons, 6th May 1844, Sir R. Peel expressed a very strong opinion against the issue of notes for a lower sum than £5, in order to preserve an adequate amount of specie in circulation throughout the country.

[Tooke and Newmarch, *History of Prices*, vols.

i.-vi.—Malachi Malagrowther (Sir Walter Scott) on the *Proposed Change of Currency, etc.*, 1826.—R. H. Inglis Palgrave, *The Bank Acts of 1844-45 and the Bank Rate*, Institute of Bankers, 2nd March 1892.]

ONELY, REV. RICHARD (1723-1787), rector of Speldhurst, Kent, author of *An Account of the Care taken in most Civilised Nations for the Relief of the Poor*, London, 1758, 2nd ed., 1772, 8vo. The civilised nations dealt with are the Jewish theocracy, the early Christian church, the Egyptian, Greek, and Roman states. The pamphlet closes with a brief and bald epitome of the English poor laws. H. E. E.

ONEROUS PROPERTY, such as property consisting of land burdened with the payment of rent or other onerous covenants, shares on which there is a liability, unprofitable contract rights, etc., may be disclaimed by a trustee in bankruptcy within three months after his appointment, or within two months of his becoming aware of it. The disclaimer determines the interest of the bankrupt in the property, but does not affect the rights or liabilities of third parties (see MORTGAGEE). Leases may not be disclaimed without the consent of the court, and, as regards any onerous property, the power to disclaim is lost if the trustee, within a certain period of receiving a requisition from an interested party, fails to declare his intention. The damages arising through the operation of a disclaimer (e.g. the rent which a lessor loses by the disclaimer of a lease) are proveable as a debt in the bankruptcy. [Bankruptcy Act, 1883, § 55.] E. S.

ONEROUS UTILITY. See GRATUITOUS UTILITY.

OPEN FIELD SYSTEM. See MANOR and THREE FIELD SYSTEM.

OPEN POLICY (Marine Insurance). By a valued policy a valuation is put on the subject matter insured. On the other hand, an open policy does not fix the value of the subject matter insured, but, subject to the limit of the sum insured, leaves the amount payable by the insurer to be ascertained after loss. For the purpose of ascertaining the amount, certain more or less arbitrary rules have been worked out by the judges, who have hesitated between two conflicting principles of indemnity, but in the main have adhered to the principle that the assured ought to be put in the same position as he was in when the adventure commenced, and not in the position which he would have been in had it been carried to a successful termination.

[See Arnould's *Marine Insurance*, ed. 6, p. 67 et seq.] M. D. C.

OPERARIUS. A manorial tenant who actually worked for his lord on the land at various kinds of agricultural labour, and had not commuted his services for a money payment (see MANUOPERATIONES). In the *Testa de Nevill*, p. 186, the annual services of a

villanus are valued at 8<sup>d.</sup>, but those of a *nativus operarius* at 8s. 4<sup>d.</sup> R. H.

OPIUM, AS A STATE MONOPOLY. Opium, the inspissated juice of the poppy, is produced on a large scale in India, China, and Persia. The opium in common use in Europe for medicinal purposes is as a rule of the so-called Smyrna or Turkey variety, and is obtained mostly from Asia Minor and Persia. That which is produced in India and China is less rich in morphia than the former variety, and is used by many Asiatic races, including the Chinese and the populations of India, as a narcotic and stimulant. It is both eaten and smoked; the latter form of consumption being chiefly, though by no means exclusively, prevalent in China.

Opium is of interest to economists chiefly because, throughout that part of India which is British territory, it is the subject of an extensive state monopoly. This is of considerable antiquity, dating back to a period anterior to the establishment of British rule in India. Under the Mogul empire the trade in opium was an imperial monopoly, and farmed at a quit-rent. Up to the period of the British acquisition of Bengal and Behar, the Dutch were the chief purchasers. Instructions to make opium a part of the investment were first issued by the British East India Company in 1683. During the anarchy which prevailed throughout the decay and fall of the Mogul empire in the middle of the 18th century, the imperial monopoly fell into abeyance; trade was disorganised; cultivation fell off; and the opium produced was so generally adulterated that it yielded very poor prices. Even after the restoration of comparative peace in 1765, disorder continued. At length, in 1773, Warren Hastings, then governor-general of Bengal, assumed on behalf of the East India Company a monopoly of all opium produced in Bengal, Behar, and Orissa, subject to certain concessions secured to the Danes, the Dutch, and the French, which have now either lapsed or been commuted for a money payment.

The rights thus acquired were at first farmed; but in 1797 the direct or "agency" system was introduced, and is still in force. Under this system, as now administered, the cultivation of the poppy plant is generally prohibited throughout British Indian territory. It is permitted, however, in eleven districts of Bengal and twenty-nine districts of the North-Western Provinces under license; the cultivators, who receive periodical advances from government, are bound under penalties to deliver the whole of their crop to the agent at a rate previously fixed. This rate has fluctuated slightly. From 1881-82 to 1893-94 it was Rs. 5 per seer (1 lb. 14 oz. nearly) of 70° consistence, i.e. 70 parts in 100 being pure opium, the remainder being water. It is now Rs. 6 per seer.

The opium delivered to the agents is manufactured at the two state factories, situated at Patna, and at Ghazipur near Benares, into "provision" opium, adapted for export to China, and "excise" opium, for consumption in India. The average cost of a chest (=140½ lbs.) of provision opium has varied during the last ten years from Rs.412 to Rs.449. The same opium, when sold at the government auction for export to China, has realised average prices ranging from Rs.1037 to Rs.1251 per chest. The excess of the sale price over the cost price may be regarded as the duty which the existence of the state monopoly enables the government to impose. This at present exceeds Rs.800 per chest, *i.e.* is not far short of twice the cost price of the drug.

In most of the native states of India poppy cultivation is prohibited. But in an important group, the majority of which are situated in Central India and Rajputana, a large amount of opium—the so-called Malwa opium—is produced. In these states the British government has no concern with the cultivation, manufacture, or sale; but the native rulers levy a variety of imposts, among which is usually included a special rate of land-tax on land suitable for poppy. This opium is not permitted to enter or pass through British territory, for local consumption or export to China, save under passes granted by a British agent, and on payment of a heavy transit or import duty. The rate of duty has varied from time to time, and is now Rs.650 per chest (=140½ lbs.) of 90° consistence. This is equivalent to Rs.527 on opium of the consistence of Bengal opium. The British government is enabled to levy this duty by reason of the fact that the opium cannot reach the sea for export to China without passing through British territory.

The propriety of maintaining the Bengal monopoly has been frequently considered by Indian and other authorities. Regarded from an administrative standpoint, the monopoly system is, it is now generally conceded, superior to any that could be substituted for it. In 1864 it was condemned, on purely economic grounds, by Sir Charles Trevelyan, then Indian finance minister, who held that its abolition would be "attended with the same good effects as the throwing open the India and China trade, and the abolition of the Bengal salt monopoly," *i.e.* by a large expansion of the trade. Such a result would not, at the present day, be ordinarily regarded as favouring the abolition of the opium monopoly. Other authorities, including Sir W. Muir, have attacked the monopoly on the ground that it casts upon government "the odium . . . of not only encouraging the growth of the poppy, but of itself being the direct trafficker in the drug and its monopolist." On the other hand, Sir J. P. Grant, a former lieutenant-governor of Bengal, has maintained

that "the distinction, as a question of ethics, between raising a revenue from opium by an excise on consumption and a duty on exportation, and raising the same revenue by monopolising the manufacture, is fanciful and false." As a measure of finance, the abolition of the monopoly and its replacement by an export duty is easily shown to be disastrous. The state profit on a chest of Bengal opium is over Rs.800, whereas the export duty on a similar chest of Malwa opium is only Rs.527. It follows that if the quantity of opium produced remained the same, there must be an enormous loss of revenue; while if the revenue remained the same, the quantity of opium produced must be very largely increased.

The policy of China in regard to the local production and import of opium has varied from time to time, cultivation and import being alternately prohibited and permitted. It is known that the poppy was extensively cultivated in China, and opium imported from abroad many years before the English became concerned in the trade. It is frequently alleged that the Chinese wars of 1840-42 and 1856-58 were waged in order to compel that country to receive Indian opium. Two of the best authorities, however, Mr. H. N. Lay and Sir Thomas Wade, strenuously deny that this charge has any basis of truth. They affirm that opium was a mere incident of the first war, and had no concern whatever with the second; and that the object of both wars was to compel the Chinese to have political and commercial relations with us. The opium trade became legal after the Treaty of Tientsin (1858). The tariff duty and *likin*, or inland transit duty, are levied together and regulated under the Chefoo Convention (1876).

The Indian opium trade in all its bearings has lately formed the subject of an exhaustive inquiry by a royal commission appointed in 1893. The report states that the evil arising from the use of opium is less than has been represented in England, and that the commissioners have no evidence of extensive moral or physical degradation arising therefrom; that no case has been made out for prohibition, nor could such a measure with justice be extended to the native states; that the Bengal monopoly is the best system for regulating the production of opium in British India; and that the present treaties which govern the admission of opium into China have been deliberately accepted by the Chinese government, and admitted by the latter to contain all that they desire. The finding is, in substance, that unless China should hereafter declare a wish to prohibit import, there are no grounds for interfering either with the export trade, or with the production and local consumption in India.<sup>1</sup>

<sup>1</sup> There still exists, however, in the minds of many persons in England, a strong desire to see the British government in India cease to appear as the manufacturer of an intoxicant; but no corresponding desire has been expressed by them to supply a less objectionable source of revenue to the Indian government, to make up the deficiency.

N. B.

**OPTIMISM.** The term optimism is difficult to define. Strictly it should signify the belief that everything which exists is the best possible. But as there is scarcely any pessimist who denies absolutely the existence of good, so there is scarcely any optimist who denies absolutely the existence of evil. Optimism therefore can describe only the belief that good greatly preponderates in the world, or that evil admits of being resolved ultimately into good. Such a belief may be the result either of temperament or of a process of logical inference. In so far as it is the result of a happy temperament, it cannot be communicated to those whose disposition is less cheerful. In so far as it is the result of logical inference it may take various forms. All who regard the universe as the work of reason, in other words, all theists, must be optimists in one sense or another. But among theists even within the bounds of the Christian church there may be wide differences in the nature of their optimism. Some may concentrate their minds on the corruption of man and others upon the benevolence of his Creator. St. Augustine or Calvin would hardly be termed optimists in the ordinary use of that word. Paley was an optimist in every sense. Now one of the characteristics of the period in which modern political economy took its rise, the period between the close of the Thirty Years' war and the outbreak of the French Revolution, was a general optimism. Religious wars and persecutions had impressed the most active minds with indifference or disgust for the theological views which came down from the middle ages, and which were permeated with distrust of human nature and aversion to the pursuits of the world. In contrast to these views the antique conception of nature kept alive by the Roman law again attracted philosophers and became the germ of new moral and political theories. Natural religion took the place of revelation, and natural goodness of asceticism. Natural instincts were again regarded as innocent and deserving of gratification. Much stress was laid on those amiable and social instincts which find their fulfilment in promoting the happiness of others. Providence, it was held, had so ordered the world that each man in seeking to satisfy his own

desires contributed to the general welfare. Virtue was identified with the rational pursuit of happiness, and thus was made to appear easy and natural. From these first principles the inference in favour of freedom was irresistible. Restraint or compulsion was in itself an evil because it was painful, and in most cases restraint or compulsion was unnecessary, since human instincts harmonised by divine wisdom tended of themselves to bring about the good of mankind.

This form of optimism pervades the discussion of education, of legislation, and of economics by the most celebrated writers of the 18th century. It is very noticeable in the writings of the physiocrats and of Adam Smith. Adam Smith cannot indeed be charged with taking too exalted a view of human nature. He assumes that men are generally employed in promoting their own interests, and he objects to any regulation that can be dispensed with, because he thinks that it is likely to be inspired by selfishness. Adam Smith's optimism lies rather in overrating the ability of the individual to perceive his interest, and in assuming a providential harmony between the self-interest of various individuals if placed in a state of legal freedom and equality. It is only after a prolonged discipline that the ordinary civilised man has attained even to his present imperfect knowledge of what is good for him, and even now the pursuit of his own welfare by each individual constantly brings him into conflict with others.

Since Adam Smith wrote upon morals and economics, optimism has been discouraged by several causes. In the first place, the French Revolution showed that the glorification of natural impulses might end in crimes and disorders as great as had ever been produced by fanaticism. In the next place, the struggle of nation with nation, and of class with class, for the last hundred years, has compelled us to see that there is no pre-established harmony between the appetites of different human beings. In the third place, the rise in the standard of comfort has produced an all but universal discontent. Mankind are probably more comfortable than in any former age, yet the difference between that which they enjoy and that to which they think themselves entitled is more noticeable than ever. Lastly, the progress of science has disturbed the cheery, old-fashioned view of nature. Malthus showed that nature has not provided an abundant subsistence for an indefinite number of persons. Darwin showed the evolution of life to have been a process of almost infinite length involving wholesale waste and destruction. Those who have adopted a formal and philosophical pessimism are few, but those who maintain the easy optimism of the 18th century are fewer. There are many who propose to make mankind

happy by political or economical changes, but as a rule they propose to do this by subjecting the individual to the community. For with the old optimism the old belief in liberty has also declined in strength.

The change in the tone of economic literature may be realised by comparing Smith's *Wealth of Nations* with J. S. Mill's *Principles of Political Economy*. Leslie Stephen, *English Thought in the Eighteenth Century*; Bonar, *Philosophy and Political Economy*; Ritchie, *Natural Law*, may be consulted for information respecting the philosophical optimism of the last century. F. C. M.

**OPTIONS.** An "option" is the right to conclude a bargain on a future date, at a certain price. A "buying option," called also "the call," is the right to demand a certain number of shares, or amount of stock, or quantity of some specified produce, within a given time, at a fixed price; and a "selling option" is the right to sell, or "put" stock shares or produce under the same conditions. A "put and call" is a right of either buying or selling at a fixed price. Upon this plan speculations may on one side be made with a small capital, and with only a certain limited risk. But the net profits of the speculation are diminished by the price given for the option; and the probability of any profit resulting is really very small, because the price demanded is sure to be large enough to cover all the chances which the dealer can foresee.

Options are chiefly dealt in on the Stock Exchange, but are also frequently used in the United States in transactions in wheat and other produce (see **PUT AND CALL**). R. W. B.

**ORA** (Anglo-Saxon). The ora was a money of account introduced into England by the Danes, and does not appear at any time to have been a coin in use in this country.

In the reign of Edward the Elder (901-924), fines imposed upon the English population were reckoned in shillings, while sums due from the Danes were calculated in ora. The Danes used the term to designate both a weight and a cash value. The weight is alluded to in one version of the Laws of Ethelred as one-fifteenth of a pound, and the value is frequently referred to in *DOMESDAY BOOK* (q.v.) as that of twenty shillings. Subsequently, however, record exists of a lower rating of sixteen shillings being also used. The modern Scandinavian *ORE* is doubtless the lineal descendant of this ancient money of account.

[R. Ruding, *Annals of the Coinage of Great Britain*, 1840.] F. E. A.

**ORDER** (bill or note payable to). At common law a bill or note could not be negotiated by indorsement unless it contained words expressly authorising transfer. But § 8 of the Bills of Exchange Act 1882 has adopted the Scotch rule, and now provides that a bill is payable to order which is expressed to be so payable, or which is expressed to be

payable to a particular person, and does not contain words prohibiting transfer, or indicating an intention that it should not be transferable. The result is that if a bill or note is made payable to A. B. it is in legal effect payable to A. B. or his order. The same rule applies to indorsements. M. D. C.

**ORDER AND DISPOSITION.** The ownership of personal property, as a rule, can be transferred by delivery of possession. Possession of property is therefore evidence of ownership. Where a purchaser or a mortgagee of chattels permits them to remain in the possession of the vendor or mortgagor, the latter appears to the world at large as owner, and is therefore able to obtain credit as such. In order to protect creditors, successive bankruptcy acts have made all goods that are in the "possession, order, and disposition" of a bankrupt, in his trade or business, by permission of the owner, and of which the bankrupt is the reputed owner, liable for payment of his debts, even though such goods belong to some one else.

[Robson on *Bankruptcy*, 1894.] J. E. C. M.

**ORDERS IN COUNCIL** (retaliatory against France). The battle of Trafalgar (21st October 1805) annihilated the French fleet, put an end to all schemes for an invasion of England, and secured English supremacy at sea for the remainder of the war. Soon afterwards the battle of Austerlitz (2nd December 1805) broke up the great coalition which Pitt had formed, and gave to France an ascendancy in Europe such as no power had obtained for centuries. From this time the two great belligerents, England and France, unable to strike each other directly, were forced to resort to the destruction of each other's commerce, and began a struggle limited only by their respective powers of endurance. The peculiar difficulty of this warfare against commerce, which now became the main object of both states, lay in the injury which it must necessarily inflict upon neutral powers, whose interests in time of war are always opposed to those of belligerents. Both in 1780 and in 1800 the Baltic states had shown their hostility to any infringement of their trading rights by forming an **ARMED NEUTRALITY** (q.v.). And there was now another neutral power to be reckoned with. The United States had become independent in 1783; since the outbreak of the war they had developed a considerable mercantile marine, and their geographical position gave them peculiar advantages for carrying on trade between the West Indies and Europe. The attitude of the United States becomes a factor of first-rate importance in the relations between England and France after 1805.

England took the first step when the Grenville ministry, which had been formed on Pitt's death, issued an order in council on 16th May 1806. This decreed a general blockade

of the whole coast from the Elbe to Brest, and a rigorous blockade from Ostend to the Seine. No neutral vessels could enter a port on the latter coast, and outside the narrower limits they were only admitted provided they "had not been laden at any port belonging to his Majesty's enemies." This order, which was not for the time an excessive straining of the maritime ascendancy of England, gave Napoleon a pretext for issuing the famous Berlin decree (21st November 1806), which laid the foundation of what is known as the CONTINENTAL SYSTEM (*q.v.*). By this he declared the British Islands to be in a state of blockade, prohibited all trade with them, and decreed that all goods exported from them were lawful prize. This decree, which France would have found it extremely difficult to enforce, provoked the whig ministers to draw up the first of the great orders in council, which was issued on 7th January 1807. This document, which was condemned by the opposition as a very inadequate measure of retaliation, ordered "that no vessel shall be permitted to trade from one port to another, both which ports shall belong to or be in the possession of France or her allies, or shall be so far under their control as that British vessels may not freely trade thereat." This prohibition of the coasting trade went beyond any previous claim of England, which had hitherto aimed mainly at preventing the carriage of goods from French colonies to the mother country. It was bitterly resented by the Americans, who had discovered a lucrative business along the Mediterranean coasts from which they were suddenly excluded under penalty of capture and confiscation.

In March 1807 the Grenville ministry was driven from office and their places were filled by tories, who were more resolutely anti-French and less scrupulous in the choice of expedients. Soon afterwards Napoleon ended the northern war by the treaty of Tilsit (8th July 1807), by the secret articles of which France and Russia pledged themselves to effect the complete exclusion of England from trade with Europe. Napoleon now returned to Paris, and devoted all his energies to the carrying out of his continental system, which he had been compelled to neglect during the campaigns of Eylau and Friedland. Denmark, Portugal, Prussia, Austria, and Turkey were all coerced or induced to prohibit the entrance not only of English vessels but of all English products. French ships were instructed to seize the vessels of any power if they carried any goods of British origin, and French courts were instructed to declare the cargoes of such vessels to be lawful prize.

These vigorous measures gave the tories a pretext for that energetic retaliation which they had demanded when in opposition. On 11th November 1807 they issued another order in

council which asserted that the "order of 7th January has not answered the desired purpose, either of compelling the enemy to recall his orders or of inducing neutral nations to interfere with effect to obtain their revocation, but, on the contrary, the same have recently been enforced with extreme rigour." The main provision of the order is that "all the ports and places of France and her allies, or of any country at war with his Majesty, and all other ports or places from which, although not at war with his Majesty, the British flag is excluded, and all ports or places in the colonies belonging to his Majesty's enemies, shall from henceforth be subject to the same restrictions in point of trade and navigation as if the same were actually blockaded by his Majesty's naval forces in the most strict and rigorous manner." Further "all trade in articles which are of the produce or manufacture of the said countries or colonies shall be deemed and condemned to be unlawful, and every vessel trading from or to the said countries or colonies, together with all goods or merchandise on board, and all articles of the produce or manufacture of the said countries or colonies, shall be captured and condemned as prize to the captors." This is obviously the direct and complete reply to the Berlin decree, and though the scope of the English prohibition is the more vast and comprehensive in proportion to the magnitude and number of her enemies, yet this difference was by no means out of proportion to the differing naval power of the two countries. The French men-of-war were closely confined to their harbours, so that the blockade of the British islands was purely verbal. England, on the other hand, though of course unable to enforce a blockade on the scale of the order, had such an overwhelming naval force at sea as to make the prohibited trade extremely difficult and dangerous.

To the sweeping prohibitions of its main clause, the order of 11th November made two important exceptions in favour of *bona fide* neutrals: (1) they might trade to or from the colonies of hostile powers provided their port of departure or destination was in their own country or in a British colony: (2) they might clear out from some British port, or from Gibraltar or Malta, or from the port of an allied state, to any hostile port, or back from such port to a British or allied port, so long as the hostile port were not actually blockaded by the fleet. In these exceptions, and especially in the second, lies the subtlety of the English policy of retaliation. Napoleon had prohibited the exportation of goods from the British Islands; the English government replied that France and her allies should not receive any goods whatever except from the British islands, and no goods were to leave France unless in the first place they went to Britain. Thus

not only was France to be weakened and humiliated, but all her imports and exports were to pay toll to the enemy, who would use the wealth thus obtained in strengthening her own forces and in subsidising the continental enemies of France. Napoleon was not slow to reply to a measure which was as insulting as it was damaging to his subjects and allies. On 17th December 1807 the Milan decree declared that every ship which suffered the search of an English vessel, or submitted to a voyage to England, or paid any tax to the English government, was by that act denationalised and deprived of the guarantee of her flag. Any ship, whatever its nationality or its cargo, was declared to be lawful prize if it was on its way to or from Britain, British colonies, or places occupied by British troops.

By these measures the two belligerents stood committed to a struggle for life or death, and also to a policy which imposed greater loss and restrictions upon neutral powers than the latter had undergone in any previous war. For Europe this was a small matter, as Napoleon would not allow any neutrals within reach of his military forces. The United States were the chief sufferers; and they hastened to retaliate by closing their market to both the belligerent powers, and by depriving both of the benefit of American goods and carriers. An act of embargo (22nd December 1807) forbade American vessels to leave their ports except for another port in their own country. When this was repealed on 1st March 1809, it was succeeded by a non-intercourse act which prohibited all trade with Great Britain, France, and their respective colonies.

The policy and the morality both of the French decrees and of the English orders were hotly debated at the time, and have been a subject of much subsequent discussion. As regards morals, the measures were essentially military in character, and can be justified only on the grounds of advantage or necessity. From the point of view of policy, there can be little doubt that Napoleon's conduct was ill-considered and reckless, and the result justified England in imposing temporary hardship on herself, and in incurring the hostility of neutral states, in order to secure an ultimate victory. France, absolutely unable to defend her own shipping, was really dependent for important supplies upon neutral carriers, and ought to have done all in her power to aid and encourage them. Moreover the hardships imposed upon Europe by the exclusion of necessities, or by the enormous increase of their price, raised a spirit of resistance to French domination, as an intolerable burden, which even Napoleon could not quell. The necessity of forcing reluctant subjects and allies to carry out measures which he deemed necessary for the destruction of his inveterate opponent compelled him to undertake

those enterprises in the Peninsula and in Russia which first sapped and then overthrew his power.

One of the most curious features of the great struggle, which began in 1807 and practically ended in 1812, was that neither state could afford strictly to enforce its own decrees. England was determined to force its manufactures upon Europe in spite of Napoleon, and was aided in doing this by the reluctance of the northern states to obey the orders received from Paris. To facilitate the vast smuggling trade which went on on the coasts of the Baltic and North Sea, England resorted to a system of licenses by which merchants were allowed to carry on trade prohibited by the orders without running the risk of capture by English cruisers. From 2006 in 1807 these licenses increased to over 15,000 in 1809 and over 18,000 in 1810. Napoleon, on his side, found it impossible to dispense with the supplies which his decrees prohibited, and large sums were made by the French government by selling licenses. During the war with Austria in 1809 the evasion of the continental system was so general that its results were mainly seen in the height of prices and the heavy charges for marine insurance. England was so much the gainer by this relaxation that she endeavoured to conciliate the United States by a third order in council (26th April 1809), which narrowed the general blockade ordered in November 1807 to the coasts of Holland, France, and the Italian kingdom of Napoleon.

After his victory at Wagram (6th July 1809), and the conclusion of peace with Austria, Napoleon returned to France determined to draw tighter than ever the restrictions which the recent war had allowed to slacken. If he was powerless at sea, he was absolute on land, and instead of sending his veteran troops to Spain, where they might have ended the war, he employed them as a gigantic coast-guard along the northern and western coasts of Europe. As Holland had proved recalcitrant under his brother Louis, the latter was deposed and his kingdom annexed to the French empire. Other annexations, including the duchy of Oldenburg, followed, until the cordon of troops was complete from France to Russia. When all preparations were made, Napoleon issued a decree of Fontainebleau (19th October 1810), by which all English merchandise in the countries dominated by France was to be taken and burnt. This edict was ruthlessly carried out by the French soldiery.

Now for the first time England felt the full strain of the continental system. Licenses became useless when the exported goods were liable to prompt seizure and destruction; and their number fell from 18,000 in 1810 to 7500 in 1811. It was calculated that "60,000 tons of coffee lay in the London warehouses, unsaleable at sixpence the pound, while the price or

the continent was from four to five shillings, and in some places even seven shillings." The closure of the American market and a series of bad seasons made matters worse, and the general depression resulted in the bankruptcy of many firms. The orders in council, which had been popular at first, were now objects of general detestation. The opposition denounced them in parliament, the great towns petitioned for their repeal, and the United States threatened war. The government could hardly hold out for long against the general clamour. Fortunately the strain was relaxed at the moment when it seemed to have reached the stage of cracking. The sufferings of France had been even greater than those of England, and she had far less capacity of endurance. The resources of credit taxation and conscription were alike exhausted by the demands which the emperor had made upon them. At this moment the chief French ally found it necessary to make a change of front. Russia was peculiarly dependent upon the English market for its produce, and Alexander I. refused to bring material ruin on his subjects as well as to endure the personal slights put upon him by Napoleon. In December 1810 he struck the first blow at the agreement of Tilsit by allowing neutrals to import to Russia a number of articles of British manufacture. In 1811 Russia abandoned the French system altogether, and entered into negotiations with England and Sweden. Napoleon had no alternative but to acknowledge defeat or to compel submission to his will. He chose the latter alternative, and in 1812 he started on that eastern campaign which led directly to his downfall. In the same year Wellington began the brilliant series of aggressive campaigns which ended in the expulsion of the French from the Peninsula. The warfare against commerce had ended in the defeat of France, and the orders in council had done their work. On 23rd June 1812 the orders of 1807 and 1809 were formally repealed. Unfortunately the repeal came too late to avoid a rupture with the United States, which had declared war against England on 18th June.

[See articles on CONTINENTAL SYSTEM; LICENSES (Continental War), and authorities there referred to. For fullest and best account of the warfare against commerce see Mahan, *The influence of Sea Power upon the French Revolution and Empire* (1892), vol. ii. chs. 17 and 18. It is noteworthy that Captain Mahan, though an American, approves on the whole of the policy of the orders in council.]

R. L.

ÖRE. By the provisions of the Scandinavian monetary convention of 1872 the standard of value in Sweden, Norway, and Denmark, the CROWN (*q. v.*), value 1s. 1'215d., is divided into 100 öre.

Token silver coins of fifty, forty, twenty-five, and ten öre are in circulation.

F. E. A.

ORESME, NICHOLAS (c. 1320-1382), the author of a treatise on the currency, was one of the most distinguished of the French scholars of the 14th century. In 1356 he became grand master of the College of Navarre at Paris; in 1361 he was elected dean of the church of Rouen; and in 1377 he was appointed Bishop of Lisieux. Without deserving a place in the line of great schoolmen, he was a man of interests as wide as the science of the time, and wrote upon many subjects with facility and force. In 1363 he preached before pope Urban V. at Avignon a vigorous sermon, on the evils in the church, which was in great repute towards the end of the middle ages, and was several times reprinted during the reformation. In 1370 he translated the *Ethics* of Aristotle from Latin into French at the request of Charles V., and was appointed in recompense one of the royal chaplains; and in 1371, at the same prompting, he translated the *Politics* and *Economics*. One at least of his theological works enjoyed a high reputation in the schools of Paris; and his numerous writings on mathematics deserve recognition in the history of that science. The date of the composition of his *Tractatus de Origine, Natura, Jure, et Mutationibus Monetarum* is unknown, but it was probably toward the middle or end of the reign of John II. (1350-1364); the translation into French, which was made by Oresme himself, appears from internal evidence to have been made after 1356.

[The data for the life of Oresme have been carefully gathered by F. Meunier, *Essai sur la vie et les ouvrages de Nicole Oresme* (Paris, 1857), where will be found a list both of his undoubted and dubious works with some illustrative excerpts. Meunier shows that there is no evidence for the assertion, in itself difficult to reconcile with chronology, that Oresme was the preceptor of Charles V. of France. For his mathematical writings, see M. Curtze, *Die math. Schriften des Nicolaus Oresmius* (Berlin, 1870).

His *Tractatus de Origine, etc.*, *Monetarum* occupies some thirty octavo pages. It is composed of twenty-six brief chapters and a prologue. In the prologue he states that some are of opinion that the prince has a right to change the currency at pleasure, and make profit thereby. His intention, accordingly, is to set down what seems to him most necessary to be said according to the philosophy of Aristotle; and his hope is to bring about a common agreement. He begins by explaining the invention of money (ch. i.); the use for that purpose of the precious metals (ch. ii.); the use of more than one metal and of alloy for the smaller values (ch. iii.); and the necessity for a stamp (ch. iv.). Since money is instituted for the good of the community, it ought to be coined by "a public person"; and as the prince is "a person more public" than any other individual, he alone ought to undertake the work (ch. v.). This, however, does not make the prince "the lord or proprietor of the currency" (ch. vi.).

The expense of coinage is best met by a proper seigniorage (ch. vii.). The discussion of the main theme then opens with the general proposition that laws or customs affecting the community, including therein the currency, are never to be changed without evident necessity; and this is especially the case with money, on account of the common practice of fixed rents, etc. (ch. viii.). An alteration of the stamp may be sometimes desirable (ch. ix.), and also of the ratio of exchange between the metals, when any notable change takes place in their relative value as commodities ("Verumtamen ista proportio debet sequi naturalem habitudinem auri ad argentum in pretiositate": ch. x.). A change in the denomination of coins is only justified on such exceedingly rare occasions as not to be worth considering (ch. xi.). A change in the weight without a change of denomination is absolutely wrong and fraudulent (ch. xii.); and the same is true of a debasement of the material (c. xiii.); in both these ways the prince unduly draws to himself the substance of his people. The gain to the prince from the alteration of the currency is unjust (ch. xv.), unnatural (ch. xvi.), worse than usury (ch. xvii.), and such evils are of their very nature intolerable (ch. xviii.). Debasement of the currency involves much dishonourable embarrassment to the prince (ch. xix.); impoverishes the subjects, leads to the withdrawal of the precious metals from the country, and disturbs trade (ch. xx.); it benefits chiefly those who follow base occupations, such as money-dealers; and in divers ways it demoralises the people (ch. xxi.). It might seem that as the currency belongs to the community, the community has a right to raise money by an alteration of the currency, especially as such a method satisfied "quasi omnes bonas conditiones requisitas in aliqua tallia" (which are much the same as Adam Smith's canons of taxation). But unless the need of money is very great and the sum raised is to be expended in a far country, so many evils will follow therefrom that to do so will be an abuse of power (ch. xxii.). The prince cannot plead necessity or the grant of the community; the necessity of the community itself should decide, and the community cannot transfer its rights (ch. xxiii. xxiv.). A tyrant cannot long endure (ch. xxv.); and to make gain from a debasement of the currency is prejudicial to the royal power itself (ch. xxvi.).

The reputation of Oresme among modern economists is chiefly due to the enthusiastic praise of W. Roscher in his paper "Un grand économiste français du xiv. siècle" in *Comptes Rendus de l'Acad. des Sc. morales et politiques* (1862). This led L. WOLOWSKI to bring out an edition of the treatise in both its Latin and French forms, with an introduction, in 1864. Ten years later ROSCHER described Oresme as "the greatest economist among the scholastic writers, for two reasons: first, the truth of his views, and secondly, his freedom from pseudo-theological system and pseudo-philosophical argumentation" (*Gesch. der N. O.*, p. 25). Professor Cunningham has more recently spoken of Oresme as the earliest economic writer to explicitly adopt national wealth and national power as the very basis of his argument

(*Growth of English Industry and Commerce*, i. (1890), 322), and has reprinted the *Tractatus* as an appendix to his history.

On the other hand, as early as 1863 W. Endemann (*Die nationalökonomischen Grundsätze der canonistischen Lehre*, 1863, in HILDEBRAND'S *Jahrbücher*, i., and separate; n. 331) declared that Roscher's "discovery" only showed how ignorant economists were of the older juristic literature; that the tractate was neither a "source" for later times, nor anything wonderful for its own; and that the ideas were not at all original, but taken from Azo and Accursius and the glossators. In his *Studien in der romanisch-kanonistischen Wirtschafts- und Rechtslehre*, ii. pp. 164-189, (1883), Endemann returns to the charge, and asserts that Oresme's ideas were essentially the same as those of Aquinas and many who followed him, and that there is no reason whatever to regard him as an economic writer of the first rank.

It were unwise to attempt a final judgment until the literature of the 14th century has been more carefully examined. It seems, however, clear that Oresme's general ideas were common to the theologians, canonists, or legists of his time; it is probable also that the special feature of his argument, the insistence upon the right of the community to control the currency, was common to him with other representatives of the constitutional party in France. The currency had been again and again debased during the century; the states-general had repeatedly protested against such measures, and demanded that the currency should be restored to purity, e.g. in the *Grande Ordonnance* of 1357. These considerations need not, however, prevent our recognising the vigour and (on the whole) the clearness of Oresme's tractate, and the courage which was probably required for so unmistakable a declaration. It is not impossible that the treatise was itself composed during the constitutional agitation of the years 1355-1357: Oresme was then residing at Paris, where the states-general assembled; and we know that on the general subject of taxation he agreed with the constitutional party. If this be so, Oresme's place is not in the history of the theory of currency, but in the history of the theory of constitutional government.] W. J. A.

ORGANISATION OF INDUSTRY. See INDUSTRY, ORGANISATION OF.

ORTES, GIAMMARIA (1713-1790), a Venetian monk, left his cloister on the entreaties of his mother after his father's death, but remained in holy orders and was ever a strenuous defender of the clergy. It is with this purpose that he wrote his *Errori popolari intorno all'Economia nazionale*, his *Lettere sulla Religione* and his treatise *Dei Fide-commessi a famiglia e a chiese*, with the scope of upholding the existence of clerical property in mortmain.

In his *Economia Nazionale* (vols. xxi. xxii. and xxiii. of *Custodi's Scrittori classici italiani di Economia Politica*, Milan, 1802-1816) Ortes endeavours to demonstrate that as "the wealth of a nation is determined by the (previous) wants of its members, the riches of one of them

cannot increase unless at the expense of another one; the bulk of existing riches is in each nation measured by its wants, and cannot by any means whatever exceed this measure" (*Discorso Preliminare*). From this rather startling proposition, Ortes, who certainly was an original thinker, deduces the condemnation of the principles on which mercantilism was based. "Money is only a sign of wealth, and must never be considered as being wealth itself. The error of those who mistake money for wealth, proceeds from a confusion between the equivalent of a thing and the thing itself, or between two equivalents which they consider as identical things, although they are not" (ch. ix.).

In his *Riflessioni sulla Popolazione* (Venice, 1790, and vol. xxiv. of *Custodi*) Ortes controverts the prevailing opinion that an increase of population must necessarily increase the wealth of a nation, and maintains that "in any nation whatever the population is compelled to keep within fixed limits, which are invariably determined by the necessity of providing for its subsistence" (*Prefazione*). In his very first chapter he asserts that, if natural instincts were allowed full play, population would increase in a geometrical progression (doubling every 30 years), and calculates that a group of 7 persons composed of three old people, two young men and two young women of 20, would be the ancestors at the end of

150 years of	224 living persons
300 "	7,168 "
450 "	229,376 "
900 "	7,516,192,768 "

Sheer violence keeps down the numbers of animals within the necessary limits, but among men, "generation is limited by reason" (ch. iii.), especially by voluntary celibacy, which affords Ortes an occasion of extolling the provident discipline of the Roman Catholic church. Ortes is a harbinger of MALTHUS; first by his law of the geometrical increase of population, and secondly by the influence which he ascribes to human reason as a prudential check against over-population.

Ortes was a fervent mathematical student, and expresses himself in algebraical formulæ in his *Calcolo sopra il Valore delle Opinioni umane* (vol. xxiv. *Custodi*). In the same work he illustrates his meaning by curves, which, if not actually traced, are at least minutely described.

[See also Lampertico's monograph of *Grammatica Ortes e la Scienza Economica al suo tempo*, 1865. A very complete analysis of his writings in Professor Errera's *Storia dell'Econ. Pol. nella Repubblica Veneta* (Venice, 1877, pp. 92-156), and especially for his decided views in favour of free trade, Gobbi, *La Concorrenza Estera e gli antichi Economisti Italiani* (Milan, 1884), pp. 197-202.]

E. ca.

Ortes is undoubtedly the most eminent of the

Venetian economists of the last century; his genius—original and sometimes paradoxical, is often opposed to the general tendency of the ideas of his time, and though his researches are occasionally faulty in their method, he has left a deep impress on the history of economic theory. He regards economic laws as immutable, like those of nature; he maintains this in opposition to the opinion usually accepted in his time, which regarded economics only in relation to special interests. Perhaps it is this idea which leads him to distrust the action of the state, considering it not adapted to promote the wealth of a country.

While Ortes applied a mathematical method to economics, his arguments are based throughout on abstract theory, disregarding the study both of facts and of history as not appertaining to economic science. This detracts from the value of his labours. Still his works are of weight in the history of economic theory. He did not adopt the doctrines of the PHYSIOCRATS, and he also recognises the importance of division of labour, and the important place taken by production in economic theory. Contrary to the prevailing ideas of his day, Ortes upholds universal free exchange.

ORTHODOX ECONOMISTS. A title sometimes applied to those writers known as the CLASSICAL ECONOMISTS (*q.v.*). This description appears preferable. Orthodox is a term suggestive of controversy, and of the existence of an ascertained norm—a frame of mind uncongenial with that calm spirit in which economic questions should be approached.

ORTIZ, JOSÉ ALONSO (second half of the 18th century), published in 1794 a Spanish translation (with notes) of Adam Smith's *Essay on the Wealth of Nations*, under the title of *Investigación de la Naturaleza y Causas de la Riqueza de las Naciones* (Valladolid, 4 vols.). Two years later he printed an essay on paper money and public credit (*Ensayo económico sobre el sistema de la moneda papel y sobre el crédito público*, Madrid, 1796), in which, according to Colmeiro's *Bibl. de Economistas Españoles*, he follows closely the theories of Smith. E. ca.

ORTIZ, LUIS (second half of the 18th century), accountant (*contador*) of Castile, published in 1558 a *Memorial al Rey para que no salgan dineros de estos reinos de España* (Memorial to the King to prevent the export of Money from the Kingdom). Although Ortiz is imbued with the notions of his times on the usefulness of the craft organisations and sumptuary laws, the extraction of precious metals, etc., he is praised by Don Manuel Colmeiro (*Bibl. de los Econ. Españ.*) for his temperate views, rather favourable to protection than to absolute prohibition, and for his practical insight into the causes of the Spanish decay during this period. E. ca.

OSCAR I. (1799-1859), king of Sweden, a son of Bernadotte, endeavoured to bring the system of criminal law of his country into accordance with modern ideas.

With this object he wrote, on the punishment of criminals, a book published in German under the title of *Ueber Strafe und Strafanstalten*.

[*Dictionnaire de l'Économie Politique*, Paris, 1864.]

OUNCE (COIN). The money of account of Morocco is the ounce.

The following is a list of the coins in circulation in that country :

Denomination.	Weight. Grains.	Fine- ness.	Value at 5s. 6d. per ounce.
Silver—Ten ounces	285·80	900	5s. 0d.
Five ounces	192·90	835	2s. 4d.
Two-and-half ounces	96·45	835	1s. 2d.
Ounce	38·58	835	5½d.
Half-ounce	19·29	835	2½d.

OUT-DOOR RELIEF. See POOR LAW.

OUTLAW. If a person formally charged with an offence by an indictment is not in custody and cannot be found, he may be outlawed, *i.e.* put out of the protection of the law. The practical results are that he becomes incapable of taking the benefit of the law, and his property is forfeited to the crown. In England outlawry was abolished in civil cases by 42 & 43 Vict. c. 59, and has fallen into disuse in criminal cases, but in Scotland the absence of the prisoner on the day on which he is summoned to appear and stand his trial is always followed by sentence of outlawry.

[Stephen's *Commentaries*, bk. vi. c. xv. As regards outlawry in Scotland, see Bell's *Digest of the Law of Scotland*, Edinburgh, 1890.] J. E. C. M.

OUVRARD, G. J. (1770-1846), a Napoleon in the field of finance, started his fortune in 1789 by anticipating the demand for paper that would follow the enactment of the freedom of the press. He further amassed great wealth by contracts for provisioning the French armies, and on one occasion we find him making a treaty with the king of Spain as though a sovereign power. He quarrelled successively with the government of Napoleon and that of the Restoration, and was imprisoned at least four times. Neither Napoleon, however, nor the Restoration government could dispense with his help. He wrote in prison three volumes of memoirs, *Mémoires de G. J. Ouvrard sur sa vie et ses diverses opérations financières*, Paris, 1827, 8vo. He was a severe critic of Napoleon's system of leaving to the invaded country the finding food for his armies, and offered an elaborate plan of his own before the Russian campaign. In addition to these memoirs, he

was the author of various financial pamphlets. He severely criticised Napoleon's neglect of credit, and was a fervent believer in the expediency of national debts, when safeguarded by sinking funds.

[See his memoirs as above, and *Dictionnaire de l'économie politique*, Paris, 1858.] H. E. E.

OVER-PRODUCTION has been supposed to exist both with respect to consumable commodities and capital. But "the theory of general over-production is an absurdity" (J. S. MILL), in the obvious sense which would justify the recommendation to increase unproductive consumption or to diminish saving.

There are, however, some phenomena which partially resemble the description which is given of over-production. For instance, in a commercial crisis, when there is a deficiency of ready money, there seems to be a plethora of goods; as J. S. Mill has pointed out (Essay 2, *Some Unsettled Questions*). A similar appearance, as he observed, may be produced by a derangement of currency; and it may be added by an appreciation of money consequent upon a great increase in production. Those who suffer from having to meet fixed charges with shrinking incomes are apt to complain of over-production. In general, improvement in production, when accompanied with "sudden changes in the channels of trade" (Ricardo), causes loss to some classes of producers. Workmen may be displaced by machinery (RICARDO, *Pol. Econ.*, ch. xxxi., MILL, *Pol. Econ.*, I. ch. vi. § 2); the native workman by the foreigner (SINGWICK, *Pol. Econ.*, III. ch. v. § 4). These phenomena, if they occurred on a large scale, might present the appearance of general over-production.

The impossibility of a "general glut" has been demonstrated by almost all the authoritative writers of this century; with particular clearness by J. MILL, J. B. SAY, and J. S. MILL. On the other side are the weighty names of MALTHUS, CHALMERS, and SISMONDI; followed by a crowd of inferior writers. Some edification is no doubt to be derived from examining these writings, and in Mill's phrase (*Essays, loc. cit.*), "seeing that no scattered particles of important truth are buried and lost in the ruins of exploded error."

**OVERSEERS (OF THE POOR).** A parochial office created in 1601 by the poor law of Elizabeth (43 Eliz. c. 2). Under that act the parish was made the area for poor relief, and the overseers of the poor were to act along with the church-wardens in the administration. They were to be from two to four in number, and to be appointed by the justices of the peace. Later acts gave power to appoint a single overseer in small places. Where there were no church-wardens the overseers acted by themselves. They were to be good and substantial householders. Women were eligible. If there was no inhabitant fit for the office, an inhabitant of a neighbouring parish might be appointed with his consent and at a salary. Vestries had power to elect a paid assistant overseer. So long as the administration of poor relief was parochial, the office of overseer was highly important. Since the passing of the new poor law of 1834 the overseers have little to do beyond levying the poor rate and making out the lists of persons liable to serve on juries or entitled to the parliamentary or municipal franchise. For the changes affecting overseers in rural parishes made by the Local Government Act 1894, see **PARISH**.

[See *Report of Poor-Law Commission*, 1834.—Eden, *History of the Poor Law*.—Wright and Hobhouse, *Local Government and Taxation*.]

**OVERSTONE, LORD.** See **LOYD**, S. J.

**OVERT-MARKET.** See **MARKET OVERT**.

**OWEN, ROBERT (1771-1858)**, was born at Newton, Montgomeryshire. His father was saddler, ironmonger, and post-master. Between 1781 and 1790 he was assistant to an old-

fashioned Stamford ex-pedlar and linen-draper, M'Guffog; then to Messrs. Flint and Palmer of Ludgate Hill, shopkeepers of the new school, who often worked their employees from 8 A.M. to 2 A.M. Next we find him in Manchester earning £40 a year, at Satterfield's; then setting up for himself without capital, without knowledge of machinery, with an equally inexperienced and indigent partner, in the business of making spinning mules. In 1790 he became manager to Drinkwater, one of the earliest cotton-mill owners at Manchester, with £300 a year, a prospect of partnership, and 500 men under him. In this capacity, he was the first person to spin North American cotton on rollers (1791). In 1794 or 1795 he threw up Drinkwater's employment, and started the Chorlton cotton twist factory. While on a commercial visit to Glasgow in connection with this business, he met Miss Dale, daughter of Dr. Dale, proprietor of New Lanark. She told him that New Lanark was for sale; he went to her father, and bought it at £60,000 for himself and his partners (1797). In the same year he married Miss Dale. It was not until 1st January 1800 that he "entered on the government" (that was his phrase) of New Lanark. The description of New Lanark during Mr. Dale's régime (1784-1800) is derived from Robert Owen's autobiography (1857), his *New View of Society* (bk. i. ii., 1813), and Dr. Macnab, who, in 1819, examined and confirmed Robert Owen's statements in his report to the Duke of Kent. This description was subjected to the most searching criticism at the time by streams of visitors, including the future Emperor Nicholas, Lord Stowell, and others; and was never doubted until Mr. Packard, in 1866, published in his life of Owen an anonymous letter saying that, in 1796, the children were never overworked, that there was no crime and no punishment.

Robert Owen's and Macnab's accounts are as follows:—In 1784, Dale set up one spinning-mill near the Falls of the Clyde. In 1786 work began. He could not get any one to come and work; so he imported 500 workhouse or charity children, whom he fed, clothed, and educated. He took them at six or seven years of age, and worked them from 6 A.M. to 7 P.M.; so that education (say for half-an-hour), began after 7 P.M. Many children, after seven or eight years of apprenticeship, ran away. Further, he got some grown-up people together and built a village of one-roomed cottages with dunghills in front of each (see *Rob. Owen, by a Former Teacher*, 1839). These grown-up people turned out to be thieves, drunkards, and criminals of every sort, as respectable people would not take to manufacture. In 1797 there were four mills at work, and about 700 children and 1000 adults employed; and Mr. Dale, who presided over a bank at Glasgow, over forty

chapels, and over cotton-manufactures all over Scotland, used to spend a few hours every three months, but no more, in New Lanark.

The plan upon which Owen worked was twofold :

*First*, as to the children. He took no more children from workhouses, and allowed no child under ten to work. He established a normal working-day for children, and adults, of ten-and-a-half hours exclusive, twelve hours inclusive of meals (Macnab, 111). His method of education was borrowed from Bell, whose pamphlet on education was published in 1797, and Lancaster, whose schools were started in 1798, each of whom he had assisted with £500 and £1000 respectively. But he borrowed their method with improvements. Both Lancaster and Bell tried, like Owen, to make instruction mutual and recreative. Owen went further, and abolished rewards and punishments, and his teachers taught their pupils by precept and example "to make one another happy." All taught from objects and observation. Owen, however, although he kept at his own expense a clergyman on the establishment, and allowed Bible reading and Sunday schools, excluded theological instruction from the compulsory curriculum. Drill was instituted for boys, domestic economy for girls, singing and dancing for boys and girls. Further, he extended instruction to infants of two years, then at their mothers' request to infants of one year of age—this project (1809) was only completed in 1816; and these, the first infant schools in the united kingdom, were the models of the first English infant schools set up by Lord Brougham and others in 1819 (Hansard, third series, vol. xxvii. p. 1309; *New Moral World*, vol. i. p. 11). Owen believed they were the first in Europe. But Oberlin started schools for infants of two or three years old at Ban de la Roche, apparently at the end of last century (*Memoirs of Oberlin*, p. 87). Owen continued education up till twelve years of age. The expense of education was 3s. per annum per child, paid by the parents, and £700 per annum paid by the employer (R. D. Owen's *Education at New Lanark*, 1824).

*Secondly*, Owen declared that healthy surroundings were as necessary to the character of adults as to the character of children. He wrote: "In pity to suffering humanity either keep the poor in the state of the most abject ignorance, or at once determine to form them into rational beings, into useful and effective members of the state." Institutions must be adapted to perfect the manufacturing community as a whole, not merely the immature portion of it. First, in order to extirpate theft, he put before each worker "a silent monitor"—a small patch of coloured wood symbolising the black, shady, or white character of the worker; e.g. if black, it meant that the worker

had committed theft which Owen by some system of his own had discovered. A register of character was kept. Then, night watchmen paraded the streets to take down the names of drunkards; three bad cases of drunkenness incurring dismissal (R. D. Owen). Drink-shops were gradually abolished, and in 1819 had long been extinct. Again, an elected committee, nicknamed by the housewives "bug-hunters," inspected domestic cleanliness once a week. Then illicit intercourse was fined; fines being paid to "the support fund," and not more than twenty-eight illegitimate children were born there in nine years (Macnab's *Report*, p. 110). The support fund for sick and old, and those injured by accident, was subscribed to by all the workmen, who had to set apart  $\frac{1}{10}$ th of their wages—although their wages were considered by the Leeds committee of 1819 low, 9s. 11d. a week for men, 6s. a week for women. Voluntary thrift was also encouraged in two ways: special residences were set apart for those who laid by money; and a savings bank started, which in August 1819 had £3198 deposits, the population being 2481 in number. There was also a common store. Owen bought wholesale and resold at moderate profits to his workpeople, thereby underselling the former shopmen by 20 or 25 per cent, and substituting good for bad goods. This method killed the dram-shops and every other shop in the place. Further, in 1812 (see *Statement*) he projected a common kitchen "in order to save his men some £4000 a year" wasted on separate fires, cooking, etc. The kitchen dropped out of sight, and was not quite ready on 26th March 1819 (see Dr. Griscom's *Travels*, ii. 384). The effect of these arrangements was that none of the workmen were convicted of crime between 1808 (Hansard, 41, 1203) or 1804 (Macnab) and 1819. Nor according to the *Former Teacher* did Owen dismiss wrong-doers or opponents. R. D. Owen's statement as to drunkards being dismissed indicates an exception to this rule.

But these arrangements could not be carried out except in a building which should focus and be set apart for the common needs of everyday life. The projection of this "New Institute for the Formation of Character" in 1809 had frightened his old partners away, and created such hostility in his new partners that in 1813 Owen went to London to find new partners, published the first two essays of his *New View of Society* (all four essays were at first sent to every government, religious minister, etc., in 1814, and were only issued to the general public in 1816), became acquainted with the leading men of the day, and finally returned to buy in New Lanark, at a cost of £114,000, for himself, BENTHAM, Walker, J. Foster, W. Allen, J. Fox, and Michael Gibbs. The name of the institute embodied what Hazlitt called Owen's "fixed idea"—the idea which first struck him when

on his Highland tour in 1802—that “circumstances” form character. Buying cheap and selling dear, are “circumstances” which deteriorate character; they must be counteracted by some “circumstance” which brings peace, unity, and intelligence. Ties between master and man were loosened by factory labour; some new bond must be forged. The factory system was necessary, because “it is the interest of society to ensure the creation of riches with the maximum of comfort to the producer” (*Address to Powers at Aachen*, 1818), and because it was too late to go back; but it had evils, and one evil was that labour was “depreciated” by excessive competition between labourer and labourer, and, as he afterwards wrote, machinery and labourers; this evil must be met by tackling the question “how the excess of riches may be generally distributed throughout society advantageously for it” (*ib.*); and by pushing forward institutions able to raise and reunite those whom the new productive mechanism had sundered and coarsened. Hence the institute with its lectures, dances, libraries, and other instruments of rational recreation. It was the complement of the factory, and answered the character-wants which factories created. Owen advocated an ideal—a word which by the way he does not use—but an ideal in which profit is an ingredient. Griscom found the partners drawing 12½ per cent profit in 1819. Owen preached philanthropy, but not that of the Duc de LA ROCHEFOUCAULD, whom he saw in France making cotton 4 per cent dearer than his own; philanthropy and a minimum of 5 per cent was to him the Law and the Prophets. This was the double bait which hooked Bentham and the Quakers, Walker, Allen, and Foster. Owen’s ideal was imposed on the employees from without, and did not grow from within. But it won its way with them by persuasion, not coercion. The *Teacher’s* stories of Owen’s forgiveness and tolerance are conclusive on this point. Again, in 1806, when cotton imports were stopped, he paid his unemployed employees full wages, and wished to go under if they went under. As it was he only lost £7000. Again, he always foresaw that a patriarchal system of industrial government must lead to industrial self-government, and that his measures introduced “a more just equality of our race,” and therefore, he said, the Duke of Kent stuck to him till the last, and men like Lord LAUDERDALE fell away from him. In spite of this, he never took any step to substitute the delegates for the patron at New Lanark. But then, he would have answered, “New Lanark is but a half-way house, a compromise, a second best.” He had other schemes brewing. The following are two notices of the condition of New Lanark after 1828, when the opposition of his Quaker partners to his religious views forced him to retire from the firm; (1) from the *Glasgow Free*

*Press* cited in the *Crisis*, iii. 29, which alleged that the “ornamental parts” of education had been dropped, but that dancing and singing were still taught (1833). (2) From R. Owen’s “Address to Infant School Societies” in 1830, which praised the school for its elder children, but alleged that the rational infant school was no more. New Lanark seemed to be forgotten, except as a school for children.

R. Owen’s further schemes may be considered under two heads:

(1) First came the tentative state socialism defined by the *New View*. Abolish state lotteries; allow licenses to sell drink to fall in without being renewed; set up national education under a department which will soon be of primary importance in the state, because that state is best governed whose members are best educated. Collect labour statistics, including the price of labour and the number of the unemployed, and keep some useful work on hand (*e.g.* on roads and canals), as a reserve for the unemployed; who if employed on these works should receive less than the market rate of wages. He was the earliest advocate, in January 1815, of the original Factory Bill, introduced by the first Sir R. Peel later on in that year. His pamphlet on the bill (1815) claims the entire credit of it. Both pamphlet and bill advocate the New Lanark day of ten-and-a-half hours exclusive, twelve hours inclusive, work, and the prohibition of children-workers under ten. The bill, not the pamphlet, limits the normal working day to young persons under eighteen, the pamphlet adding that this would practically involve all the workers in its scope; the pamphlet, not the bill, prescribes an educational test as the condition precedent of child-work, also half-time for children between ten and twelve years of age, in order that they might continue their education at their employers’ expense. Owen travelled all over England to collect evidence against the white slavery, as he called it, and attended nearly every meeting of the committee which sat, as he says, for two years to inquire whether it was unhealthy for children of six and upwards to work fourteen or fifteen hours a day in stifling rooms. The subsequent limitation of the act (1819) to textile industries attests the opposition which the bill evoked, and the crucial character of Owen’s evidence. The bill was brandmarked “New Lanark,” and the Lanark workmen described it as a measure to extend their privileges to their fellow-workers (see their address to Owen, 7th May 1818); but whether Owen drew the bill and gave it to Sir R. Peel, as he asserts, may be doubted.

(2) But secondly, the views in the *New View* were described as a first dose, which should prepare for a second and stronger dose. This last was contained in his report to Archbishop Sutton’s Committee on Distress, which sat in the London Tavern during 1816, and was referred by them to Sturges Bourne’s poor-law committee, and published 1817. It recommends “villages of union and mutual co-operation,” mainly agricultural but partly manufacturing, and containing (say) 1200 people. The odd plan of a parallelogram within which the villagers were to live

recalls BELLERS' "Colledge of Industry," which PLACE unearthed for him (1817?); and still more that characteristic outcome (in 1807) of the "l'esprit rectangulaire," as REYBAUD calls it, of the then unknown FOURIER, the phalanges. The villages were to carry on collective industry and to provide out of its profits, or better still its produce for the wants of the workers and of the infirm. They were to become first self-governing, then self-sufficient, and the ultimate goal was communism. [*Autobiog.*, ii. 303. *Explanation of Causes of Distress* (1823), § III.] Common life was to lead to common profits, and he should have added, but did not add, common losses. Now, for the first time, he advocates the integration of industry, an advocacy which ripened in his Lanarkshire Report (1820), and Dublin Reports (1823), into opposition to division of labour. The *New View* appealed to "laws of nature"; now he poses as the sole experienced "economist"; in the 1820 Report he announces that he has discovered "a new science—the science of the influence of circumstances, which is the most important of all the sciences." He was in France in 1818. Macnab speaks of his views as "social" in every page of pt. 1 of his report (1819); but M. Reybaud's assertion that the word "socialist" was not invented to denote these views until after Owen formed "the association of all classes of all nations" (1835), has not been refuted. The socialism embodied in these reports (1817, 1820, 1823), involved three distinct proposals.

(a) His first proposal was that 100 "philanthropists" should each invest £1000 at 5 per cent in starting a scheme. The Duke of Kent's committee, which included RICARDO, TORRENS, and others, recommended this scheme, but only £8000 having been subscribed on 1st December 1819, it was abandoned. Again, as the result of his Lanarkshire Report, operations began at Motherwell, with a capital of £50,000 advanced by the British and Foreign Philanthropic Society, but fell through from want of funds. Here the projectors expected, Peabody-fashion, to redeem the capital as well as pay interest, and then devote their profits to starting new institutions of the same character. Vandeuleur's Ralahine (1831) was the outcome of Owen's Irish visit, and broke down through the bankruptcy of Vandeuleur, who was patron-landlord, long before the community of tenants bought their freedom (see CO-OPERATIVE FARMING). A more important scheme was set on foot by Abram Combe and Hamilton of Dalzell, who were disciples of Owen, at Orbiston. The founders subscribed £25,000 and opened their barrack-like establishment of some 300 members in September 1826. The members soon resolved on trying communism after the founders were paid off; but long before this, Combe died (August 1827), and the business in a few months went bankrupt and the barrack was razed. But Owen had neither scot nor lot in this scheme. He was launching his scheme at New Harmony, Pennsylvania. Owen's attention had, in 1817, been called to a communistic settlement of Shakers in the New World. In 1812 John Melish printed his travels, which contained an account of a sect of "Rappites" who settled in

1805 at Harmony. Each village of 800 or so converged to a central square, and radiated into cottages where each family lived separately, had separate gardens, poultry and hogs, but in other respects lived a common life, worked mainly on agriculture, and enjoyed the profits of their work in common. In 1824 Owen went to America, bought Harmony from the Rappites for £28,000, and advertised for settlers, 900 of whom came. On 27th April 1825 he laid down as principles for the new community that (1) each should hold his goods as part of the common stock, but might withdraw at any time; if so, his goods or their value were restored to him; (2) all should work, but as a temporary provision, Owen should value the work done by each. He left for England in June, returning on the 12th of January. On the 5th of February the New Harmonists enacted (1) that all property should be held upon trust for the community; (2) a member withdrawing was only entitled to such compensation as a general assembly awarded him for his services; (3) other than this, services, etc., were not valued. On the 8th March Owen, who had not taken part in creating the new constitution, was once more despotic manager. The February constitution had meanwhile driven out malcontents into the neighbourhood, where they formed sub-colonies. In most cases, Owen granted long leases to the sub-colonists, or advanced money at 4 per cent interest for the necessary buildings and purchases; and the land so let or sold was subject to restrictive conditions against touching profits till the debt was paid off; and after that, against the division by members of profits amongst themselves, and also against spirituous liquors. And there were colonies modelled on New Harmony,—thus Miss Frances Wright advanced money to found a colony in which black and white men were equal, and permanent marriage was abolished. The latter, but not the former principle was extended to New Harmony on 4th July 1826; a date signalled by the *N. H. Gazette* as the 51st of American and 1st of Mental Independence. In another case, a Mr. Maclure advanced money to buy land and to found schools after the manner of Pestalozzi. In all these cases some one was landlord or mortgagee, subject to options to redeem or purchase; but no redemption or purchase took place. In spring 1827 Owen declared the New Harmony experiment closed. Next Maclure's, and then (1st February 1828) Miss Wright's scheme was abandoned. A few weeks later Owen resumed the last leases of the sub-colonies on the ground that their stores competed against one another, and that their external trade was run by monopolists. After these dates, the colonists and sub-colonists left, or had to support themselves. Owen, by an expenditure of £40,000, or  $\frac{2}{3}$ ths of his fortune, had helped to keep his colonists going for one or two years mainly on charity—a satirical commentary on his favourite dictum that the rich deceive themselves when they think that they support the poor, since the poor support the rich. Experiments are not communistic, because workers receive subsistence in lieu of wages; communism implies the division of produce; here, so far from there being a net produce to divide, there was a

large net loss which fell almost entirely on one man.

(b) Nearly ruined in America, Owen returned to England to find a second branch of his scheme of 1817, 1820, and 1823, blossoming and fruitful. He had urged artisans and others with £100 (the third class in his reports), to mass their capital and elect a committee of members to superintend its application to work. Interest was payable on capital. He believed that this scheme would soon pay hugely, and that those who took part in it "began their journey near their journey's end." Co-operative capitalistic industries scarcely existed in England before 1817. Owen now returned (August 1829) to find co-operative stores in full swing, with an admirable organ of their own in Dr. King's *Co-operator* (1st May 1828 to 1st August 1830). In setting to work to develop and federate them, he employed two characteristic methods: (i.) he tried to merge them in a wider movement, and for this purpose formed a centre of culture with lectures, a paper (*The Crisis*), annual co-operative congresses, social festivals, etc.; the Mechanics' Institute, Bromley's Bazaar (Gray's Inn Road), Burton Street Chapel, and 14 Charlotte Street, were the successive "Meccas" of the new movement. The burden of the lectures was usually economical, e.g. "do without the middlemen." "If work is organised, an eight hours' day will be possible" (this idea first appeared in a letter by Owen, dated 9th August 1817). "The land belongs to the people." "That country is happiest which has most producers and fewest distributors." "A graduated property-tax is the best form of taxation." "International congresses should be promoted," etc. Feargus O'Connor lectured for them once, and in May 1833 the Magna Charta of social regeneration was issued partly under Owen's auspices. In 1834 a "Grand National Consolidated Trades Union," or union of all the working classes, was started. On May day 1835 the association of all classes and all nations was formed, with paid lecturers, etc. A man attended its lectures for three months, and was examined in Owen's philosophy before being elected member. It was a forestalling of university extension tacked on to co-operative and trade unionist movements. Owen's energy as a lecturer was fabulous; and in 1836, according to the *New Moral World*, ii. 214 (its new organ), there were 100,000 members. The new phasis was wrecked partly by Owen being called to superintend a new abortive Owenite community at East Tytherley, Hants (1839 to 1844), whose members alternately elected and deposed Owen as despotic manager, and had, as usual, to be kept going by other people's capital, partly by the socialists, as they called themselves, transferring their attention from economy to marriage and religion. Owen's ideas on these subjects are clearly indicated in the report by the Home Colonisation Society of his public discussion with Brindley at Bristol (cp. *Observations on the Manufacturing Systems*, 3rd ed. app. p. 42). In 1840, the bishop of Exeter and Duke of Wellington advocated, in the House of Lords, prosecutions for blasphemy; the East Tytherley community drained their funds; and the rank and file threw mud at them, which stuck

(see e.g., *Socialism as it is*, by Giles, 1838; *The Human Ecoloeobion or New Moral Warren*, 1842). Finally the movement worked itself out, while political chartism, free trade, and trades unionism in its modern sense came to the fore. (ii.) A second colouring was given to the co-operative movement by Owen's currency craze. The 1820 report first puts into the forefront (1) Falla of Gateshead's rediscovery of the value of spade industry in cultivating wheat as the agricultural counterpart of Arkwright's discovery; and (2) the abolition of coined money as the counterpart in distributive economics of machinery in productive economics. As to this last nostrum, it was perhaps due to a misunderstanding of Ricardo's dictum, that labour is the measure of "real value" (as to which see MILL's *Pol. Econ.* iii. xv.; M'Culloch's *Pol. Econ.* ii. i.), and to a belief in the superiority of paper to coin, which he shared with ATTWOOD and PEEL, whom he had aided in opposing the resumption of cash payments by the Bank of England in 1819. In 1830 (address to merchants) he reads these ideas into non-co-operative movements. "The wholesale and retail trade of the kingdom will soon be absorbed by a few great houses, which principle will continue to obtain until the whole business shall be taken up by *banking bazaars*." Between 16th June and 3rd September 1832 he converted his central offices into an "Equitable Bank of Exchange," which was afterwards called "The National Co-operative Trades Union and Equitable Labour Exchange," and was meant to substitute labour, which he called "intrinsic value," for money as the measure of value (see LABOUR EXCHANGE). The average hour's work "contained in commodities" was to be the unit of measurement (cp. *Autobiogr.* ii. 302; see KARL MARX). Say, a pair of boots contained "twenty hours' work, and a pair of trousers "forty hours' work; the cobbler would come to the bank, deposit his boots, and receive a note for twenty hours, and return next week with a second pair and receive a second note; and then if he wished, receive a pair of trousers for his two notes. For this purpose, it was essential to equalise every one's hour's work. Pending the difficulty of getting workmen to submit to this levelling, he adopted a provisional scheme which had two features: (i.) if the boot-maker who brought boots said, "I paid five shillings for materials"; the valuer wrote him down ten hours; money value of materials was the gauge of hour-credit; (ii.) bad work was counted as "containing" fewer hours than it actually took; there was a despotic valuer at headquarters. Further complications arose when (iii.) provision merchants and farmers fought shy of the system; and (iv.) 9000 hours' value was purloined from the store—a loss which Owen made good, though not legally liable.<sup>1</sup> After this last event (27th July 1833), Owen was superseded at headquarters; and the

<sup>1</sup> R. Owen's Rotunda in Gray's Inn Road: "I did not witness the introduction of the millennium, and I believe that soon after this time the Rotunda, with its happy auguries, came to an end. The excellent and truly philanthropic founder [R. Owen] spent three or four fortunes on his efforts to raise his fellow men, and his failures were in consequence of his implicit trust in human nature, and his conviction that any one may

central organisation broke up in 1834. This scheme first inflated then ruined the co-operative societies to whom it was, in the first instance, addressed. They were the principal victims. On 1st August 1829 there were 70 (*King's Co-operator*), on 1st February 1830 there were 172 (*London Co-op. Mag.*), on 30th June 1832 there were over 400 (*Crisis*, i. 59), on 27th October 1832 there were over 700 co-operative societies (*Crisis*, i. 135), between which Owen forged these paper links; three or four years later, the number had dwindled to fifteen or so. The organisation of co-operators by means of a central exchange might have been of great help; as it was, Owen's splendid follies acted as an advertisement which stimulated co-operation to an abnormal and evanescent excess.

(c) The third branch of the scheme (of 1817, 1820, and 1823) was that poor-law authorities should set these communities going. He based this plan on the "just and legal right" of the poor to relief which does not degrade, and to employment (cp. *TURGOR'S Droit au Travail*); and added provisions for gradually converting paupers into co-operators, and making (c) lead to (b). The government obviously seized hold of Owen's speech against the disuniting effects of churches (21st August 1817), to reject the motion made to give this scheme a trial (see speeches of Wilberforce and VANSITTART, in House of Commons, 14th December 1819). The Leeds committee rejected Owen's pauper scheme as based on *a priori* grounds, New Lanark being a manufacturing village, not an agricultural paradise of a parallelogram (1819). The Lanarkshire committee in 1820 approved of the scheme as the basis for starting a county Bridewell, then shelved it. It was not so overseas. Leigh Hunt's *Examiner* (25th April 1819), *The New Moral World*, 3rd July 1841; Mary Hennell's *Social Systems*, etc. (1844), and J. Wolber's *R. Owen* (1878), attribute the institution in 1818 of farm colonies for the unemployed in North Holland, at Frederiksoord, etc., by benevolent societies quite as much to Owen's as to General Van den Bosch's initiative; and the subsequent incorporation of "beggar colonies" of paupers in this scheme (1820-1859) was clearly due to this portion of Owen's reports (see INDUSTRIAL COLONIES).

But the reorganisation of industry was the only thing he cared about. Political reform was a matter of indifference; although power he knew would ultimately shift to the productive workers (see, e.g., *Crisis*, iii. 114). He first addressed a manifesto to the working classes as such in April 1819, and urged a plea for vested interests. The short passage in the first three editions, and the Scotch and American editions of the *New View*, opposing reformers as premature, was afterwards struck out. In the *Crisis*, iii. 114, 3, he indicates the supreme importance of strikes and trades unions as compared with mere political movements. He scarcely alludes to revolution in his earlier works; but deprecates that of 1830, as expressing only individualism and competition (*Crisis*, i. p. 49, etc.), and with

absurd ignorance accuses Mazzini of fostering revolutionary tendencies of the same competitive and individualistic character (*Robert Owen's Journal*, 22nd November 1851). Cold rather than hostile to any political movement, he thought industrial experiments the only social factor of paramount importance, and was as confident of success for his scheme, which he said had never been tried, in his addresses to the first two Social Science Congresses (1857 and 1858), and until he was led out of the latter, leaning on Lord Brougham, home to die, as he was at the very first outset of his career of reconstruction. "Owen," said Bentham, "begins in vapour and ends in smoke." His style is vapoury, from the time when he preached the Millennium (1st January 1816) at New Lanark, until the date of his journal entitled *A Journal Exemplary of the Means to Well Place (and Well Feed, Well Clothe, Well Lodge), Well Employ and Well Educate (Well Govern and Cordially Unite) the Populations of the World* (1850 to 1852), or until the date of his *Millennial Gazette* (1856-57). But we prefer Lord Brougham's description of his good humour and childlike simplicity (see Hansard, 14th December 1819); or Torrens's allusion to his "moral grandeur" (cited in Macnab's *New Views Examined*); or Leigh Hunt's "Yet I could at any time quit these writers, or any other, for men who in their own persons, and in a spirit at once the boldest and most loving, dared to face the most trying and awful questions of the time—the Lamennais and Robt. Owen, the Parkers, the Fosters, and Newmans."

[Robert Owen, *Autobiography* (1857-58) (ends 1823, and contains nearly all his writings down to 1822 in appendices, needs corroboration in his vivid dialogues and his dates).—A. J. Booth, *Robert Owen, the Founder of Socialism in England* (1869), critical and biographical.—W. L. Sargant, *Robert Owen and his Social Philosophy* (1860), biographical and hostile.—Jones Loyd, *The Life, Times, and Labours of Robert Owen* (1889-90), biographical and friendly.—F. A. Packard, *Life of Robert Owen* (1st ed. anon. 1866; 2nd ed. 1868), unimportant.—Robert Dale Owen (R. Owen's son), *Threading my Way: Twenty-Seven Years of Autobiography* (1873).

Criticisms of Owen are contained in *The Edinburgh Review* (1819).—Malthus, *Essay*, bk. iii. (6th ed. 1826), disapproving.—A. F. Paget, *Introduction à l'Etude de la Science Sociale* (2nd ed. 1841).—M. R. L. Reybaud, *Études sur les Réformateurs contemporains ou Socialistes modernes* (3rd ed. 1842-3).—G. J. Holyoake, *History of Co-operation in England* (1875-9).—B. Potter, *The Co-operative Movement in Great Britain* (1891), pp. 12-81; as to anticipations of Rochdale Pioneers, see pp. 61, 67.—S. and B. Webb, *History of Trade Unionism* (1894), pp. 119, 143, 151.—R. W. Cooke Taylor, *The Modern Factory System* (1891), p. 209. and G. Wallas, *Life of Place* (1895).

As to the American experiments see *The New Harmony Gazette*, ed. by R. D. Owen, Frances Wright, from 1st Oct. 1825 to 3rd Oct. 1827.—*The Co-operative Magazine* (Jan. 1823-Jan. 1830). Both are Owenite papers and therefore communistic.—J. H. Noyes, *The History of American Socialism* (1870), compiled from valuable original materials collected by A. J. Macdonald, but not thorough.

As to the "Equitable Exchange" experiments see the Owenite paper *The Crisis*, ed. by R. Owen and R. D. Owen (19th May 1832 to 27th April 1833). It appealed mainly to co-operators. Then it was named *The Crisis and National Co-operative Trades Union and Equitable Exchange Gazette* (27th April 1833 to 16th August 1834), in order to appeal equally to non-co-operative trade unionists.

As to the subsequent propaganda see the Owenites paper *The New Moral World* (1st Nov. 1834 to 15th Nov. 1841). Its full title up to 22nd Oct. 1836 is *The New Moral World conducted by R. Owen and his Disciples*, or

attain perfection in any line if properly educated" (*Mrs. de Morgan's Autobiography*, p. 160).

[For illustrations of the notes in use and further details, see Art. on LABOUR EXCHANGE.]

merely *By Disciples of R. Owen*: after which R. Owen's name is omitted. Its full title after 18th July 1838 is *The New Moral World or Gazette of the Universal Community Society of Rational Religionists enrolled under the (Friendly Societies') Acts*. The U. C. S. of R. R. were the paying members of the association of all classes; they could not have been enrolled under these acts, if their payments had been made for co-operative purposes.]

[See CO-OPERATION; FACTORY ACTS; SOCIALISM.]

J. D. R.

OWLERS were smugglers of wool or sheep to the continent when the exportation from England was prohibited, between the Restoration and the beginning of the 18th century, in the interest, as was supposed, of the home manufacture of cloth. The chief export station for rough wool was Romney Marsh, but much went also from Sussex, Essex, and Hampshire, and combed wool was smuggled in considerable quantities from Canterbury. French boats well armed received the wool at night, and their captains generally succeeded in eluding the armed sloops which guarded the Channel, and

the severe penalties which were enacted against them, and of course enacted in vain as long as the owlers could make a net profit of 3d. on every pound of wool they exported. It is uncertain whether the term "owling" is a corruption of "wooling," or is derived from the smugglers' practice of carrying on their trade by night.

[John Smith, LL.B., *Chronicon Rusticum Commerciale, or Memoirs of Wool*, 1747, ii. 30, 206, 324, 536, 546, 561, with reference to Rapin, *Continuation*, p. 371.—*England's Interest Asserted*, 1669, and *England's Interest by Trade Asserted*, 1671, both by W. Carter.—*Abstract of Proceedings of W. Carter*, 1694.—*Excidium Angliæ and Angliæ Restaurata*, both by the Cheshire Weaver, 1727.—Bischoff's *Woollen and Worsted Manufactures*.—Dowell's *Hist. of Taxation*, iv. 433.—Rogers's *First Nine Years of the Bank of England*, p. 32.—Stephen's *Criminal Law*, iii. 228.]

E. G. P.

PACIOLI or PACIOLO, FRA LUCA (15th century), sometimes called Luca da Borgo, from his native village in Tuscany, was a Franciscan monk and distinguished mathematician.

He published at Venice in 1484 his *Summa de Arithmetica, Geometria, Proportioni e Proportionalita*, republished at Toscolano 1523. This contains much information on the commercial practice of his time, especially on partnership, sales, interest, drafts, and bills. His own leanings are towards a liberal interpretation of the doctrines of the CANON LAW (*q.v.*) on these subjects; he also explains clearly the method of book-keeping by double entry, particularly developed in Venice, thence called *alla Veneziana*.

A new edition of the part of this treatise relating to book-keeping was published by Vincenzo Gitti (*Fra Luca di Pacioli: Trattato di computi e scrittura*) Turin, 1878; according to Goldschmidt, *Handbuch des Handelsrechts*, Stuttgart, 1891 (p. 246, note 36), it is very defective. See also Libri, *Histoire des sciences mathématiques en Italie*, iii. p. 133.—Jäger, *Lucas Pacioli und Simon Stevin und Der Traktat des Lucas Pacioli*, Stuttgart, 1878, who has in the latter followed the defective text of Vincenzo Gitti.

E. Ca.

PACKMAN. A term applied to pedlars who carry their goods in a pack (see PEDLAR).

J. E. C. M.

PACOTILLE: *Fr.* (maritime trade). Seamen's ventures, or goods captains and crews were formerly allowed by custom to take with them in small quantities, on trading voyages, to sell on their own account. They were free of freight, and the practice was tolerated to interest seamen in the expedition. In the early days of maritime discovery, before the creation of factories or depots of merchandise in distant countries and colonies, the word *pacotille* was also employed to describe cargoes of

navigation to barter with or sell to the natives. By extension cheap common goods carried by pedlars are called *pacotille*, and the word is now used in disparagement to describe any merchandise as being of inferior quality. T. L.

PAGANO, FRANCESCO MARIO (1748-1799). Born in Brienza (Basilicata); a distinguished jurist and a martyr for Italian liberty. At twenty he began to publish his legal works. He commenced by teaching criminal law at the university of Naples. Persecuted for the ideas expressed in his writings, and exiled, he went to Rome and taught public law at the university there. He was recalled to Naples in 1799 to take part in the provisional Neapolitan government—he arranged the plan for the constitution of the republic, and presided at the legislative council. When the Neapolitan revolution was quelled he was condemned to death and executed. Pagano's memorandum on the trade in fish is of importance to economists; he follows the ideas of the physiocrats, and demands domestic freedom of trade.

In this treatise, written to convince the people of the advantage of continuing the abolition of the excise on fish, which some wished to re-enforce, Pagano observes that the price of goods is naturally determined by their quantity, and the demand for them, and that nature—through freedom of trade, not law—must fix the price. Price, established by law, may be wrong, and may damage both buyers and sellers. He would also remove the monopoly of sale granted only to a few, and would allow the fishermen themselves to sell—this right to be accorded to others as well as to fishermen; all crafts to thrive in freedom. Thus Pagano desired the abolition of all the corporations of arts and crafts, and of all obstacles and restrictions on

[Fornari, *Delle teorie economiche nelle provincie Napoletane*, vol. ii. Milano, Hoepli, 1888.—Alberti, *Le corporazioni d'arti e mestieri e la libertà del commercio interno negli antichi economisti italiani*, Milan, Hoepli, 1888.] U. R.

PAGE, FREDERIC (1769-1834), a Berkshire country gentleman, author of *Principles of English Poor Laws Illustrated and Defended*, Bath, 1822, 2nd ed., London, 1829, 8vo, and of *Observations on the State of the Indigent Poor in Ireland*, London, 1830, 8vo. In the first, he insists that, through the intervention of the State, the indigent have a right to relief from the possessors of property. He advocates the extension of select vestries under the Sturges Bourne Act 1819 (see POOR LAW), and a strict discrimination in granting relief, according to character. The pamphlet is chiefly interesting as describing the working of the old poor-law system, under the most favourable circumstances. The later pamphlet is written to advocate a poor law for Ireland. H. E. E.

PAGET, AMÉDÉE (died about 1850), was a disciple of C. FOURIER (q.v.), and wrote:—

*Introduction à l'étude de la science sociale* (Paris, 1838 and 1841), which is considered one of the best statements of his master's doctrines.

E. Ca.

PAGNINI, GIOVANNI FRANCESCO (1715-1789), born at Volterra in Tuscany, held office in the financial department of the Tuscan government. He was a member of the "Società dei Georgofili" of Florence, a skilful agriculturist, and an able writer.

Well acquainted with the writers of the school of natural right and some English philosophers, he translated (published at Florence, 1751, two vols.) Locke's works: *Two Treatises of Civil Government* (1690); *Some considerations on the lowering of Interest*, etc. (1691); *Further considerations concerning raising the value of Money* (1698). He then reprinted parts of the *Manuali pratici*, which the two bankers Francesco Balducci and Giovanni da Uzzano had written in the 14th and 15th centuries for the use of merchants.

In his essay "On the right price of Commodities, etc.," he demonstrated that the Romans, who sought wealth only through war, adopted some provisions which were quite contrary to that principle which, as he says, "is able to procure its citizens or subjects the power of using advantageously the produce of its territory, as well as to protect and forward manufactures and facilitate the export of both manufactures and natural products; and as far as possible to prevent the introduction and consumption of foreign goods." And as the system of conquest was no longer possible, and by themselves the states could no longer provide for agriculture and war, Pagnini praised and suggested such measures of government as were not designed to procure the state abundance of foreign commodities and goods, but

to save it also "the expense which the consumption of the same would imply, and to enable it also to acquire the gold and silver of other nations." In his remarks on the question of value, Pagnini did not follow the doctrines of LOCKE, whom he had translated, but those of PUFENDORF. He admitted the existence of an actual market value only, not that of a natural or normal value; and he maintained, though he gave it a special meaning of his, the theory of supply and demand as VERRI, ORTES, GIOIA, GALIANI, and others had done. He also maintained that the ideas of the Romans about the origin and functions of money were altogether opposed to the theories of modern economists, a thesis which was completely refuted by NERI and CARLI (see PAULUS JULIUS). In his work *Della Decima* (see DÉCIMES), Pagnini gives a history of that tax and the trade of the ancient Florentines, with a digression on the value of gold and silver, and on the rate of prices of commodities in the 14th and 15th centuries compared with those of the 18th century. This work is still of use in the study of prices.—*Saggio sopra il giusto prezzo delle cose, la giusta valuta della moneta e sopra il commercio dei Romani*, inserted in Custodi's *Raccolta*,—*Scrittori classici d'economia politica*, modern part, t. ii., Milano, 1813.—*Della Decima*, Lisbona e Lucca, 1765, and Firenze, 1756-66. A. B.

PAGODA, HISTORY OF. A gold coin of southern India, known also by the native names of *varāha* or *hān*, the former word indicating the "Boar" *avatār* of Vishnu, figured on south Indian coins from the 5th century onwards, whilst *hān* (=gold) is their later Mahomedan name. From the 16th century onwards this was the Portuguese "*pardao de ouro*," perhaps meaning "a quarter" of a gold rupee. The name pagoda is sometimes derived from Persian words meaning idol-temple, but more commonly from the Sk. *bhagavat*=holy, for the reason given in Fra Paolino's *Viaggio* of 1796 that the coin bore "the effigy of the goddess Bhagavadi, a name corrupted into pagoda by Europeans" (cp. Linschoten's *Travels* of 1596):—"They are Indian and Heathenish money with the picture of a Diuell upon them and therefore are called Pagodas." The effigy in question was that of Krishna, or Swāmi, whence the "swamy-pagoda" of Madras, containing about 46 grains of fine gold. Still better known was its successor, the "star-pagoda" of Madras, which was the standard coin of south India till 1818. This coin, bearing the eponymous device of a star, contained by law 42·048 grains fine, and was therefore worth about 7s. 6d. There were also Pondicherry and Porto Novo pagodas worth about 1s. less. All these three varieties were familiar at the beginning of the present century throughout the Indian currency area, which then included not only Ceylon and Mauritius, but also the Cape and St. Helena. Even in New South Wales, in 1800, the pagoda was constituted a legal tender. By proclamation of 7th January 1818 in Madras the coinage of the gold pagoda

was stopped, in view of the establishment of the silver rupee as the standard coin of the presidency. With the pagoda gold disappeared from normal circulation in India.

[*Acts and Regulations of the East India Company*.—Chalmers, *History of Currency in the British Colonies*, London, 1893.—Zay, *Histoire monétaire des Colonies Françaises*, Paris, 1892.—Thurston, *History of the Coinage of the East India Company*, Madras, 1890.—Sir H. Yule, *Hobson* R. C.]

PAINE, THOMAS (1737-1809), born at Thetford (Norfolk), died in New York; held an appointment in the excise, on his dismissal from which in 1774 he went to Philadelphia; there, through introductions from Franklin, he made friends and obtained employment in journalism. He took an active part in the American War of Independence, and in 1777 was made secretary to the committee of foreign affairs. His *Crises* (1776-83) were acknowledged by Washington and others as having powerfully assisted the cause of separation. Leaving America in 1787, he visited Paris and London, where he published his *Rights of Man* (1791 and 1792), a reply to Burke's *Reflections on the French Revolution*. He was thereupon elected to the convention, and subsequently to the committee for framing a new constitution. His association with the Girondins aroused the enmity of Marat and Robespierre, and he spent the greater part of 1794 in prison, where he completed his *Age of Reason*. He returned to America in 1802.

Paine's merits and defects are those of a partisan. In his economic, as in his political and religious writings, his aim is not the complete investigation of a subject with a view to the discovery of truth, but the application of foregone conclusions to particular cases; he displays, however, moral though not intellectual sincerity, along with much originality and acuteness of observation. His style is clear and vigorous, and he is a master of telling and suggestive phrases, like his definition of government as "a mode rendered necessary by the inability of moral virtue to govern the world" (*Works*, vol. i. p. 71), and his anticipation of the spirit of the Monroe doctrine—"Nothing but continental authority can regulate continental matters" (*Works*, vol. i. p. 107). The *Crises* (1776-83), the *Forester's Letters* (1776), and the *Letter to Raynal* (1782), which deal with the subject of colonial and imperial relations, are still of interest as an exposition of the disadvantages arising from too close a connexion between the mother country and a fully developed colony. But Paine was obviously mistaken in regarding political independence as the only means of freeing colonial trade from vexatious restrictions, and in denying that the colonies had derived any benefit from British protection during the wars of the 18th century. How little he realised the force of the imperial idea was shown by his attempt to prove that Canada and Halifax were possessions useless to England, and inevitably destined to amalgamation with the States (*Works*, vol. ii.

pp. 123-5). The value of another group of works, treating of administration and its relation to economics, and including *Common Sense* (1776), *Prospects on the Rubicon* (1787), *The Rights of Man* (1791), *Address to the Addressers* (1792), and the *Dissertation on the First Principles of Government* (1795), is diminished by the prevalent fallacy that "every civil right grows out of a natural right" (*Works*, vol. ii. p. 307). Paine, however, is in harmony with modern thought in his refusal to identify society with government (*Works*, vol. i. p. 69), in his support of the principle, first perceived by the Physiocrats, that the prosperity of a commercial nation is regulated by the prosperity of its rivals (*Works*, vol. ii. p. 457), and in his condemnation of illicit trade (*Works*, vol. i. p. 379). He was the author of several ingenious schemes of taxation, including one for the abolition of the poor-rate (*Rights of Man*, pt. ii., 1792). In the *Dissertation on Government, the Affairs of the Bank, and Paper Money* (1786), according to Mr. Conway, he overwhelms "the whole brood of heresies—State privilege, legal tender, repudiation, retrospective laws" (*Life*, vol. i. p. 217). But, like some other advocates of "honest money," Paine is not free from the heresy of regarding abundant currency as a disadvantage (*Works*, vol. i. p. 226). Among his other works may be mentioned the *Letters* (1779), in which he argues for the "natural right" of the United States to the Newfoundland fisheries; *Public Good* (1780), dealing with the question of state sovereignty; and *Agrarian Justice* (1797), opposing the system of landed property, and containing a proposal for state compensation in money to those debarred from the possession of land.

[The references in the text are to Paine's *Works*, ed. Conway, London and New York, 1894-6; and to Conway, *Life of Thomas Paine*, London and New York, 1892. See also *Dict. of Nat. Biog.*, London, 1895, vol. xliii., article "Paine, Thomas," by Leslie Stephen.] E. R. F.

PALE (IRELAND) denoted the district within which direct English law and control existed. First used in the 15th century, it applied to the greater part of the four counties of Dublin, Louth, Meath, and Kildare. The Statute of Drogheda (1494) provided that the pale should be surrounded by a double fence and ditch to prevent marauding incursions by the Irish. The chief points in this boundary were Dundalk, Kells, Naas, and Tallaght.

[Hardiman in *Tracts on Ireland*, vol. ii. (1841), issued by the Archæological Society.—Bagwell, *Ireland under the Tudors*, vol. i. p. 123.]

C. F. B.  
PALEY, WILLIAM (1743-1805). Paley was senior wrangler 1763, fellow of Christ's College, Cambridge, 1766, chaplain of Bishop Law at Carlisle, 1769. After holding various livings he became archdeacon of Carlisle (1782), the title by which he is best known.

He wrote at greatest length on natural theology and the evidences of Christianity (*Horæ Paulinæ* 1790, *Evidences of Christianity*, 1794, *Natural Theology*, 1802). The two writings that bear

most on economics are the *Principles of Moral and Political Philosophy* (1785) and the tract, *Reasons for Contentment addressed to the Labouring Part of the British Public* (1793). This tract was written at a time when there was war with France together with depression of trade and general suffering, when there was much public agitation in favour of reform, with much straining of the laws against sedition, when booksellers great and small were prosecuted for selling Paine's *Rights of Man*, "that being treason in duodecimo which is innocent in quarto" (Windham). Paley tells the grumbling mob that they should not make comparisons, but do their own duty and mind their own concerns (4, 5); let them consider that the same law which protects the rich in their property protects the poor man in his, and as the poor man is the weaker he needs the protection more (5, 6). Besides, the labouring man has as much of the real pleasures and blessings of life as the rich, without the care and the temptations (7-11, cp. 14, 15). Indeed in security and certainty of provision for his family the poor is superior (11, 12). Service for wages Paley takes to be "the best way of conducting business, because all nations have adopted it" (13), and it is as equitably regulated in England as anywhere (13). "I have no propensity to envy any one, least of all the rich and great; but if I were disposed to this weakness, the subject of my envy would be a healthy young man in full possession of his strength and faculties, going forth in a morning to work for his wife and children, or bringing them home his wages at night" (18). Finally changes of condition that break up our ordinary habits of living "never can be productive of happiness," "it is not only to venture out to sea in a storm but to venture for nothing" (22). This pamphlet was meant quite seriously, and attracted some attention.

Paley seems not to have studied either HUME or Adam SMITH. In his *Moral and Political Philosophy*, he borrows his utilitarian doctrine from Abraham Tucker's *Light of Nature Pursued* (1768-78). He is on the whole a defender of things as they are, though this sometimes leads him into hazardous arguments. He defends the institution of property by urging that it increases the produce of the earth, preserves it to maturity, prevents contests about it, and "improves the convenience of living," by allowing division of employments and encouraging art and invention (*ib.* ch. ii.). "The poorest and the worst provided, in countries where property and the consequences of property prevail, are in a better situation with respect to food, raiment, houses, and what are called the necessities of life, than any are in places where most things remain in common" (*ib.* ch. ii.). The foundation of the right of property is not, as LOCKE said, labour, but "the law of the land," and that is founded ultimately on "the will of God" (ch. iv.). The special chapters on contracts of sale, hazard, inconsumable property, lending, and labour, ch. vi.-xiv., have little or no economic value, though ch. viii., on general consequences, has some points neatly put in the style of BASTIAT'S *Popular Sophisms*.

In the chapters on charity (pt. ii. ch. i.-v.) there are instances of arguments reaching farther than the author intended; e.g. "it is a mistake to suppose that the rich man maintains his servants, tradesmen, tenants, and labourers; the truth is they maintain him." "All that he does is to distribute what others produce, which is the least part of the business." One chapter (v.) on pecuniary bounty can hardly be reconciled with the *Address to Labourers*; "the dread of want" is included among the evils of poverty, and the plea that "the poor do not suffer so much as we imagine" is rejected: "the question is not how unhappy any one is, but how much more happy we can make him."

The section (bk. iii. pt. iii.) devoted to marriage is more of a sermon than an economic discourse on population. We need of course to remember that the book is not professedly economic. The subject of "population and provision" is discussed by itself in a later section, bk. vi. ch. xi.). Paley thinks that on the whole "twice the number of inhabitants will produce double the quantity of happiness." "It may and ought to be assumed in all political deliberations that a larger portion of happiness is enjoyed amongst ten persons possessing the means of healthy subsistence than can be produced by five persons under every advantage of power, affluence, and luxury." "Consequently the decay of population is the greatest evil a state can suffer, and the improvement of it the object which ought in all countries to be aimed at in preference to every other political purpose whatever." He allows "the tendency of nature, in the human species,<sup>1</sup> towards a continual increase of its numbers." "The two principles upon which population seems primarily to depend, the fecundity of the species,<sup>1</sup> towards the capacity of the soil, would perhaps in all countries enable it to proceed much further than it has yet advanced." "The condition most favourable to population is that of a laborious, frugal people ministering to the demands of an opulent luxurious nation, because this situation, whilst it leaves them every advantage of luxury, exempts them from the evils which naturally accompany its admission into any country." This is the passage criticised by MALTHUS (*Essay*, iv. xiii.); Malthus quotes a passage in Paley's *Natural Theology* (ch. xxvi.) where Paley seems to modify his views. He had (in the *Mor. and Pol. Phil.*) regarded luxury as bad for the luxurious, though good for those that supplied them; "the business of one half of mankind is to set the other half at work" (vi. xi.). In the *Natural Theology* he says that "mankind will in every country breed up to a certain point of distress," a point which will be high or low according to the country. He also accepts the statements of Malthus (the author of "a late treatise upon population") in regard to geometrical increase. Malthus draws the inference that Paley must now admit luxury to be a benefit to the luxurious themselves, and the wide diffusion of luxury to be a safeguard against overpopulation, in so far as luxury raises the "point of distress" higher and produces a check on

<sup>1</sup> Cp. *Nat. Theol.* ch. xxvi., where the same "superfecundity" is allowed of all animal life.

population sooner. For Paley's philosophy and theology, see Leslie Stephen's *English Thought in the 18th Century*, vol. i. (1876), and Mackintosh's *Dissertation on Ethical Philosophy* (7th ed. of *Ency. Brit.*). J. B.

PALISSY, BERNARD DE (1500-1589), died a Protestant prisoner in the Bastille. Celebrated for his artistic pottery, his *figulines rustiques* as he called them, he enjoyed for a time the protection of the kings of France, after having exhausted his own slender means, and worked for sixteen years, to discover the composition of the enamels used in Italy.

Though a poor and illiterate man, he left several works remarkable for clear insight into natural and economic phenomena. In geology he was in many respects a harbinger of modern science. In his *Recepte véritable pour apprendre aux hommes à multiplier leurs trésors* (1563), he gives useful advice to agriculturists on the use of manures—their object is to return to the soil the elements which have been exhausted by the crops. "Philosophy," he affirms, should lead and direct agriculture. In his *Traité des Métaux et Alchimie*, (1580), a dialogue between "Théorique" and "Practique," he ridicules the futile researches of alchemists, who, he said, should be called "anti-philosophers"; according to the opinion of Practique: "A pestilence, a war, or a famine would be less injurious than six men who knew how to make gold in great quantity. If once their process were divulged, everybody would despise tillage, and land would remain a waste . . . Gold would become so depreciated that nobody would give bread or wine in exchange." This view, so strikingly in advance of the times, was, a century later, again expressed by LEIBNIZ in his *Oedipus Chymicus*. Palissy's works were republished in 1880, one vol. [Henry Morley, *Palissy the Potter*, London, 1852. E. Dupuy, *B. Palissy, l'homme, l'artiste, le savant, et l'écrivain*, Paris, 1902.] E. ca.

PALMER, J. HORSLEY (1780-1858), for fifty years one of the most eminent and esteemed of English merchants, became a director of the Bank of England in 1811, and governor for the three years 1830-1832.

Palmer gave an able explanation of the working of the system of the bank (see BANKING; BK. OF ENG.) before the committee of 1832 on the bank charter. He further stated his views in *The Causes and Consequences of the Pressure upon the Money Market, with a Statement of the Action of the Bank of England from 1st October 1833 to 27th December 1836*, London, 1837, 8vo, which called forth a reply from S. JONES LOYD (q.v.), *Reflections suggested, etc.*, 1837, republished in *Tracts*, 1858. Palmer defended his position in a *Reply to the Reflections, etc.*, 1837, 8vo. His views are further criticised in Tooke's *History of Prices*, vol. iii. pp. 91-114. Palmer also wrote *Reasons against the proposed Indian Joint-Stock Bank*, London, 1826, 8vo.

[*Times*, 11th February 1858.—*Annual Register*, 1858.] H. E. E.

PALMERI, NICOLO, born at Termini, Sicily (end of 18th century, died July 1837). His liberal principles prevented him from seeking

public employment. He lived in obscurity, devoting his life to study.

He was an economist of the school of Adam SMITH. Besides many minor writings published in reviews and newspapers, he wrote an *Historical Résumé of Sicily*, and an essay in which he demonstrates the wretched state of Sicilian agriculture, recommending, with a courage unusual for the epoch and country in which he lived, the opening of the Sicilian ports to free trade with foreign countries as the only remedy for existing evils. Even in our times, when the Sicilian problem, far from being solved, or even appeased, has grown more acute and alarming, the remedies proposed by Palmeri are still worthy of consideration. His essay, which fell accidentally into the hands of Francesco Ferrara, induced the latter to apply himself to economics. (See *The Life and the Doctrine of Francesco Ferrara*, by A. Bertolini, Bari, 1895).

*Saggio delle cause e delle angustie attuali dell'economia agraria della Sicilia*, Palermo, 1826.

A. B.

PALMIERI, GIUSEPPE (1721-1794). Born in Martignano, province of Lecce; of a noble Neapolitan family; was an economist, financier, and statesman. He began life as a soldier, and then became a disciple of GENOVESI; he again returned to military life, in which his career was brilliant, but at thirty-eight he finally abandoned it and devoted himself to study, agriculture, and public life. In 1738 he was charged with the reorganisation of the finance of the province of Lecce, and in 1791 was made director of the board of finance in the kingdom of Naples.

As a statesman, Palmieri tried to apply the principles of economic science to public administration; he rescued the latter from many abuses, promoted the abolition of turnpike tolls and feudal rights, and together with FILANGIERI assisted greatly in the formation of the Neapolitan customs tariff of 1788, which was a great step towards simplifying taxation and a rational organisation of the customs.

His views on commerce are of especial importance. He advocates moderate protection to commerce and agriculture; he admits the advantages of free trade applied universally—absolute freedom for commerce in the interior; but he suggests for Italy limits to the freedom of foreign trade as a defence against foreign competition, and to assist the promotion of national industries as other countries do.

He combats the doctrines of the PHYSIOCRATS, especially with respect to the importance of foreign trade, which he maintains to be a true source of wealth for the nation. He was the soul of the theoretic and practical reform of the study of economics and finance in the kingdom of Naples towards the end of the last century.

He discussed the general theory of taxation, as well as detailed questions of finance, and

originated and encouraged many interesting discussions on the errors and prejudices of existing systems and necessary financial reforms. He minutely analyses taxation, preferring, on the whole, indirect taxation. This opinion had many supporters in his day, but for variety of observation, critical acumen, largeness of ideas, and diversity of argument, Palmieri far surpasses all other writers of his time. His works gave a great impulse to the scientific life of his day, and proposed improvements into public administration by showing the baneful effects of the existing system on trade and economics.

The fundamental conception of the financial reforms suggested, and to a great extent carried out by him, consists in greatly simplifying the system of taxation combined with freedom to trade, agriculture, and traffic. Abolition of internal customs, reduction of frontier customs, particularly of those on export of goods, reorganisation of customs tariffs and reform of the crown estates, were the measures proposed by Palmieri for the improvement of the economic position and finances of the kingdom of Naples.

Palmieri wrote, *Riflessioni sulla pubblica felicità relativamente al regno di Napoli*, Napoli, 1787.—*Pensieri economici relativi al regno di Napoli*, Napoli, 1789.—*Osservazioni su vari articoli riguardanti la pubblica economia*, Napoli, 1790.—*Lettera sulla nuova tariffa doganale*, Napoli, 1790.—*Della ricchezza nazionale*.—Napoli, 1792.

[See on Palmieri, among others, Ricca Salerno, *Storia delle dottrine finanziarie in Italia*, 2nd edition, Palermo, 1896.—Fornari, *Delle teorie economiche nelle provincie napoletane*, vol. ii., Milan, 1888.—Gobbi, *La concorrenza estera e gli antichi economisti italiani*, Milan, 1884.] U. R.

PALMIERI, MATTEO (1405-1475). In his treatise *Della vita civile* (Florence, 1529) Palmieri deals with political economy and finance. He supports proportional and condemns progressive taxation proposed at that time in Florence, as he considers diversity of fortune is in the order of nature, and should not be altered by taxation. The basis of Palmieri's opinion is that taxation is an obligation to the state, imposed on all citizens in return for the assistance given by the state in the formation of private fortunes, and that it should be distributed among them in proportion to wealth, so that property may bear its part without changing the natural distribution of wealth. This is a very remarkable conception for those days, as it shows that even then the most important financial controversies turned on this point, and it offers a certain analogy to the modern doctrine of equality of sacrifice.

[Ricca-Salerno, *Storia delle dottrine finanziarie in Italia*, 2nd ed., Palermo, 1896.—Cossa, *Introduzione allo studio dell' economia politica*, Milan, 1892.] U. R.

PANIC, COMMERCIAL. See CRISES.

PANNAGE. Originally this word seems to have meant simply the food, acorns, beech mast, etc., which pigs could find for themselves in a wood. Generally, however, in mediæval records, it means either the right of feeding pigs in a particular wood, or the annual rent paid for that right. Thus, the statement, that in a certain wood there is pannage for twenty pigs, means that twenty pigs could pick up a living there: A. B. has pannage for twenty pigs in such a wood, means, that A. B. has the right to turn out twenty pigs, to find a living there; while in the forest-officer's accounts the word pannage would mean the rent paid by A. B. for this right.

[Pipe Roll Society's publications, vol. iii.—Cowel's *Interpreter*, London.] A. E. S.

PAOLETTI, FERDINANDO (1717-1801), parish priest of S. Donnino at Villa Magno, near Florence, was an intelligent practical agriculturist and an excellent writer on that subject.

A follower of the PHYSIOCRATS, Paoletti published, 1769, *Pensieri sopra l' agricoltura*, part of which CUSTODI inserted in his *Raccolta* (see *Scrittori classici di economia politica*, modern part, t. xx.), and, 1772, *I veri mezzi di render felici le società*, in which, as every physiocrat in Italy as well as in France did in his time, he brought forward free-trade ideas on the corn-trade. His belief in the good effects of free-trade induced him to reproach BANDINI for his prejudice against public stores of produce (see GRENIERS D'ABONDANCE). Yet he supported, in his *Veri mezzi*, taxes on luxuries, the idea of aiding the exportation of commodities not of the first necessity such as oil, wine, etc.; and in his *Pensieri* protective duties to encourage agriculture. Cossa therefore (*Introduction*, p. 269) rightly places Paoletti among those who, though accepting the new theories of the physiocrats, could not altogether give up the old ones of the mercantilists.

*Pensieri sopra l' agricoltura*, Firenze, 1769, 2nd ed. 1789.—*Veri mezzi di render felici le società*, Firenze, 1772 (in *Raccolta del Custodi*). A. B.

PAOLINI, GIOVANO BATTISTA (end of 18th century). Born in Pistoja, an eclectic writer on economics, his idea is that laws cannot be fixed on absolute and universal principles, but must be subservient to conditions of time and place, so that under different circumstances any system may be advisable. In foreign commerce Paolini recommends "legitimate," not "absolute freedom"—that is, "a right to cultivate, work, transport, export, and introduce such goods as are useful to the whole country—this freedom to be limited and regulated by laws and duties wherever the good of the country demands it. Hence in the application of such freedom it is necessary to consider the existing circumstances of the country," hence also "certain economic laws might be good for ancient but bad for modern nations."

Paolini wrote, *Della legittima libertà del com-*

mercio, Florence, 1785. (See Gobbi, *La concorrenza estera e gli antichi economisti italiani*, Milan, 1884.) U. R.

PAOLINO, a Minorite of Venice, lived in the first half of the 14th century. In the solitude of the monastery he devoted himself to study the political and economical problems of society with brilliant talent, but also with the defects common to his age and condition, namely a complete submission to the doctrines of Thomas AQUINAS (*q.v.*), and a total want of practical knowledge of men and things.

His name and work would probably not have been known had not Prof. Mussafia, an Italian philologist teaching at Vienna, published, in 1868, with notes, the *Traffato di Fra Paolino*, in which he speaks of the family and of the state, laying down rules for their moral encouragement, as the many writers *De regimine, institutione, eruditione Principum* of that time had done, among whom the poet Petrarch (1304-74), *De republica optime administranda*; Egidio Colonna (1247-1316), *De regimine Principum* (anterior to Paolino) among the politicians; and Andrea d'Isernia (1220-1316), among the juriconsults, are worthy of being mentioned.

*Traffato de regimine rectoris* (1313-1315), Vienna, 1868. A. B.

PAPER BLOCKADE. A phrase used to denote a blockade maintained by an insufficient force or by no force at all. INTERNATIONAL LAW requires that a belligerent power, which claims the right of capturing all vessels attempting to run in or out of an enemy's port, shall have rendered ingress and egress dangerous by sending a ship or ships of war to cruise off the port in question, in such a position and in such numbers that they are almost certain to intercept all who approach (see BLOCKADE). This is the only kind of blockade neutral states are bound to submit to. The fourth article of the DECLARATION OF PARIS laid down that "blockades to be binding must be effective, that is to say sufficient really to prevent access to the coast of the enemy." In drawing up this rule the statesmen of the Congress of Paris of 1856 did but formulate an accepted principle. The ARMED NEUTRALITY (*q.v.*) of 1780 had declared not only that there must be evident danger in entering the blockaded port from the proximity of the blockading squadron, but also that the vessels which composed it must be stationary. In 1800 the second armed neutrality added that ships were entitled to a warning by the commander of the force which closed the port, and might not be captured unless they made an attempt to enter after having been warned. The great agreement of 1856 was silent as to these fanciful restraints upon the undoubted right of a belligerent; but gave the sanction of express consent to the just and reasonable rule which forbids a power at war to interfere with neutral trade by merely forbidding com-

merce with its enemy's ports. This had been done often enough in mediæval times, and was not unknown as late as the 18th century. But the great events of the close of that epoch, and the growth of a reasoned system of maritime law from the decisions of the prize courts of the leading nations of Europe and America, settled definitely that a belligerent could not enjoy the rights against neutrals given by blockade without fulfilling the obligation of maintaining his blockade by a sufficient naval force. The civilised world has accepted this principle for more than a century. The violations of it, ordered by Napoleon's Berlin and Milan decrees, and the retaliatory British Orders in Council, were justified on both sides as reprisals for the illegal violence of the enemy (see CONTINENTAL SYSTEM; ORDERS IN COUNCIL). But no attempt was made to show that they were part and parcel of ordinary international law. The statement that Great Britain upheld paper blockades up to the time of the declaration of Paris is entirely destitute of foundation (Calvo, *Droit International*, iv. 177). The slightest knowledge of the decision of Lord Stowell, our great judge of the Courts of Admiralty during the long war with Napoleon, would be sufficient to dispel this illusion. Our own country is at one with others in insisting upon the wholesome rule that belligerent ports cannot be hermetically sealed against the commerce of the world by a mere paper decree. The great economic importance, to a country situated as Great Britain is, of freedom of access—where possible—to the ports of the world, needs no comment.

[Fauchille, *Du Blocus Maritime*, Paris, 1882.—Manning, *Law of Nations*, i., edited by Amos, bk. v. ch. vi., London, 1875.—Lawrence, *Principles of International Law*, pt. iv. ch. v., Boston and London, 1895.—Case of the *Betsey* in C. Robinson's *Admiralty Reports*, i. 93.] T. J. L.

PAPER MONEY. See MONEY.

PAPER, TAXES ON, fall under two heads, those on paper as a manufactured article, and those on newspapers and advertisements. (1) The tax on paper, varying according to quality, was imposed in 1712, increased in 1714; it included a duty of 1s. a square yard, in addition to the ordinary duty, on all printed, painted, or stained paper used for hangings or other purposes. The yield in 1793 was in Great Britain £83,079, and, the tax being raised in 1794 and doubled in 1801, while the manufacture was greatly improved, by 1802 the yield had risen to £268,000 for England alone, by 1815 to £476,019 for Great Britain. The complications attending the incidence and collection of the duties, apart from the social disadvantages produced by taxes on knowledge, led in 1836 to the consolidation and simplification of the tax, which was fixed at 1½d. a pound on all sorts of paper alike, except the

stained and other paper used for hangings, which was now freed altogether. An attempt to repeal the whole tax was defeated by the Lords in 1860, but carried in 1861, at which time the yield was about £1,350,000. Many reasons combined to turn the scale against the taxes; they were so complex that it was difficult for papermakers to understand their liabilities; other manufactures into which paper enters, though supposed to be free, were virtually taxed; all other manufactures being by this time freed, it was either invidious to keep taxes on one, or else unfair to protect it; and as most of the required supply of rags, the raw material of paper, could be had in England, reciprocal duties were not needed to protect the trade against the large export duty on rags levied in France. In spite of prophecies to the contrary, the manufacture has largely increased since the repeal.

(2) A tax was first imposed on newspapers at the same time as on paper in general, half sheets were to pay  $\frac{3}{4}$ d., whole sheets 1d., and every advertisement 1s. Each great war saw these rates increased, and once in 1789 they were raised in time of peace. The highest point reached was  $3\frac{1}{4}$ d. for half sheets and 4d. for whole sheets in 1797, with 3s. 6d. for every advertisement before the end of the French Revolution war. But the latter tax was reduced to 1s. 6d. in 1832, and altogether repealed in 1853; while the tax on newspapers was lowered in 1836 to 1d., provided the paper did not exceed certain limits of size, and was repealed in 1855. The newspapers of Great Britain paid, in 1749, £16,450; in 1815, £383,696; in 1831 over £552,000. After a temporary drop owing to the reduction of the duty the yield rose again, and at the time of the repeal reached £488,010, the immense impetus to publication having nearly compensated for the lowered rate. The advertisement revenue rose from £125,000 in 1815 to £181,000 in the year of the repeal of the tax.

PAR. On the stock exchange, the nominal or face value of a security. With government or municipal stocks, and British railway stock, "par" is always taken at £100—with shares in companies, at the amount called up. For new issues, before the special settlement has taken place (see *SETTLING DAY*), it is customary to give quotations at so much "premium," or "discount" (*q.v.*), reckoned upon the amount called up to date. R. W. B.

PAR OF EXCHANGE. See MINT PAR.

PARADISI, AGOSTINO (1736-1783), occupied one of the earliest established chairs of political economy in Italy, and was in his day

a well-known prose writer and poet. In 1772 Duke Francis III. appointed Paradisi to teach economics at the university of Modena, endowed by him with new statutes and branches of study. Paradisi held this chair until 1780, when the new duke, for economy's sake, reduced the pay of the professors. On this Paradisi resigned and retired to Reggio, his native place, where he died three years later, president of instruction. His unpublished *Lezioni di economia civile* were highly valued in his own day. During the last years of his teaching Paradisi put them aside to use as a textbook Condillac's *Le commerce et le gouvernement* (published in 1776), which he translated and annotated in a work that has also never been published. Copies of the manuscript of his lectures are in the libraries at Modena and Reggio-Emilia. The more important part of the work is the special treatment of the subjects of value and wages.

In Paradisi's writings the influence which the French philosophy of the 18th century exercised on his mind may be traced as well as the doctrines of the physiocrats.

Paradisi and MURATORI were precursors of the economic, financial, and administrative reforms originated and partly carried out in Modena under Duke Hercules III. (reigned 1780 to 1796).

[Cossa, *Saggio di economia politica*, Milan, 1878. — *Sulle prime cattedre di economia in Italia*. — Graziani, *Le idee economiche degli scrittori emiliani e romagnoli*, Modena, 1893.] U. R.

PARAGIUM, holding in equal portions as well in rights and privileges as in actual property (Ellis). The full scope of the word is given by Kelham, who says it "signifies equality of name, blood, or dignity; but more especially of land, in the partition of all inheritance between co-heirs; or it is when the younger brothers hold their share of the fee of the elder brother, and he [holds] of the lord and does homage and service, they contributing their shares." On folio 96 b of Domesday we read, xxii. *masures quas tenebant*, xx. *homines in paragio*; and on folio 51 b, Wislac and Aluric, two tenants *in capite*, are recorded as holding *in paragio*.

[Ellis, *Introd. to Domesday*, i. 241. — Kelham, *Domesday Book illustrated*, p. 290. — Pollock and Maitland, *History of English Law*, ii. pp. 261, 274, 239, treat the subject exhaustively.]

R. H.

PARCENERS. When two or more persons have become entitled to an estate by descent as co-heirs, they are called, in law, coparceners or parceners. This happens by the common law chiefly in the case of females; but as the heirs of a sister deceased become coparceners with the surviving sisters, males may stand in that position.

The custom of gavelkind also led to coparcenary among male heirs. It was the only form of joint ownership in which the

ancient common law granted the power of severing estates without mutual consent. The estate in coparcenary devolving on persons by the act of the law and not by agreement, it was held that no lack of consent should prevent a change into a more convenient form of ownership. This was formerly done by a writ of partition, now abolished by 3 & 4 Will. IV. c. 27, § 36. When the partition is voluntary it must be effected by deed, when otherwise the aid of the Court of Chancery is available. Sales may now be effected under 31 & 32 Vict. c. 40, and 39 & 40 Vict. c. 17, and so the difficulties which used to arise with regard to mansions and certain commonable rights can be avoided.

Cases of coparcenary as early as A.D. 1200 may be found in F. W. Maitland's *Select Civil Pleas* (Selden Society).

[Blackstone's *Commentaries*.—J. Williams, *Law of Real Property*.—Brett, *Commentaries on present laws of Engl.*, 1891.—Pollock and Maitland, *History of English Law*, ii. pp. 272-276, 304.] R. H.

PARDESSUS, JEAN MARIE (1772-1853), a lawyer, judge at the *Cour de Cassation* (supreme court), professor of commercial law, and at various times a member of the French representative assemblies. His *Collection des Lois Maritimes antérieures au XVIII<sup>e</sup> Siècle* (Paris, 6 vols., 1828-39) gives the original text and French translations of all maritime laws from the remotest periods, with notes and a historical introduction. The first eleven chapters (Antiquity and Middle Ages) were reprinted separately in 1847 under the title of *Us et Coutumes de la Mer* (2 vols.).

Pardessus also published *Lettres de Change*, (1807) a treatise on bills of exchange; *Servitudes* (1829) on legal liabilities of property and *Cours de Droit Commercial* (1831). E. ca.

PARE, WILLIAM (1805-1873), son of a Birmingham cabinetmaker and upholsterer, was one of the earliest and ablest of the disciples of Robert OWEN, having been converted to his doctrines by William THOMPSON, whose *Inquiry into the principles of the distribution of Wealth*, published in 1824, he re-edited in 1850. He was corresponding secretary of the first Birmingham co-operative society, and Mr. Holyoake says of him that "he was at his death the oldest and best informed co-operator in England." He was compelled to resign the office of registrar of births, deaths, and marriages in Birmingham, in consequence of Dr. Philpotts, then Bishop of Exeter, having brought before the House of Lords the fact that he sympathised with socialist views. He became an active apostle of Owen's system; he undertook several "missionary tours" for the purpose of preaching it, and was for some time governor of the Owenite community of Harmony Hall in Hampshire.

His writings are: *The Claims of Capital and Labour: with a sketch of practical measures for their conciliation*—a paper read before the Dublin Statistical Society, 1854. The immediate occasion of this paper was the strike and lock-out at Preston in 1853-54. The measures he suggests are (1) a reform of our money laws which would abolish the use of gold, or of anything in itself valuable, as a measure of value. This seems to point to the adoption of Owen's system of Labour notes (see LABOUR EXCHANGE); (2) universal and compulsory education and industrial training from a very early age. This does not necessarily imply, but was probably in his thought connected with, an associative, as opposed to the domestic, rearing of the young; (3) an alteration in the law of partnership, giving not only limited liability (see LIABILITY, LIMITED), but a limited authority and control; (4) the formation of INDUSTRIAL COLONIES (*q.v.*) at home by funds advanced on loan by the state, as a practical recognition of the right to labour.—*Equitable Commerce, or Cost the limit of Price*, read before the British Association, 1855, the object of which was to explain and defend the labour exchanges devised by Owen and carried on in establishments founded by him in London and Birmingham.—*A Plan for the suppression of the Predatory Classes*, a paper read before the Social Science Association, 1862. The plan was that all premises serving as harbours for the criminal classes, or in any way used in complicity with them or their practices, should bear the whole burden of the taxation necessary for the detection and punishment of crime, so that the owners would be forced either to obtain honest tenants or dispose of their property to those who would.—*Co-operative Agriculture: a solution of the Land Question*, 1870, in which is given an account, founded on personal observation, of a co-operative agricultural association established in 1830 by Mr. John Scott Vandeleur, a resident Irish landlord of position, on his estate of 618 acres at Ralahine in the county of Clare (see CO-OPERATIVE FARMING). This experiment, notwithstanding the ignorance and previous turbulent disposition of the labourers, seems to have been for some time eminently successful, both economically and in its moral influences, and to have failed only in consequence of the proprietor's financial ruin and flight to America, caused by his gambling propensities. The book is mainly a narrative of facts, written in a lively and readable style, and the story told in it certainly deserves attention from all who take a practical interest in improving the condition of the agricultural population. The Ralahine system did not conform to any standard type. It might be called a modification of the *métairie* system (see MÉTAYAGE), the tenants paying to the landlord not a fixed proportion of the produce, but a fixed amount. Pare was one of Owen's literary executors, and, at the time of his death, was preparing a life of him from the large collection of letters and other documents which he had in his hands.

[Holyoake's *Hist. of Co-operation*, vol. i. pp. 86, 89, 145, 282, 358, and his *Sixty Years of an Agitator's Life*, vol. i. p. 40.—E. T. Craig, *History of Ralahine* (London), 1882, pp. 158, 161. *Inter*

alia, Owen's Labour notes were tried there (p. 75, etc.), (see LABOUR EXCHANGE). Also an article partly founded on family information, in the *Dictionary of National Biography*.] J. K. I.

PARIEU, FELIX ESQUIROU DE (1815-1893), was born at Aurillac, and died in Paris. As an economist his name is particularly connected with two questions—the INCOME TAX and MONOMETALLISM, on both which he displayed great erudition supported by remarkable literary talent. After having practised with distinction as a lawyer at Riom, he was elected by the department of the Cantal in April 1848 to the national constituent assembly. He succeeded in attracting attention there by his intelligence in economic questions. He was directed to draw up in the name of a parliamentary commission, 1st September 1848, a report on a plan for a progressive tax on successions and donations, including any DONATIO MORTIS CAUSA; and in his report he substituted the principle of proportionality for that of progression. On the 30th of the same month he made another report on the income tax. The minister of finance had proposed a tax levied by assessment (*Impôt de répartition*) of 60,000,000 francs (say £2,400,000). M. de Parieu transformed this into a tax levied by a percentage of 3 per cent (*Impôt de quotité de 3 per cent*). This tax applied to all personal property, even to income derived from the funds; it was not, however, proposed as a single tax, as it was to take its place by the side of other taxes.

These two proposed bills came to nothing; but they had at least the useful result that they impelled De Parieu to publish first the *Histoire des impôts généraux sur la propriété et le revenu*, 8vo, 1856, and then the *Traité des impôts considérés sous le rapport historique, économique et politique en France et à l'étranger*, which last went through two editions, the 1st in 5 vols. 8vo (1862-64), the 2nd in 4 vols. 8vo (1866-67). These two works, now out of print, have taken their place as classic. The first won for the author admission to the Institut (*Académie des Sciences morales et politiques*) in 1856. The question of monometallism on gold succeeded in his thoughts to that of the income tax. In 1857 he, almost alone, proposed the 25-franc piece, and gold as the standard. The object that henceforth he aimed at was the subordination of silver to gold and the establishment in all countries of gold monies of the same weight and value. As a politician M. de Parieu was a member of the constituent and legislative assembly of 1848, minister of public education from October 1849 to June 1851; member of the council of state, 1852-55; vice-president of this council, 1855-70; minister president of the council of state in the cabinet of Olivier; a member of the national assembly; then, after the Franco-German war, a senator until 1884.

A short time before the fall of the second empire De Parieu published an argumentative work: *Principes de la Science Politique*, 8vo. Pure democracy, that is to say the republic, does not figure in this work as the ideal of the author who, it should be remembered, approved though he did not take part in the *coup d'état* of 2nd December 1851. A. C. F.

PÂRIS-DUVERNEY, JOSEPH (died 1770), born at Moras near Grenoble, died near Château Thierry, was the third in order of birth of the four brothers Pâris, and first in that of capacity. The eldest, Antoine Pâris, was guardian of the royal treasury, an office from which he retired in 1730 in favour of his youngest brother Jacques Pâris de Montmartel. The second of the brothers called himself Pâris de la Montagne, from the sign (*à la Montagne*) of the inn his father kept. The father, who himself possessed considerable ability, established each of his sons in a vocation requiring first-rate business capacity. During the last years of the reign of Louis XIV., the brothers Pâris, who always lived together on the most affectionate terms, undertook the commissariat service for the forces stationed in Flanders and on the Italian frontier. They themselves, no doubt, obtained great profits from this, while by their good administration, the promptitude of their decisions, and their intelligent forethought, they were enabled to render great services to the armies.

Under the regency, the committee of finance, presided over by the Duc de Noailles, accepted favourably (1716) the financial plans of Pâris-Duverney, which for some time counterbalanced the growing influence of LAW, by arranging in shares the lease of the farm of the taxes (see FARMER GENERAL) which they had secured by contract at an annual payment of 48½ millions. This enterprise, a rival to that of the Scotch financier, was called by the people *Anti-Système*.

LAW, by his influence, succeeded in annulling the lease of the farm of the taxes, which he undertook at the rate of 52 millions. The brothers Pâris then fell into disgrace and were even exiled from their native country so long as the SYSTÈME lasted. When LAW sank, the real minister of finance was Pâris-Duverney, the official controllers-general continuing only for the sake of appearances. It was Pâris-Duverney who broke with the *Système*, and established that enormous operation, the *Visa*, which examined into the private property of more than 500,000 persons who had more or less had a share in the transactions of the *Système*.

It must be admitted that the energy of the rival of LAW sometimes went too far, betraying him even into arbitrary acts, but his reputation of honesty never suffered. Pâris-Duverney was reproached for having too systematically opposed the ideas of the author of the *Système*.

When Cardinal de Fleury attained power, the brothers Pâris again fell into disgrace; Pâris-Duverney was even imprisoned in the Bastille for two years (1727-28). Justice, however, was done him in the end, when it was found that there were no grounds whatever for the charge brought against him.

Pâris-Duverney left many works in manuscript which have never been printed. This is a real loss considering their subjects, and that they are the work of so eminent a financier.

The list of his works according to Luchet is : *Traité des monnaies de France depuis le commencement de la monarchie jusqu'au 1<sup>er</sup> Janvier 1724. — Traité des domaines du roi depuis leur origine jusqu'au 1<sup>er</sup> Janvier 1725. — Traité des gabelles de France depuis leur commencement jusqu'au 1<sup>er</sup> Janvier 1726. — Traité des rentes depuis François 1<sup>er</sup> jusqu'à l'année 1725. — Traité des colonies françaises et de leur commerce depuis leur fondation jusqu'à l'année 1723. — Traité des changes créés ou supprimés depuis 1689 jusqu'au 1<sup>er</sup> Décembre 1721. — Dépouillement des droits existants sur les marchandises contenus dans le tarif de 1664 jusqu'à l'an 1726, avec les variations arrivées sur chaque espèce.*

A remarkable book has been attributed to him, *Examen du livre intitulé : Réflexions politiques sur les finances et le commerce par Dutot, 1740, 2 vols. 12mo.* a review of the principle and effects of the *Système*. The warmth with which the writer defends the *Visa* is thought to show that he was the author of it.

The different operations of Law's scheme "are explained so fully, so clearly, and with so much order and distinctness, by Mr. Du-Verney, in his 'Examination of the Political Reflections upon Commerce and Finances of Mr. Du Tot,' that I shall not give any account of them" (Adam Smith, *Wealth of Nations*, bk. ii. ch. ii. p. 139, ed. M'C.). The *Examen* is also referred to in bk. ii. ch. iii. and in bk. v. ch. iii. p. 414.

[A very interesting life of Pâris-Duverney is contained in a little volume attributed to M. de Luchet, *Histoires des Messieurs Pâris, 1776, 12mo.* See also *Dict. de l'écon. politique.*] A. C. F.

**PARISH.** The importance of the parish for civil purposes dates from the Tudor period. Originally the smallest administrative unit was the township, upon which the ecclesiastical parish was usually modelled. With the rise of feudalism the TOWNSHIP was transformed into the MANOR. But in the 16th century the manorial system had decayed, whilst the ecclesiastical organisation of the parish was in full vigour. The churchwardens took care of the church fabric, and the vestry or assembly of householders met in the church under the presidency of the incumbent. Under Henry VIII. the churchwardens were charged with the relief of the poor. The poor law of Elizabeth, passed in 1601, directed that two justices of the peace dwelling in or near the parish should appoint overseers of the poor, who were to act with the churchwardens in this business. An act of Philip and Mary laid upon the parish

the maintenance of highways, and created the office of parish surveyor. During three centuries the parish continued to be, under the county and the corporate town, the most important administrative subdivision. But it proved unsatisfactory, especially for the purposes of poor relief. Accordingly, the new poor law of 1834 created unions of parishes and transferred to them the relief of the poor. Subsequent legislation made similar changes with reference to public health and to highways. Thus the parish came to be little more than a constituent unit of the union, and a district for the collection of rates and the preparation of jury lists and parliamentary and municipal registers. An attempt to reform the larger parishes was made in 1831. Hobbhouse's Act enabled parishes with 800 rated householders and upwards to choose a select vestry. Alike in the meetings of the common vestry and in the election of the select vestry the plural vote was admitted, and a large ratepayer might have as many as six votes. The incumbent was *ex officio* chairman in the select as well as in the common vestry, and the churchwardens still had equal powers with the overseers. Thus the ecclesiastical and the civil administration of the parish were still united. But the ecclesiastical and the poor-law parish did not always coincide, owing to the frequent subdivision of the ecclesiastical parish in recent times. There are in England about 15,000 poor-law parishes, varying greatly in extent and population. The majority have from 300 to 1000 inhabitants, but many have less than 50.

The Local Government Act 1894 (56 & 57 Vict. c. 73) has made a parochial revolution. Its principal objects were (1) to separate the civil from the ecclesiastical organisation of the parish; (2) to render the constitution of the parish absolutely democratic; (3) to enlarge considerably the powers of the parochial authority. The act applies to all parishes not included in the metropolis, in a corporate town, or in a local board district. The parish is defined as a place for which a separate poor-rate is or can be made, or for which a separate overseer is or can be appointed. The act provides that every rural poor-law parish, having a population of 300 or upwards, shall have a parish council. Parishes with less than 300 inhabitants may have councils if the inhabitants wish and the county council approves. Otherwise they may be grouped with neighbouring parishes. Every parish to which the act applies is to have a parish meeting. The parish meeting consists of all persons on the local government register or parliamentary register, who each have one vote and no more. It assembles at least once a year, and elects the parish council if there is one. Where there is no parish council, the parish meeting has all the powers of the former vestry. It has

power to adopt certain acts relating to baths and washhouses, recreation grounds, free libraries, etc.; to sanction the sale or exchange of parish property, and to incur any expense not involving a loan or a rate of more than 3d. in the pound. It must appoint a chairman, and may appoint a committee to transact routine business.

The parish council is to be elected annually at a parish meeting. Any person having a vote in the parish meeting, and any person who has resided twelve months in the parish, is eligible as a councillor. Each elector has one vote for each of the number of persons to be elected. The number of councillors is to be fixed by the county council, but must not be less than five or more than fifteen. The council must elect a chairman who will hold office for the year. It is a body corporate, and has power to hold lands without license in mortmain. The parish council is to take over all the powers formerly exercised by the vestry, except those relating to church business, and the powers of boards of guardians with respect to allotments and small holdings. It has power to acquire land for public buildings, recreation grounds, allotments, etc. If it fails to obtain land for any of these purposes, it may petition the county council, which may make an order compelling owners to sell the land required. If the county council refuse to make an order, the parish council may petition the Local Government Board. If any owner feels aggrieved by an order of the county council, he may present a memorial to the Local Government Board. In either case, the Local Government Board will institute a local inquiry, and make such an order as it thinks fit, which will be final. No additional allowance is to be made for compulsory purchase. The parish council has, subject to similar qualifications, a power of hiring land compulsorily for allotments. It has also extensive powers with respect to parochial charities other than ecclesiastical. It may not enter on expenditure which will involve a loan or a rate exceeding 6d. in the pound, without the sanction of the county council. The position of the former officers of the parish is changed by the act. The incumbent and the churchwardens are now deprived of all authority except in church business. The overseers, formerly appointed by the justices, are now to be appointed by the parish council. Some of their functions are transferred to the council itself.

[Gneist, *Constitutional History of England*.—Wright and Hobhouse, *Local Government and Taxation* (last ed. by Hobhouse and Fanshawe); the editions of the *Local Government Act* 1894, by Humphreys and Ryde.—Emery, *Complete Guide to Local Government Act*.—E. Jenks, *Eng. Local Govt.*, Methuen, 1896.] F. C. M.

**PARITY OF VALUE.** A term used for a variable par as between gold and silver ex-

changes. In the Indian exchanges, so long as the mints were open, the value of the rupee was  $\frac{1}{4}\frac{1}{4}$  of the price of an ounce of standard silver, plus about 3 per cent for charges, and the parity was found by multiplying the day's price by .383. The mints being closed, the rupee becomes a protected monopoly, and its value is a matter of negotiation.

Calculations as to parity are also required in bullion transactions between London and various foreign markets. In London, quotations for gold and silver are always for standard fineness—i.e. 916·6, and 925 respectively. In Paris and Berlin both metals are quoted fine; in New York gold is quoted for 900, and silver for 999 fine. R. W. B.

**PARK.** See **FORESTS, MEDIAEVAL.**

**PARK, JAMES ALAN** (1763-1838), English judge, was called to the bar in 1784.

In 1816, Park was appointed a judge of the court of common pleas. He published (1787) his *Law of Marine Insurance*, a standard work, which passed through many editions, and was written under the direct encouragement of Lord Mansfield.

[*Biographical Dictionary of English Judges*, by E. Foss.] H. E. E.

**PARKER, HENRY** (1604-1651), barrister-at-law, was the author of twenty-four political pamphlets on the popular side (1640-47, 1650-51), of one on *Reformation in Courts and cases testamentary* (1650), and of one, *Of a Free Trade, a discourse seriously recommending to our nation the wonderful benefits of trade, especially of a rightly governed and ordered trade, setting forth also most clearly the relative nature, degrees, and qualifications of libertie which is ever to be enlarged or restrained according to that good which it relates to as that is more or less ample* (1648). The latter was written during his sojourn at Hamburg (1647-49) (*Gentleman's Magazine*, xxxv. 109) as secretary to the Merchant Adventurers there (*Col. of State Papers, Dom. Ser.*, 1649-50, p. 34). It is a defence of the privileges of the Merchant Adventurers against the attacks of "free traders," like Brent, in his *Discourse consisting of motives for the enlargement of freedom of Trade* (1645), and VIOLET, in his *Advancement of Merchandise* (1651, pp. 10-12), and reads like a clever abridgment of J. WHEELER's *Treatise on Commerce* (1601). He attacks INTERLOPERS (individual merchants) and "pedlars" (retail traders), and although, like Wheeler (*l.c.* p. 101 *et seq.*) he repudiates the charge that his company is a monopolist, he defends "stinting" (limiting exports); the practice of selling at Hamburg and Antwerp only, and only on certain days; apprenticeship, etc.; and advocates more "reglement of trade" on the usual ground that trade would become "overstocked," "confused," and "straggling," and would very soon die unless it was "well ordered."

Order, he thinks, will prove an economy, and pruning will promote trade; and trade magnifies a nation more than war does. Like war, trade is an outcome of men's "wolvish" instincts which when pressed into the service of the state are turned into virtues (pp. 18, 19). RALEGH's

Ideal of the state merchant, and envy and praise of Holland, are always present to his imagination; and he praises his company for its religion, law, charity, navy, and diplomacy rather than its wealth. He is more of a politician than an economist. Indeed his views on wealth are indistinct. In an age when MADDISON (*England's looking in and out*, 1640), Battie (*Merchant's Remonstrance*, 1648), and ROBINSON (*Proposals in order to the People's Freedom*, 1652) dinned into willing ears that trade only enriches if there are net exports which bring in money; and when POTTER modified this theory by his doctrine that money is a mere security for obtaining "things of real value" (*Key of Wealth*, 1650); and Maddison (*l.c.* p. 11), L. ROBERTS (*Treasure of Traffike*, 1641, p. 22), and Φιλάνθρωπος (*The Advocate*, 1651, p. 13) undermined the application of the theory by urging that "no lawes are prevalent against gain," Parker wrote: "Exports conduce perhaps more to profit, and things imported to security; yet . . . both . . . conduce to both. Native commodities more immediately afford us treasure: and forraign commodities are more usually materials for shipping, etc., . . . yet sometimes we retayle the same to strangers for gain" ("profit" and "gain" mean money), a sentence to which neither MISSELDEN nor MALYNES could have objected. He clearly wishes to face both ways.

J. D. R.

**PARLIAMENT, ROLLS OF.** This name has been given to the ancient records of the proceedings of parliament kept by the clerks of the chancery. They extend from the sixth year of Edward I. to the nineteenth year of Henry VII. 1278-1503 A.D. In later times their place has been supplied by the journals of the two Houses. The journals of the House of Lords began in the first year of Henry VIII. 1509 A.D., and the journals of the House of Commons in the first year of Edward VI. 1547 A.D. In 1832, the Rolls of Parliament were published in six volumes, folio, under the title *Rotuli Parliamentorum ut et Petitiones et Placita in Parlamento*.

F. C. M.

**PARNELL, HENRY BROOKE** (1776-1842), afterwards first Baron Congleton, the son of Sir John Parnell, was educated at Eton and Cambridge, which he left without taking a degree, and entered the Irish parliament as member for Maryborough in 1797. In 1802 he represented Queen's County in the first parliament of the United Kingdom, and soon, either through natural leaning or some force of circumstances, began to associate himself with movements of an economic character. On 18th April 1809 he introduced a resolution for assimilating IRISH CURRENCY (*q.v.*) to that of the rest of the United Kingdom. On 19th Feb. 1810 he became a member of the **BULLION COMMITTEE**. He was chairman of the select committee of 1813 to inquire into the corn trade of the United Kingdom. In July 1819 he brought forward serious retrenchment resolutions; he had somewhat severe ideas of public economy, and when he became

secretary at war, 4th April 1831, made such a point of reducing the army estimates, that his colleagues had to part with him, and he relinquished his office in 1832. Nevertheless he returned to office under Lord Melbourne on 14th May 1835, as paymaster-general. He committed suicide in 1842.

His best-known work is that on *Financial Reform*, London, 1830. His main contention is that the public expenditure was overgrown, and that, especially in the non-productive services, considerable reductions could be effected. Of his other economic works the principal were, *Observations on the State of the Currency in Ireland*, Dublin, 1804.—*Principles of Currency and Exchange, illustrated by observations on the State of Ireland*, Dublin, 1805.—*A Treatise on the Corn Laws and Agriculture*, London, 1809.—*Observations on the Irish Butter Acts*, London, 1825.—*Observations on Paper Money, Banking, and Overtrading*, London, 1827.—*A plain statement of the Power of the Bank of England and the use it has made of it* (published anonymously), 1832.—*A Treatise on Roads*, London, 1833.

[*Dictionary of National Biography.*] C. A. H.

**PARQUET** (Fr. an enclosure). On public boures the railed-in space within which the privileged brokers or *agents de change* (see **CHANGE**, **AGENTS DE**) carry on their operations; the word is also employed to distinguish the official market from the outside market or **COULISSE** (*q.v.*). By extension the two words are applied to the business itself, for example, "the *parquet* was weak, the *coulisse* firm," many securities being dealt in on both. In legal phraseology the *parquet* is the office of the public prosecutor in the law courts, or the officers appointed by the minister of justice to set in motion the action of the law in criminal affairs or in civil proceedings when they are matters of public policy.

**PARSIMONY.** See **THRIFT**.

**PARTICULAR AVERAGE.** The losses provided against by marine insurances are "total loss" and "partial loss."

Partial loss is either a "*general average loss*" or a "*particular average loss*." *Total loss* is either *actual* or *constructive*. When the subject matter is destroyed or irreparably damaged, or when the assured is irretrievably deprived thereof, there is an "*actual total loss*" (Marine Insurance Bill, § 57 [1]). A "*constructive total loss*" is, on the other hand, said to arise (a) in the case of a ship, when the insured ship is so damaged that the expense of repair would exceed the value of the ship when repaired; (b) in any other case, when the subject matter is so damaged, or affected by a peril insured against, that, having regard to cost, it is not reasonable to require the adventure to be prosecuted to its termination (Marine Insurance Bill, § 60).

*General average* arises whenever part of the cargo is sacrificed, or some expenditure is incurred

for the benefit of the ship and cargo generally, *e.g.* when goods are thrown overboard for the purpose of lightening the ship. The value of the lost goods or the amount of the expenditure is, in such a case, made up to the person concerned by contributions payable by the owners of the ship and cargo in proportion to the value of their respective interests, and they in their turn, if the insurance covers general average, are reimbursed by the underwriters. A "particular average loss," on the other hand, is a partial loss which falls on the owner of the goods affected by it exclusively (*e.g.* damage done to goods by sea-water is a particular average loss, unless the goods are so badly damaged that a case of "total loss" arises, in which event the goods are handed over to the underwriters, and the assured receives the full amount of the insurance).

In many cases it is doubtful whether a total loss may be claimed for, or whether there is only a claim for compensation under the head of particular average.

If the claim is made in respect of "constructive" total loss, notice of abandonment must be given within the usual time, and the underwriters have then to determine whether they will admit or contest the claim, and in the event of the parties not being able to agree, the question must be decided by arbitration or litigation.

A policy drawn up in the ordinary form contains the following clauses:—

"(a) Corn, fish, salt, fruit, flour, and seed are warranted *free from average*, unless general, or the ship be stranded.

(b) Sugar, tobacco, hemp, flax, hides, and skins are warranted *free from average under £5 per cent.* And also—

(c) All other goods, also the ship and freight, are warranted *free from average under £3 per cent.* unless the ship be stranded."

This means that, except in so far as the common-form policy is varied by special agreement, the underwriters do not insure the goods mentioned under (a) against particular average in ordinary cases, but that if the ship be stranded, particular average is insured against; that the goods mentioned under (b) are not insured against particular average unless it diminishes the value of the goods to an extent exceeding 5 per cent of the insured value; and that all goods not mentioned under (a) and (b) are insured against particular average diminishing their value to an extent exceeding 3 per cent, and against particular average of any sort arising in the event of the ship being stranded. In modern commercial usage an insurance which covers total loss, general and particular average is called an insurance "against all risks," and an insurance against total loss and general average only is called *f. p. a.* (free of particular average).

[Smith, *Mercantile Law*, ed. by Macdonell, 10th edition, 1890.—Gow, W., *Marine Insurance*, Macmillan, 1893; and see the Marine Insurance Bill, intended to codify the law of marine insurance.]

## PARTNERSHIP.

Partnership, History of, p. 65; Partnership, Canonist Theory, p. 68; Partnership, Form of, as Commandite p. 68; Partnership, Industrial, p. 69; Partnership, Law of, p. 69; Partnership, Mediæval, p. 71.

**PARTNERSHIP, History of.** Sir Henry Maine's statement, *Ancient Law*, p. 170, that the progress of society leads to the substitution of contractual relations for relations imposed by those natural and legal conditions affecting individuals which are known under the name of *status*, is borne out by the history of the law of partnership. Some form of association for economic purposes seems to have existed in very remote times. Tablets inscribed with cuneiform characters have been discovered which show that associations established for mercantile purposes and trading, under a kind of trade-name, existed in Assyria more than twenty centuries before the present era, and the principle of uniting funds for common objects was well known in ancient Greece. Gaius refers to a law of Solon (see Justinian's *Digest*, 47, 22, 4), in which the objects are named for which autonomous societies existed. They include trade (*εἰς ἐμπορίαν*) as well as the less creditable occupation of piracy (*ἐπὶ λεῖαν οἰχόμενοι*).

There is also a well-known passage in Aristotle (*Eth. Nic.* viii. 11), in which such associations (*κοινωνίαι*) for a common object are mentioned, the object being either the prosecution of gain or some convivial or domestic purpose such as the sharing of meals, the members in that case being called *σύσσιτοι*, and a certain class of societies known as *ἐπανοί* are referred to by some of the Attic orators (see Meier and Schömann's *Attischer Prozess*, edited by Lipsius, 1883-1887, pp. 637-643). Information about oriental and Greek partnerships is, however, too scanty to enable us to form an opinion as to their origin and history.

It is only when we proceed to examine the legal history of the Roman republic and empire that more reliable data are discovered, and from these it is clear that the Roman *Societas* in its original form was not the result of contract, but of natural ties. Roman family relations must always be looked on from two aspects. The "agnatic" family is an economic unit under the authority of a head, in whom the property is vested and under whose *potestas* all the members of the family are placed. Emancipated sons and married daughters brought under another man's *potestas* cease to belong to the agnatic family. On the other hand, the "cognatic" family comprises all the children, and their issue without reference to *potestas*; it is not a unit for economic purposes, but its

members are held together by various ties, one being the respect, *obsequium*, due to the common ancestor.

Thus it comes that even after the death of the father, brothers and sisters are held together; they remain members of the cognatic family which is called the *secta*, a word derived from the same root as *obsequium* and *exsequiae*—which latter expression denotes the funeral rites which the cognatic family had to attend to, on the ancestor's death—and is also etymologically connected with *societas*, and as the father's estate was generally bequeathed to them as tenants in common (though the right of the cognates to inherit was established at a later period only), they frequently found it convenient not to divide the property, but to administer it for their common advantage. When property was left to several persons as tenants in common, the individual shares were generally ascertained by lot; hence the Greek word for inheritance is *κληρονομία*—that which is ascertained by lot; the division by lot is also indicated in the Latin word *consortium*, but that word also shows that it was customary to keep the parts together. Thus brothers and sisters who, having in their father's lifetime been members of the same *secta* or *societas*, were also called *socii*, frequently kept the inherited property together, and used or traded with it for their common advantage.

Another instance of common ownership under the name of *societas* is also of importance in connection with our subject. In the same way as the emancipated children were bound together by the common tie of *obsequium*, the slave who had received his freedom owed this *obsequium* to his former master. One of the ways to enforce this duty was to impose the condition that, on its being neglected, the master should be entitled to a share in the freedman's goods, which in that event were held in common by the *patronus* and *libertus* in the same way as inherited property was held in common by the *fraternum consortium*; the name *societas*, which, as shown above, was derived from the family relation, was also applied to this relation, which was one of contractual partnership.

But the voluntary association of several persons to carry on business on joint account was not immediately evolved out of the types of association to which we have referred. A third class of *societas* began to be formed at the time of the second Punic War for the purpose of contracting for the supplies to be furnished to the Roman army (see Livius, xxiii. 48 (539)), and the societies who farmed the state revenues, *rectigallum publicorum socii*, were also organised on a similar plan. These societies, known by the collective name of *societates publicanorum*, had corporate rights, and differed therefore from partnerships in the ordinary sense, but they no doubt called attention to the possibility of joining funds for purposes of profit.—For

fuller information on the early history of partnerships and trading societies in Rome, see Leist, *Geschichte der Römischen Societas*, from which work the information given above is mainly derived.

There were therefore two kinds of association known during the times of the Roman republic: the one resulting from natural ties, being either the *fraternum consortium* or the common ownership in the goods of a freedman who had neglected the *obsequium* due to his *patronus*; the other resulting from voluntary association for purposes of gain, but being more like a trading corporation than like a partnership. During the classical period of Rome, which began soon after the foundation of the empire, associations began to be formed of a private nature, and partaking of many legal characteristics of the ancient family societies, but entirely voluntary, and established for purposes of gain like the above-mentioned trading corporations. At this later stage all partnerships were the result of contract, and we see from an enumeration made by Ulpian (about 200 A.D.) that they referred either to the whole of the present and future property of the partners, *societates omnium bonorum*, or were entered upon for some particular transaction, *negotiationis alicujus*, or for farming taxes, or for the joint management of one particular object of property, *societates unius rei* (see Justinian's *Dig.* 17, 2, 5). Paulus, one of Ulpian's contemporaries, gives an instance of a professional partnership ("duo societatem coierunt ut grammaticam docerent et quod ex eo officio quaestus fecissent, commune eorum esset," *Dig.* 17, 2, 71). The legal characteristics of private partnerships as distinguished from trading corporations are at that time clearly recognised (see the quotation from Pomponius, *Dig.* 17, 2, 59, and see also *Dig.* 3, 4, 1, pr.), and it is also pointed out by the jurists of that period that not all the partners need necessarily contribute capital, as a partner's work may entitle him to a share of the profits ("saepe enim opera alicujus pro pecunia valet" Gaius, iii. § 149, see also *Dig.* 17, 2, 5, § 1). Much attention was already given to the details of partnership arrangements, such as the division of profits and losses (*Inst.* 3, 25, § 1, § 2 i; Gaius, iii. §§ 149, 150; *Dig.* 17, 2, 29, § 2 i; *ibid.* 17, 2, 30), the degree of diligence required from partners (*Dig.* 17, 2, 72), and the events which cause a partnership to be dissolved (*Inst.* 3, 25, § 5, i; *Dig.* 17, 2, 65, §§ 3, 5; *ibid.* 17, 2, 70). Even minute points, such as the question whether a partner who is wounded in trying to protect the partnership property is entitled to recover his medical expenses from the partnership (see *Dig.* 17, 2, 60, and 61), are discussed with great elaboration. It must, however, be pointed out that, notwithstanding many similarities, the partnership of the classical as well as of the earlier periods of Roman law

is essentially different from the partnership of our days. No broad distinction is drawn in Roman law between common ownership of property and the mere sharing of profits and losses; nor are permanent trading associations distinguished from occasional transactions on joint account. There is no partnership capital kept distinct from the capital of the partners, and no general rule exists according to which a partner has authority to incur liabilities binding his co-partners. Even when he is specially authorised to incur a liability on their behalf, it is doubtful to what extent they are liable (see Windscheid, *Pandekten*, 5th ed. ii. § 407, note 7). In many ways the rules still partake of the character belonging to the older associations between members of the same family, and the influence of the greater freedom of intercourse brought about by the extension of the empire and the increase of wealth is not yet sufficiently felt. The principal reason for this fact is to be found in the continued existence of slavery, which took away many of the motives which in our days induce traders to form partnerships.

A very convenient method of trading was furnished through the instrumentality of the *peculium*, being the property put into the hands of a non-emancipated son, or of a slave, for purposes of trade. The creditors of such son or slave were under the praetor's edict entitled to sue the head of the family in respect of the trade-debts, but the judgment could be enforced only in so far as the judgment debt did not exceed the value of the *peculium* (see the title *De Peculio*, *Digest* xvi.). This rule enabled a master to trade with limited liability through the agency of his slave. It was also possible for several masters to become co-owners of a slave, and carry on a trade in co-partnership through his agency. Each partner was then liable for the trade-debts to the extent of the whole *peculium*, but he was entitled to claim contribution from his co-partners to the extent of the sums which represented their shares (see *Digest* xv., 1, 27, 8). This method of trading with limited liability was not the only one known in Roman law (see Goldschmidt, *Universalgeschichte des Handelsrechts*, vol. i. p. 91), and the entrusting money to others for trade purposes, which frequently brought about a similar relation, was in the language of later latinity called *commendare* (from *cum-mandare*, *mandare* being derived from *manui dare*; as to the mediæval applications of the word, see Ducange, *Glossarium*). The form of partnership known as *commenda* in mediæval law was therefore known already by the same name in earlier times.

When the mercantile cities of Italy—among which Venice, Pisa, and Genoa began in the 9th century to be prosperous—established a large maritime trade, the *commenda* (viz. the

relationship in which there is an active partner liable without limit, and a capitalist partner whose risk is limited to a fixed sum) became a favourite form of association. It was in the beginning merely of a temporary nature, and used by capitalists who wanted to join in some particular maritime enterprise with a limited risk, but in course of time it was also applied to internal trade, and more permanent relations between the capitalists and active traders became customary. Thus the large financial houses of the Bardi and Peruzzi in Florence, who lent 1,365,000 gold florins to Edward III., traded as to part only with their own money, whilst the bulk of their capital was furnished by commandite partners and depositors, *avendo in accomanda ed in deposito di piu cittadini e forestieri* (Villani, quoted by Troplong, *Traité de la Société*, vol. i. p. 66).

Thus the prototype of the modern *société en commandite* was in the early part of the middle ages the most important form of association, but the partnership of modern times, in which all partners are liable without limit for the partnership debts, traces its pedigree from more humble progenitors. Like the Roman *Societas*, it originated in the family community in which a small trade or handicraft was carried on by the persons eating their bread together (*cum-panes* = *σύντροφα*, from which word the expressions *Company* and *Compagnon* are derived). The trade of these family associations was carried on in a common workshop, or warehouse, known by some well-known sign which was used as a comprehensive designation of the persons using it as the centre of their operations. Hence arose the use of firm names, and the personification of the mercantile unit, represented by the sign of the house, as well as the custom to recognise every partner as agent for the partnership.

The names of the partners were entered in the books of the guilds representing the trade to which they belonged, which guild registers served as the foundation of the registers of firms in use in most continental countries. In these partnerships, for the first time, the partnership capital, which—in connection with the original character of the joint establishment, was looked on as a common fund not accessible for the partners' private purposes—was kept strictly separate from the separate capital of the partners. Originally only the partnership capital was liable for the partnership debts, and it was only gradually that the unlimited liability of the partners' separate capital became customary. (For further particulars of the development see Goldschmidt, *l.c.* pp. 271-290). The custom of trading under a firm, and with a partnership capital, was subsequently also adopted by voluntary associations not bound together by any family tie, and partnerships trading with unlimited liability began in the 16th century

to assume the same importance as the commandite partnerships, which in the early parts of the middle ages had monopolised all other branches of trade (see Goldschmidt, *op. cit.* pp. 289-290; on the whole development, see also Lastig, "Allgemeine Uebersicht," in Endemann's *Handbuch*, pp. 329-332, and the authorities there cited).

Thus it came about that, like in ancient Rome, the partnership formed by natural ties and founded on *Status*, preceded and established the characteristics for contractual partnerships.

The development of trade finally produced the third type of mercantile association, which we also noticed in the Roman development. Companies enjoying corporate rights, and trading with a capital divided into shares—which shares, unlike shares in ordinary partnerships or commandite partnerships, were transferable by contract and transmissible on death,—existed in Italy at a very early period under the name of *monte* (the expressions *massa* and *maona* are also used). They are associations of capitalists who advanced funds to governments, and in return received certain trade privileges. The oldest of these associations was established for temporary purposes only, but in 1346 the Genoese *maona* of Chios and Phokaea, also known as *Maona dei Giristini*, received a more permanent organisation. In return for a loan required by the city of Genoa for an expedition undertaken by Simon Vignos and others, the exploitation of Chios and Phokaea was entrusted to this company under the suzerainty of the Genoese state; they also obtained important trade monopolies, and the company continued to have an independent existence until 1513, when it was purchased by the well-known *Monte delle compere e dei banchi di S. Giorgio* of Genoa, the first fully organised banking company, which was founded in 1407, and continued to exist until the extinction of the republic of Genoa (see Goldschmidt, *op. cit.* pp. 295-297).

In England the ground for the trading companies was prepared by the merchant adventurers (see ADVENTURERS, MERCHANTS; COMPANIES, STAPLE), and companies similar to the Italian companies, mentioned above, are to be found regularly from the middle of the 16th century, but the establishment of companies with permanent objects is of a somewhat later date. The EAST INDIA COMPANY (*q.v.*), founded in 1600, is one of the earliest English permanent companies. These companies were all incorporated by royal charter, and the possibility of acquiring corporate rights by virtue of a general act was established during the present reign only.

[As to the modern development of English company law, see Lindley on *Company Law*, pp. 2-7; 923-930. Besides the books referred to in

the text the following deserve mention: Goldschmidt, *Alte und neue Formen der Handelsgesellschaften*.—Silberschmidt, *Die commenda*.—Schmidt, *Handelsgesellschaften des Mittelalters*.—Endemann, *Studien in der romanisch-kanonistischen Wirtschafts- und Rechtslehre*.—Lastig, *Entwicklungswege und Quellen des Handelsrechts*.—Weber, *Zur Geschichte der Handelsgesellschaften im Mittelalter*.—Lattes, *Il diritto commerciale nella legislazione statutaria delle città Italiane*.—Pappenheim, "Altnordische Handelsgesellschaften" in *Zeitschrift für das Ges.-Handelsrecht*, vol. xxxvi. pp. 85-123.—Adler, *Zur Entwicklungslern und Dogmatik des Gesellschaftsrechts*. See also the articles by Lastig and Wendt in Endemann's *Handbuch*, vol. i. on pp. 310, §§ 343, 428.] E. S.

**PARTNERSHIP, CANONIST THEORY.** The phenomena of business partnership (*SOCIETAS*) presented themselves for judgment before the schoolmen and canonists of the middle ages, chiefly in their relation to the theory of usury (see INTEREST AND USURY). A partnership wherein each member shared in the management of the business raised no difficulties: the profit (*lucrum*) might in such a case be regarded as the reward of labour. Not only so, but a partnership in which some of the members contributed capital only, without labour, and yet expected profit, was regarded as equally allowable,—on one condition, viz. that the investor really "adventured," i.e. really shared in the "risk," both as regards the sum invested and the gain to be derived from it. The running of risk was held both to furnish an ethical justification for gain, and also to prove that the investor remained the *owner* of the sum invested, so that the contract was clearly distinguishable from one of LOAN (*q.v.*) or MUTUUM, in which the ownership of the money was held to pass over to the recipient. Any attempt by subsidiary contracts to assure the investor against the loss of his capital, or to guarantee a profit independent of the chances of trade, brought the arrangement within the scope of the prohibition of usury.

[The passage in AQUINAS, *Summa Theologiae*, Secunda Secunda, Qu. 78, Art. 2, was the starting point of subsequent discussion. A very elaborate treatment of *Societät* will be found in the first vol. of W. Endemann's *Studien in der romanisch-kanonistischen Wirtschafts- und Rechtslehre* (1874); on which, with some attempt to correct its bias, is based the account in ASHLEY, *Economic History*, vol. i. pt. ii. (Amer. ed. vol. ii.) pp. 419, 420. (See also PARTNERSHIP, MEDIEVAL.)] W. J. A.

**PARTNERSHIP, FORM OF, AS COMMANDITE.** A partner is as a rule liable jointly with his co-partners for all debts of the firm; and after his death his estate is liable for such debts subject to the prior payment of his private debts.

It has been thought desirable to introduce forms of partnership in which a person might contribute capital and receive a share of the

profits without at the same time incurring unlimited liability towards creditors. The Partnership Act of 1890, embodying the provisions of "Bovill's Act" passed in 1865, recognises this principle, and states that the receipt of a share of the profit of a business or of a payment contingent on or varying with the profits, does not of itself make such person a partner. But whilst these provisions only relate to private arrangements, which may at any time be altered or cancelled between the parties, subject however to the restriction that, in the event of bankruptcy, a person entitled to a share of profits, but not being a partner, cannot prove in competition with other creditors, the form of partnership known as "Limited Partnership" and *société en commandite*, and used in most mercantile countries, including the United States, gives effect to the principle referred to in a much more consistent manner. In a commandite partnership, there are one or more partners managing the affairs of the firm, and liable to an unlimited extent, who are called "general partners," and one or more dormant partners, who are called "special partners" (*commanditaires*), who are only liable to a limited extent. The amount for which they are liable, and the time during which the liability continues, must be registered and published, and no arrangement between the partners varying the registered agreement can affect the creditors of the partnership.

Owing to the spread of limited *Companies*, commandite partnerships have in all countries come very much into disuse, and the fact that the provisions of the British Companies Act 1867, § 4, which allows limited companies to be formed in which the managers or directors are liable to an unlimited extent, have remained a dead letter, shows that in British countries there is no real demand for "commandite" partnerships.

[See *Revised Statutes of the State of New York*, pt. ii. ch. iv. title 1.—*French Code de Comm.*, §§ 23, 28, German *M.C.*, §§ 150-206, Italian *M.C.*, §§ 114-120; Spanish *M.C.*, §§ 145-150; Portug. *M.C.*, §§ 104, 113, 114, and other *Mercantile Codes*.]

J. E. C. M.

**PARTNERSHIP, INDUSTRIAL.** See PROFIT SHARING.

**PARTNERSHIP (LAW OF).**<sup>1</sup> Partnership in the widest sense means every association for common purposes, and in a somewhat narrower but still comprehensive application, it means every association for purposes of gain. In the strictly legal sense the word is, however, of more limited import. In all countries partnerships are distinguished from incorporated *companies* (see COMPANIES; JOINT-STOCK

COMPANIES; STANNARIES). Subject to that exception, a partnership in the United Kingdom, as well as in such parts of the British empire in which the P. A. has come into force, is defined to be in (§ 1) as "the relation which subsists between persons carrying on a business in common with a view of profit," the word "business" including, according to the definition given by § 45 of the same act, "every trade, occupation, or profession."

English law does not distinguish between mercantile and other partnerships, as some of the continental codes do, in which non-mercantile partnerships are governed by rules differing in many important respects from the rules governing mercantile partnerships. This is more especially the case with reference to the liability for the partnership debts, which in the case of mercantile partnerships extends to the whole debts for each partner, whilst in the case of non-mercantile partnerships the partners are liable in equal shares, no partner being liable beyond his share (see for instance F. C. C. §§ 1862 and 1863); but there are many other matters in respect of which non-mercantile partnerships, which in Germany include professional partnerships and partnerships between innkeepers, artisans, and small tradesmen generally, are, according to continental law, not governed by the rules applicable to mercantile partnerships (see G. M. C. §§ 85 and 10; F. C. C. act 20, art. 1, and the decisions thereon; and the I. C. d. C. art. 76, and art. 3-7).

In the United Kingdom one kind of mercantile partnership only is known, *i.e.* that in which all partners are liable for the partnership debts without limit. A person may—under the law originally laid down by the House of Lords in *Cox v. Hickmann* (8 H. L., C. 268), and subsequently declared by Bovill's Act, now re-enacted with certain slight alterations by P. A. 1890, § 2 (3)—have a share of profits without being a partner, but all partners are liable without limit. On the continent, on the other hand, there is a form of partnership called *société en Commandite* (see G. M. C. § 150; F. C. d. C. § 23; I. C. d. C. §§ 76, 117), in which one or several of the partners may limit their liability, whilst one at least of the other partners is liable without limit. The limited partners may divide their interest in the partnership capital into shares, in which case the partnership has some of the characteristics of a company, and is called *société en Commandite par actions* (see G. M. C. § 173; F. C. d. C. § 38; I. C. d. C. §§ 119 and 120) (see PARTNERSHIP, FORM OF, AS COMMANDITE). It was intended to introduce commandite partnerships with a share capital into the United Kingdom, and the provisions of C. A. 1867, § 4, are quite sufficient for the purpose; but it does not seem that any one has ever attempted to apply them. There is finally a form of partnership which exists in

<sup>1</sup> The following abbreviations are used throughout this article:—B. A. = Bankruptcy Act 1883; C. A. = Companies Act; F. C. C. = French Code Civil; F. C. d. C. = French Code de Commerce; G. M. C. = German Mercantile Code; I. C. d. C. = Italian Codice di Commercio; P. A. = Partnership Act 1890.

Germany, by virtue of a statute passed in 1892, in which all the partners are liable to a limited extent only (*Gesellschaft mit beschränkter Haftung*). This form of partnership is distinguishable from a limited "company" in various ways, but in the United Kingdom its place is taken up by "private companies," which are companies in the full sense, but have generally some provisions in their articles by which the more private character of the association is secured (*e.g.* clauses providing that shares cannot be sold without being offered to the shareholders).

According to English law a partnership established for banking having more than ten, and any other partnership having more than twenty members must, unless it belongs to certain privileged associations specially dealt with by statute, be incorporated as a company under the C. A. or by special act or by special charter (C. A. 1862, § 4). On the continent, on the other hand, there is no restriction as to the number of partners in private partnerships.

Persons who have entered into partnership are collectively called a FIRM (*q.v.*). In England the firm is only looked on as a collection of persons who have joint rights and joint liabilities, but in Scotland a firm is a legal person distinct from the partners of whom it is composed (P. A. 1890, § 4), and this is also the theory of French law. As it is now possible in England to bring and defend actions in the firm's name (R. S. C. 1891, Order xlviii. A. r. 1), the distinction has lost most of its importance.

One of the principal incidents of the partnership relation, which, in those continental countries in which mercantile partnerships are distinguished from others, attaches to mercantile partnerships only, is by the P. A. 1890, § 5, described as follows:—"Every partner is an agent of the firm and his other partners; and the acts of every partner who does any act for the carrying on in the usual way of business of the kind carried on by the firm of which he is a member, bind the firm and his partners, unless the partner so acting has in fact no authority to act for the firm in the particular matter, and the person with whom he is dealing either knows that he has no authority or does not know or believe him to be a partner." Where, however, one partner pledges the credit of the firm for a purpose apparently not connected with the firm's ordinary course of business, the firm is not bound, unless he is in fact specially authorised by the other partners (*ib.* § 7). On the continent, restrictions in a partner's implied authority are binding on third parties, although unknown to them, if entered on the register (see G. M. C. §§ 115, 86, 87; I. C. d. C. §§ 88, 90).

The question as to who is or who is not a

partner in a firm is also of easier solution on the continent than in the United Kingdom, as a person registered as partner in a firm on the mercantile register is, as between himself and third parties, estopped from denying that he is a partner (G. M. C. § 25; I. C. d. C. §§ 103, 88; French St. 24th July 1867, §§ 55, 57, 61). In the countries governed by British law, registers of firms are not used, and it is therefore necessary to inquire into the exact facts in order to find out whether any given person may be treated as a partner or not, but persons "holding themselves out" as partners may be made liable as such, although they are not partners in fact (P. A. 1890, § 14).

The internal affairs of a partnership are generally arranged by contract between the partners. In the United Kingdom, a written contract is not required unless the duration of the partnership is to extend over a year, and in Germany a written contract is unnecessary in any event (G. M. C. § 85), but in France and Italy a written contract must be registered in all cases, and certain parts of it, including statements as to the names of the partners, the trade name, the authority of the partners to act for the firm, the duration of the partnership, and the amount of the partnership capital, must be published in certain newspapers (F. C. d. C. §§ 39, 41; St. of the 24th July 1867, § 57; I. C. d. C. §§ 87, 88, 90, 93).

The codes relating to the law of partnership contain regulations as to the rights in respect of the partnership property, the sharing of profits, the interests payable on advances of capital, the duty of partners not to carry on business in competition with the firm, the powers of majorities, the expulsion of partners, the duration of partnerships, and other matters (see P. A. 1890, §§ 19, 31; G. M. C. §§ 90-109; F. C. d. C. § 18; I. C. C. §§ 1707-1725; C. d. C. §§ 107-113) which have to be applied in the absence of contractual stipulations to the contrary.

The procedure to be adopted for the purpose of recovering partnership debts by execution against the property of individual partners, or the estates of deceased partners, is too complicated to be discussed in this place (as to the U. K. see P. A. § 9, and *Kendall v. Hamilton*, 4, Ap. c. 504; as to Germany, M. C. § 112; as to France, C. d. C. §§ 22, 64; C. C. §§ 1200, 1202; as to Italy, C. d. C. §§ 76, 206; C. C. §§ 1186, 1189). The rules in this matter are, in the view of English courts, mere matter of procedure, and must therefore be decided by the law of the place in which the action is brought, without reference to the law of the place in which the partnership business is carried on (*in re Doetsch* [1896] 2. ch. 830).

In case of bankruptcy the partnership creditors are, in the United Kingdom and Germany, entitled to the partnership property, and the

separate creditors of any partner are entitled to such partner's separate property. If any surplus remains in either case, such surplus is available for the partnership creditors, or the separate creditors, as the case may be (B. A. 1883, § 40 (8); G. M. C. § 122).

From an economic point of view the regulation of partnership law by rules adapted to the usages and requirements of mercantile life, is of great importance, as in consequence of such regulation the formation of partnerships and more especially their dealings with other traders and with each other, are considerably facilitated. The disadvantages of trading without partners are so obvious that they hardly require mention, but the comparison between partnerships and companies is more difficult. For those classes of business in which the personal capacities of the managers are of great importance, private partnerships may appear preferable, as they are more likely to retain permanent customers, but even in this respect much may be said on the other side, as the vicissitudes of health and the uncertainty of life make it impossible to rely with confidence on the continuance of the personal qualities which, in a given case, make it desirable to transact business with a particular firm, whilst on the other hand a company is more likely to be able to replace a capable manager by one equally capable, who, by having previously assisted his predecessor, will continue to work in the same manner.

In a private partnership there is, of course, a greater possibility for sons to continue in the footsteps of their father than in a company, and the continuance of firms by successive generations of the same family has many obvious advantages from a public point of view; but these advantages were much greater when the mercantile classes were socially distinct from the leisured classes. In our days a share in the family business is frequently looked on as property not involving any duties, enabling the owner to share the life of those who in former days would not have associated with persons deriving their income from "trade," and in such a case the advantages of the business traditions of the family must soon disappear.

The greater privacy of private partnerships may be more advantageous for the preservation of trade secrets, but, with proper precautions the same result may be secured by a company.

The risks and disadvantages of trade being carried on by companies as distinguished from private partnerships have been frequently discussed. In a company there is nobody whose personal honour is affected by failure, and the persons who have a directing voice in the management do not necessarily suffer from the consequences of their carelessness or recklessness, and may be even benefited by the disasters of their company. The risk attendant on this

circumstance may be lessened by legislation (see JOINT STOCK COMPANIES), and also by the education of public opinion which hitherto has been much too lenient in respect of the deficiencies of company directors, except in a few conspicuous cases, in which there were sensational features of a special kind.

But whether it be for good or for evil, it must be clear to any intelligent observer that private partnerships and unlimited liability are rapidly disappearing, and under these circumstances it is hardly worth while to propose any legislative reforms of partnership law; but an act providing for the compulsory registration of firms, and thus enabling creditors to ascertain who at a given moment are the partners in the firm with whom they are dealing, would be of great advantage, and could be introduced without much difficulty. The introduction of "commandite" partnerships at one time much discussed by reformers of partnership law, would probably be without any practical effect; if there was any real want for this form of partnership it could be easily supplied by taking advantage of the above-mentioned provisions of C. A. 1867, § 4. In the event of company law being made more stringent, it will probably be desirable to find a special form of association to facilitate trading with limited liability without the necessity of the restrictions which would then be imposed upon the formation and management of public companies (see as to this, paragraphs 65 and 66 of the *Report of the Departmental Committee of the Board of Trade on the Companies Acts published in 1895*), and for this purpose the introduction of private partnerships with limited liability similar to those established under the above-mentioned German statute of 1892 would be convenient.

[As to continental law, see the art. "Sociétés Commerciales," *Continental Mercantile Codes*.—Also Troplong, *De la Société*.—Delaunay, *Traité des soc. commerciales franç. et étrangères*, 2 vols. 1882.—Houpin, *Traité général théorique et pratique des Sociétés Civiles et Commerciales*, 2 vols. 1895.—Hergenhahn, *Das Reichsgesetz betreffend die Ges. mit beschr. Haftung*, 1895.—See also the articles under the heading: "Die Handelsgesellschaften" i. to iii. in *Endemann's Handbuch*, vol. i. pp. 310-357. As to English and Scotch law, see Lindley, *Treatise on the Law of Partnership*, 6th ed. 1893.—Pollock, *Digest of the Law of Partnership*, 6th ed. 1895.]

E.S.

**PARTNERSHIP, MEDIEVAL.** The modern practice of partnership has a threefold root in mediæval usage. (1) The oldest form of partnership in the middle ages took its origin from Italy, and was known as *commenda*. This implied the handing-over, for a particular voyage or enterprise, of goods or money by one person who remained at home (*commendator*, *socius stans*) to another who undertook the management of the business (*commendatarius*,

tractator). The *commendatarius* was commonly rewarded with one-fourth of the gain. In the later centuries, the *commendatarius* usually contributed capital himself, and acted on behalf of a number of *socii stantes* or sleeping partners. It was in this way that most commercial undertakings were conducted which involved considerable capital; and the practice survived in the *société en commandite*, so general to-day on the continent of Europe (see *COMMANDITE*, *SOCIÉTÉ EN*).

(2) The joint household of brothers, relatives, or friends, "eating one bread" (*companis*), and engaged in the same industry, was apparently the direct parent of the ordinary private partnership of modern England and the *offene Gesellschaft* of modern Germany, and seems to have given them the characteristic of unlimited liability which distinguishes it from the *société en commandite*.

(3) The mechanism of the modern joint-stock company, however, may be traced back in large part to the GILD. The earliest joint-stock companies, like the English EAST INDIA COMPANY, had in every respect, except the joint-stock, the same organisation as the earlier companies of "adventurers" in foreign trade. These latter were modelled on the great town "crafts" or "companies," like those of the mercers or grocers; and these, in their turn, had but followed the example of the earlier merchant and craft guilds. In all these, though there was a small fund for certain common religious and social purposes, and various restraints were imposed on the economic action of members, each member traded on his own account and with his own stock. Even the East India Company began with a joint stock only for each voyage, and did not for some years create a permanent joint stock. The introduction of a joint stock was immediately due to the lessons of experience, but the forms adopted for the purpose were probably influenced by contemporary practice in the matter of government loans (see also *PARTNERSHIP*, *LAW OF*; and *PARTNERSHIP*, *HISTORY OF*).

[The most complete information on the subject will be found gathered together in the *Universalgeschichte*, forming vol. i. of L. Goldschmidt's *Handbuch des Handelsrechts* (new ed. 1891), where are also given abundant references to the literature. Among recent special monographs should be mentioned W. Silberschmidt, *Die Commenda in ihrer frühesten Entwicklung* (1884), M. Weber, *Zur Geschichte der Handelsgesellschaften im Mittelalter* (1889), and F. G. A. Schmidt, *Handelsgesellschaften in den deutschen Stadtrechtquellen* (1888). On these works is founded the account in Ashley, *Economic History*, vol. i. pt. ii. § 67. See also Parsons, *Principles of Partnership* (Boston, 1889), §§ 2, 3, 26; Troplong, *Du Contrat de société* (1843); Frignet, *Histoire de l'association commerciale jusqu'aux temps présents* (1868).] W. J. A.

PARUTA, PAOLO (1640-1698), a Venetian

nobleman; a clear-headed political writer and historian of the Venetian republic. His work, *Della perfezione della vita politica*, discusses wealth, and, in opposition to socialistic views, defends private property.

Whilst other authors of his day considered wealth solely from a moral point of view, Paruta recognised also an economic side to it. He does not confuse the desire for wealth with the unrestrained longing to accumulate, nor is he biased by preconceived ideas of ascetic morality which other writers of his day had inherited from the canonists (see *CANON LAW*). He considers man's desire to live and to improve his social position to be a right desire based on natural instinct. Therefore, that which other writers of his time condemned, Paruta considered only human and moral.

In the work we quote, Paruta defends private property, combats communism, and shows the impossibility of absolute equality, confuting the numerous writings, the outcome of the sad conditions of the times, which advocated reform based on communism. The law-giver, says Paruta, cannot equalise the wealth of citizens, because this would destroy liberality. It would not be reasonable that the most worthless citizen should be on the same level for wealth as the worthiest. This happens even now, he observes, but being due to chance and not to the law, is more easily tolerated. It would, in any case, be impossible to preserve equality if it were established, and it would necessarily bring about the community of goods and children, upheld by Plato, and lead to most serious troubles.

The real remedy, according to Paruta, is to distribute honours and taxation so that all may share in them according to their status, while educating all citizens to make a good use of their wealth, and abolishing gambling, usury, and all useless occupations. Further, while Paruta defends property, he objects to excessive concentration of possessions.

*Della perfezione della vita politica di M. Paolo Paruta, nobile Vinetiano*, Venetia, 1599.

U. R.

PASCOLI, LEONE (18th century). Born in Perugia, an abbé and a considerable writer on economic subjects, too soon forgotten. In his book, written 1728, published anonymously 1733 at Perugia, untruly dated from Colonia, Pascoli anticipated the economic financial reforms attempted later by Pius VI. in the papal states.

Pascoli follows BOISGUILBERT, deriving from him the title of his principal work, and proposing protection for agriculture, but he does not absolutely repudiate mercantilism, his leanings towards which are shown in his

monetary policy which was designed to cause more coin to be brought into the country than left it. To secure this, trade was to be fettered, that the nation might preserve its economic independence and not waste its money on luxuries.

Pascoli's work has special regard to the condition of the pontifical states which he sought to improve. He proposes plans to raise agriculture and industry again to a flourishing condition, and he discusses the supply of food, trade, coinage, and finance. Free trade internally, free export of agricultural produce to foreign countries, simplification of the system of taxation, constituted the basis of the economic organisation suggested by him. To restore prosperity to agriculture, he proposed to re-establish the ancient privileges granted to cultivators, to release them from all taxes, and to prohibit the import of foreign cattle. He studied the best methods of rendering the Roman Campagna healthy, and maintained that the state should compel land-owners to execute sanitary works. He advocated proportional taxation and special taxes to provide relief for the poor, similar to the English system, prohibition of the export of raw materials, and taxation of imported manufactures.

The title of Pascoli's book is, *Testamento politico di un accademico fiorentino, in cui con nuovi e ben fondati principii si fanno varii e diversi progetti per stabilire un ben regolato commercio nello stato della chiesa, etc.*, Colonia, 1733.

[See, concerning Pascoli, Cossa, *Introduzione allo studio dell' economia politica*, Milan, 1892.—Ricca Salerno, *Storia delle dottrine finanziarie in Italia*, 2nd ed., Palermo, 1896.—Golbi, *La concorrenza estera e gli antichi economisti italiani*, Milan, 1884.—Graziani, *Le idee economiche degli scrittori emiliani e romagnoli*, Modena, 1893.]

U. R.

PASHLEY, ROBERT (1805-1859), barrister-at-law, afterwards Queen's Counsel. In 1833-34 he visited Greece and Asia Minor, and on his return published his *Travels in Crete* (2 vols. 8vo, Cambridge, 1837), a work which was much valued for the statistical knowledge it contained.

Pashley is best known to economists as the author of *Pauperism and Poor Laws* (London, Longman and Co., 1852, 1 vol., 8vo), a work in nineteen chapters, which treats of the subject under the following heads:—The number and cost of paupers in England, and in the metropolis; the pauperism of the agricultural and manufacturing districts; ecclesiastical provision for the poor till the Reformation; pauper legislation before and during the reign of Elizabeth; the relief of the poor from the reign of Elizabeth till the restoration of Charles II.; the statute of Charles II. for the removal of the poor; pauperism from the reign of Charles II. till the end of the 17th century; pauperism and the poor laws of England during the 18th century; the same from 1800-1834; the pauper legislation

of the year 1834; the pauperism and poor laws of England since the passing of the Poor Law Amendment Act in 1834; the effect of the law of settlement on the dwellings of labourers in agriculture; on the necessity of a total repeal of the law of settlement and removal of the poor; the remedy by abolishing removals and substituting relief in money; proposed remedy by union settlement and union rating; other proposed remedies; the author's proposal, which was "that the law of settlement be wholly repealed, that the various provisions for raising and administering relief to the poor be consolidated into one statute; that the yearly sums needed for such relief continue to be raised by parochial rates on real property; that two-thirds of this sum be raised by a pound rate equal throughout the whole country; and the remainder by a further pound rate, raising in every parish a sum equal to one-third of the actual expenditure of such parish (ch. xix. *Pauperism and Poor Laws*).

Pashley also published *Observations on the Government Bill for abolishing the Removal of the Poor* (2nd ed. revised, London, 1854, 8vo).

A. L.

PASLEY, LIEUT.-GENERAL SIR C. W., R.E. (1780-1861), wrote:—*Observations on the Expediency and Practicability of Simplifying and Improving the Measures and Weights and Money used in this Country without materially altering the Present Standard* (8vo, London, 1834).

As the result of his investigations Pasley was made a member of the commission of scientific men, appointed in 1838 to report on the steps to be taken for the restoration of the standards of weight and measure consequent on the destruction of the standard yard by fire at the House of Commons. Pasley assisted in drawing up the report issued in 1841, and in his capacity of commissioner proposed the adoption of the DECIMAL SYSTEM of coinage, preparatory to the introduction of a similar scale of weights and measures.

In his *Plan for simplifying . . . the weights, measures, and money of this country*, a paper read before the British Association at Cheltenham, 12th Aug. 1856, and published 1857, Pasley gave in detail tables of the proposed new measures of length, surface, solidity, capacity, and weight—and (ch. v.) of the new monetary system. He stated the difficulties urged as objections to the proposed decimal coinage; and showed their groundlessness (ch. vi.). In ch. vii. he detailed the advantages of the new system; and, in the last chapter, discussed the objections to the French metrical system: "that it has proved an entire failure as regards astronomy and navigation, and that, instead of proposing uniformity, it has caused greater confusion in the weights and measures of France than ever prevailed before" (ch. viii.).

He also wrote much on military subjects.

A. L.

PASSE-DEBOUT (Fr.). The permit delivered to the carrier of provisions or merchandise passing through a town in which octroi duties

are levied, in transit for a locality outside the limits of the place, or on their way to a market inside the town, and to be taken back if unsold. The amount of the dues is deposited at the gatehouse on entering, and is reimbursed on presentation of the *passé-débout* on leaving. If the amount of the octroi tax is large the escort of an officer from one extremity of the town to the other may be obtained on payment of a fee in lieu of the deposit of the duty. Goods remaining more than twenty-four hours must be lodged in a registered warehouse.

T. L.

#### PASSENGER DUTY. See TAXATION.

PASSY, HIPPOLYTE PHILIBERT (1793-1880) born at Garches-Villeneuve near Saint Cloud, died in Paris. He was born on the very day of the execution of Marie-Antoinette (16th October), his father being in prison as a "suspect," and his mother in hiding. He began life as a soldier—left his military school in 1811, and took part in the Russian campaign as a cavalry officer. He was wounded on several occasions, and on one even left for dead; but he took part in 1814 in the defence of Paris at Montmartre. Leaving the profession of arms, he sailed for the United States. During the voyage the *Wealth of Nations* fell, by chance, into his hands. To pass the time he read the volume, and thus became an economist. His fine intellect served him well in the many high offices he afterwards held. Meanwhile, after his return from America he occupied himself for some ten years in cultivating an estate which he had inherited near Gisors (Eure), and his mind became matured by experience while he enriched it by study. As editor of the *National* of Armand Carrel he was appreciated as he deserved by the able men of various descriptions whom the revolution of 1830 brought to the surface. The district of Louviers returned him to the chamber of deputies. He was minister of finance from the 10th to 18th November 1834 (ministry of Bassano), then minister of commerce from 22nd February to 7th September 1836 (ministry of Molé), minister of finance again from 12th May 1839 to 29th February 1840 (ministry of THIERS). In 1844 he was raised to the chamber of peers. After the revolution of February 1849 had overthrown the monarchy, he became a member of the constituent assembly and afterwards of the legislative assembly; finally, the president of the republic, Louis Napoleon, made him minister of finance on 20th December 1848. He retained this post till 30th October 1849, the date when the prince-president began distinctly to modify his policy. It was during this last occasion of his holding office that he unsuccessfully proposed to levy a tax on the rent of house property as a practical solution of the income-tax. The *coup d'état* definitely put an end to his political career, and from that time

he gave himself up absolutely to economic science. He entered the institute (*Académie des Sciences morales et politiques*) in 1833 as correspondent, and in 1838 as member. He prepared in that capacity many reports, among which may be noticed a paper in 1878, *De l'histoire dans ses rapports avec les sciences sociales et politiques*. A member of the economic society from 1844, he became its second president in 1845, and, on the death of Ch. Dunoyer in 1862, the first president. He was one of the founders of the statistical society of Paris in 1860, was vice-president in the second year, president in 1868, and honorary president after 1873. In all these learned societies his opinion had great weight; this was due both to his force of character and to his twofold gifts as a thinker and a practical man.

Passy wrote, besides his political works: *De l'aristocratie considérée dans ses rapports avec les progrès de la civilisation*, 8vo, 1826.—*Des systèmes de culture et de leur influence sur l'économie sociale*, 8vo, 1st ed. 1846, 2nd ed. 1853.—*Des causes de l'inégalité des richesses*, 18mo, 1849.—*Des formes de gouvernement et des lois qui les régissent*, 8vo, 1st ed. 1870, 2nd ed. (The author supports a constitutional and parliamentary monarchy.)

A. C. F.

#### PATENT AND PATENT LAW.

Patent, p. 74; Historical Observations on Patent Law, p. 75; Specification of Invention, p. 75; Requirements as to Validity of Patent, p. 75; Ditto as to Person of Patentee, p. 75; Investigation by Patent Authorities prior to Grant of Patent, p. 76; Duration of Patents, p. 76; Regulations as to Fees, p. 76; Provisions for insuring working of Invention, p. 76; Provisions for insuring benefit of inventions useful for public purposes to Government Authorities, p. 77; Patent Journals and Patent Libraries, p. 77; International Arrangements, p. 77.

*Patent* is the name for a grant by the government of a country of a privilege enabling the patentee or his licensees to "make use and exercise and vend" the invention, and to restrain any unauthorised person from using or imitating it. A patent is always granted for a limited time and a limited area.

Some economists of authority, among whom PRINCE SMITH (*q.v.*) holds a prominent place, maintain the proposition that the grant of patents is detrimental to the public welfare, but there is now a general consensus of opinion in the opposite direction, it being recognised that it is not only just that inventors should, within certain limits, enjoy a personal benefit from their inventive skill and labour and outlay, but that it is also beneficial to the community that inventions should be encouraged and made.

Modern patent law has contrived numerous safeguards for the protection of the public, among which the limits of time, and the requirements as to publicity, are the most important. The effect of the law is to make the invention public property after the expiration of the patent, and an inventor who has reason to

believe that the secret of his invention can be kept, is in a better position if he does not apply for a patent.

It is worthy of notice that in most countries having a patent law there are certain provisions which are intended to insure that patented articles should be manufactured within the country in which the patent is granted. The granting of patents in this way acts as a protection to native industry.

*Historical Observations.*—It is generally said that patent law was first created by a passage in the statute of James I. abolishing MONOPOLIES (*q.v.*), which, by way of exception, reserved a right to the crown to issue "letters patent . . . for the term of fourteen years or under . . . of the sole working or making of any manner of new manufacture within this realm to the true and first inventor and inventors of such manufactures," and one of the best-known writers on the subject (Kohler in his *Deutsches Patentrecht*, on p. 26) is of opinion that the industrial pre-eminence of England is essentially due to this circumstance. It seems hardly safe to accept the dictum of a legal writer, however eminent, for a proposition of such startling character, and it must also be observed that the statute of monopolies did not create, but only restricted and regulated, the right of the crown to grant patents.

The exception in the statute of monopolies did not, moreover, entitle an inventor to the grant of a patent as of right, but left him dependent on the favour of the crown.

Its principal importance is due to the fact that, for the first time, it recognised a clear distinction between patents for inventions and other monopolies, whilst on the other hand the public interest, which would seriously suffer if patents were granted for an unlimited period, was safeguarded by the introduction of a time limit.

In modern law the right of every inventor, who complies with certain conditions, to enjoy a monopoly for a limited period is almost universally acknowledged, though in some countries (as, for instance, in Denmark, where the first Patent Act was passed in 1894 only) the recognition of this principle is of very recent date. The patent law of the United Kingdom is regulated by the act of 1883. Patent acts were also introduced in the following British colonies and possessions at various dates:—Barbados, British Guiana, British Honduras, Canada, Cape of Good Hope, Ceylon, Hong-kong, India, Jamaica, Leeward Islands, Mauritius, Natal, Newfoundland, New South Wales, New Zealand, Queensland, South Australia, Straits Settlements, Tasmania, Trinidad, Victoria, Western Australia.

*Specification of Invention.*—The grant of a patent is always subject to the condition that the invention should be fully described by the applicant. This is made specially clear by the United States Statute, Rev. Stat., 1874, § 4888; and by the German Statute of 1891, § 20, which requires a description so explicit that experts may by its perusal be enabled to use the invention. The law of the United Kingdom allows a provisional specification to be filed in the first instance, which

must, however, within nine months, be followed by a complete specification (Patent, etc., Act, 1883, §§ 5 (3); 8).

*Requirements as to Validity of a Patent.*—The limits within which inventions are patentable vary in different countries. Novelty, originality, and fitness for industrial purposes are required everywhere, and it is also the universal practice to exclude articles intended for unlawful and immoral purposes (see, for instance, Statute of Monopolies, § 6; French Statute of 1844, §§ 1 and 2; German Statute, § 1; Austrian Statute of 1897 (which will come into force in 1900), § 1, but in some systems of law other articles are excluded as well as those just mentioned. Thus the French Statute (§ 3) excludes all medicines, and the German Statute (§ 1 [2]) excludes articles of food, articles intended for medical purposes, and all substances produced by chemical process.

Most patent laws protect *inventions* only as distinguished from *discoveries* (as to the meaning of the distinction, see Lord Justice Lindley's judgment in *Lane-Fox v. Kensington and Knightsbridge Electric Company* [92], 3 Ch. 424, 428, 429), but the French law protects *discoveries* as well as *inventions* (*toute nouvelle découverte ou invention*), excluding, however, plans and combinations relating to credit and finance (French Statute, §§ 1 and 3).

*Requirements as to Person of Patentee.*—In most countries patents are granted to the "true inventor" only, and in some (*e.g.* in the United States Revised Statutes, 1874, § 4892) the applicant must declare on oath that he is the true inventor; whilst in others, such as Austria (see Austrian Statute, §§ 29 and 4), the first applicant is presumed to be the true inventor until the contrary is proved. The expression "true inventor" is not, however, always construed literally. Thus, in the United Kingdom it includes (1) a person who, having, in a place outside the United Kingdom, become acquainted with an invention, not being part of the common knowledge in the United Kingdom, brings it over to the United Kingdom, and then takes out a patent; (2) an inventor forestalled by a prior inventor, who did not publish his invention so as to make it part of the common knowledge (see the judgment of Jessel, M.R., in *Plimpton v. Malcolmson*, 3 Ch. D. 351, 556).

The German statute (§ 31), with the view of discouraging delay in the fructification of useful inventions, puts the *first applicant* into the place of the true inventor, subject, however, to the right of an injured person, within a specified period (see § 23), to object to the grant on the ground that the essential part of the specification was taken from the descriptions, drawing, models, or appliances of a person other than the applicant, without the consent of such person. If the objector is successful, he may be put into the same position as if he had applied for the patent in the first instance.

In most countries patents are granted without regard to the nationality of the patentee (see, for instance, Patent, etc., Act 1883, § 4 (1); French Statute, § 27), but in Germany (§ 12) and Austria (§ 7) a patent is not granted to a foreign applicant unless he appoints an agent, residing in the country in which the application is made, with full powers to represent the applicant in all

proceedings relating to the patent. In some systems of law it is also provided that the subjects of foreign states must submit to the same disabilities in respect of the grant of patents as those imposed on foreign subjects in their own country (see, for instance, German Statute, § 12; Austrian Statute, § 31).

*Investigation by Patent Authorities prior to Grant of Patent.*—This is one of the points in respect of which considerable diversity prevails. In France a patent is granted without any examination as to the patentable character of the invention in respect of which it is claimed, or of the correctness of the specification (*"Les brevets dont la demande aura été régulièrement formée seront délivrés sans examen préalable aux risques et périls des demandeurs et sans garantie, soit de la réalité de la nouveauté ou du mérite de l'invention, soit de la fidélité ou de l'exactitude de la description,"* § 11).

In certain other countries, among which the United States, Germany, Austria, and Hungary (statute of 1895) are the most prominent, a most elaborate investigation takes place not only in respect of the correctness of the description and all formal requirements, but also as regards the merit and originality of the invention, and generally as to its patentable character (United States Revised Statutes, § 4893; German Statute, § 21; Austrian Statute, § 55).

A second method of testing the validity of a patent adopted by the German and Austrian laws, is the publication of the details of the application for the purpose of enabling objectors to oppose the grant, which they may do within two months from the date of the publication (German Statute, §§ 23 and 24; Austrian Statute, § 58).

British Patent Law takes a middle course between the absolute non-interference of the French system and the full inquiry of the American and German system. The official examination is confined to questions as to the correctness of the description and the completeness of the specification (Patent, etc., Act 1883, §§ 7 and 9), but as in Austrian and German law the details of the invention are published (*ib.* § 10), and objectors have a right to be heard within two months from the date of the advertisement. Such objections are, however, restricted in their scope, and may not extend to every ground affecting the validity of the patent (*ib.* § 11).

It is possible everywhere to have a patent revoked or declared void on the ground that the invention was not patentable, but in Germany this right is barred after the lapse of five years from the date on which the grant of a patent was publicly announced (Patent, etc., Act 1883, § 26; United States Revised Statutes, § 4918; German Statute, §§ 28 and 29; Austrian Statute, §§ 28 and 29; French Statute, § 30); it should, however, be borne in mind that, in countries in which a strict examination takes place before a patent is granted, the risk of invalidity is, of course, much smaller. The vendor of a patent does not as a general rule guarantee its validity unless he expressly covenants to do so.

*Duration of Patents.*—The maximum duration of patents is fifteen years in France, Germany, and

Austria, seventeen years in the United States, and fourteen years (but subject to extension as mentioned below) in the United Kingdom (French Statute, § 4; German Statute, § 7; Austrian Statute, § 14; United States Revised Statutes, § 4884; Patent, etc., Act 1883, § 17), but in France and in the United States the duration of patents for inventions previously patented in any other country cannot exceed the term of the patent granted in such other country (French Statute, § 29; United States Revised Statutes, § 4887).

In Spain, original and new inventions not previously patented in any other country are entitled to patents for the term of twenty years; if an invention has been patented in other countries at a date not more than two years prior to the date of the Spanish application, the maximum duration of the patent is ten years; and if an invention is not new or not original, the term of the patent may not exceed five years (Spanish Statute of 1875, § 121).

The United Kingdom is the only country in which an extension of the term of a patent may be obtained on petition. The petition must be addressed to the judicial committee of the privy council, who, if they are of opinion that the patentee, having regard to the merits of the invention in relation to the public, has been inadequately remunerated by his patent, may recommend an extension of the term for a further period not exceeding seven, or in exceptional cases fourteen, years (Patent, etc., Act, § 25, and see *"In re Samey and Solvay's Patent [1895]; Appeal Cases 78*). A similar rule formerly existed in the United States, but is now no longer in force (United States Revised Statutes, § 4924).

*Regulations as to Fees.*—The continuation of the validity of a patent is generally made dependent on the payment of certain fees. In most countries these fees are payable by instalments or annually. In some countries the early instalments are lower than the subsequent ones, for the purpose of enabling the patentee, in the case of a non-successful invention, to abandon the patent without having paid a large sum in fees, and on the other hand enabling the crown to profit by the success of a successful invention (Patent, etc., Act 1883, second schedule). The principle of progressive fees is carried out most consistently by the German Statute (§ 8). Power is given in most countries to remit the fees in appropriate cases (Patent, etc., Act 1883, § 24 (2) German Statute, § 8).

*Provisions for ensuring Working of Invention.*—The granting of a patent may be a hindrance to industrial life, if the patentee, through want of energy or want of means, neglects to work his invention, whilst others, who would be willing and able to do so, are afraid of infringing his rights. A patentee may also take out a patent for the sole object of restraining competition with articles not manufactured in the country in which the patent is taken out, and thereby injure the trade of that country. Modern patent law tries to prevent such abuses in various ways. Thus in the United Kingdom the board of trade may compel the patentee to grant licenses on reasonable terms to any person showing that the patent is not worked in the United Kingdom, or cannot be used to the

best advantage, or that the requirements of the public cannot be supplied (Patent, etc., Act 1883, § 22); and in Germany and Austria the patent may, under similar circumstances, be cancelled altogether (German Statute, § 11; Austrian Statute, § 27). In Austria a compulsory license may also—subject to certain specified conditions—be obtained by an inventor who has so materially improved a previously patented invention, that, in consequence of such improvements, its industrial importance is materially increased. In such a case, however, the original patentee may in his turn obtain a compulsory license in respect of the improvement (Austrian Statute, § 21).

*Provisions for ensuring benefit of Inventions useful for public purposes to government authorities.*—The British statute (§ 27 [2]) provides that the authorities administering any public department may, on terms agreed upon between the parties, or in case of necessity to be fixed by the treasury, use any patented invention for the services of the crown, and similar rules exist in Germany and Austria (German Statute, § 1; Austrian Statute, § 21).

The German statute also provides (§ 23) that in the case of applications for patents on the part of the imperial authorities in connection with the purposes of the army or navy, a patent may be granted without the public announcement required in ordinary cases. In such a case the patent is not entered in the register (German Statute, § 23).

*Patent Journals and Patent Libraries.*—All patent offices publish periodical information on inventions, which, besides serving their immediate purpose, are also generally useful. The collections and libraries which in many places (e.g. in London) exist in connection with the patent office are open to the public.

*International Arrangements.*—An international congress for the purpose of securing the general protection of “industrial property” including patents was held at Vienna in 1873 and at Paris in 1878, and resulted in the formation in 1883 of a “Convention pour la protection de la propriété industrielle,” to which the United Kingdom acceded on the 17th of March 1887 (by virtue of the powers conferred by Patent, etc., Act 1883, § 103). The United States and a number of other states, including France and Belgium, are members of the convention; but Germany and Austria have not joined, these countries having entered into a separate arrangement in 1891, and another arrangement having been made between Germany and Italy in 1892. The principal provisions of the convention of 1883 are: (1) that an applicant for a patent in any contracting state shall, if applying within six (or in certain specified cases within seven) months in any other contracting state, be treated as if his application in such other state has been contemporaneous with his application in the first-named contracting state; (2) that temporary protection shall be given to articles patented in any contracting state and exhibited at any officially recognised public exhibition in any other contracting state; (3) that an international office shall be established at Berne, and that a journal called *Propriété industrielle* shall

be published at such office. The publication of the last-mentioned journal seems to be the most important result of the convention.

The British government has authority to enter into mutual arrangements relating to patents with any British colony (Patentee Act 1883, § 104).

The most complete collection of patent laws is the one published by Gareis, and continued by Werner, of which 7 vols. have hitherto appeared. Carpmal, *The Patent Laws of the World*, 2nd ed., 1889, is somewhat out of date now. Edmunds and Renton, *The Law and Practice of Letters Patent for Inventions*, 1890, gives a summary of foreign patent laws, but is also somewhat out of date in that respect. The latest statutes, besides the above-mentioned Austrian statute of 1897, are a Russian statute (published in St. Petersburg in German), a Danish statute of 1894 (published in German in Berlin), and a Hungarian statute of 1895. E. S.

**PATENTE (Fr.)** A trade tax or license imposed on all persons in France exercising a trade, profession, or industry, unless specially exempted. The *patente* is distinct from the *license*, which is limited to a small number of trades, generally those under the supervision of the department of indirect taxes, corresponding to the English excise. Trades subject to the *license* usually pay the *patente* also. The *patente* was first established in 1791, when the trade corporations were abolished, and was a substitute for the dues paid by those bodies. It was at first a simple tax on the rental of the place of business and residence, and applied only to certain trades, but in 1798 it was extended and converted into a double tax—one fixed, the other proportional. A law of 1844 which forms the basis of the present legislation included all trades, professions, and industries with the exception of public functionaries, professors, writers, artists, the wage-earning classes, and certain petty occupations carried on without hired assistance. The fixed duty (*droit fixe*) is assessed on the nature of the trade or industry, and the population of the locality, increasing with the number of the inhabitants. The proportional duty (*droit proportionnel*) is based on the rental, and in addition, in some cases, on the number of hands employed. Certain trades, the importance of which cannot be estimated by the population or the rental, are taxed on their means of production, such as the number of spindles, looms, ovens, machines, etc., or, as for shipowners, the tonnage of their vessels. The taxes are combined so as to equalise the incidence as far as possible between the different trades, as some of the most lucrative are carried on in small offices or workshops, while others, in which the profits are small, require extensive premises. For the application of the fixed duty all trades and professions are divided into eight classes. In the highest, the rate in Paris and towns with a population of over 100,000, is 400 francs (£16), descending gradually to 35

francs (£1:8:4) in localities with less than 2000 inhabitants. In the lowest class the limits are 12 francs (9s. 10d.) and 2 francs (1s. 8d.). The liberal professions subject to the tax, such as those of architect, solicitor, barrister, doctor, etc., pay only a proportional tax of one-fiftieth of the rental. Persons carrying on several branches of trade in the same building formerly paid only on that on which the tax was the highest; but a law passed in April 1893 with the view of protecting small shopkeepers from the competition of the great stores, created special taxes for those employing more than 200 hands including clerks, assistants, buyers, porters, etc., which are made to pay on each branch or speciality not exceeding sixteen in number; the tax on the number of hands employed was also made progressive, commencing at 25 francs per head for the first hundred, and increasing 10 francs (8s. 11d.) per head for each hundred beyond that number, so that with 2000 hands the last hundred pay 215 francs (£8:8:4) per head, and with 3000 315 francs (£12:8:4). This aggravation of the tax was intended to reach two or three well-known business centres in Paris.

Persons having several separate establishments of the same or different kinds pay the *patente* for each. The proportional tax on the rental is generally from 5 to 10 per cent, but in some cases it rises to 15 per cent, or descends to 2 per cent. If the proprietor does not reside on the premises his separate habitation is taxed also. The classification of trades and professions is revised every five years, to include the new ones which may have sprung up in the interval. The list is, however, very comprehensive, and contains about 1500 different occupations. The new are assimilated provisionally to the one they approach the nearest. The *patente* produces about £5,000,000 annually.

[Edouard Vignes, *Traité des Impôts en France*.—Maurice Block, *Dictionnaire de l'Administration*.—Duvergier, *Collection des Lois*.] T. L.

PATERSON, THOMAS (1828-82), wood carver, lecturer, and organiser of workmen's clubs, wrote—

*A New Method of Mental Science with applications to Political Economy*, published posthumously in 1886. His theory was that "in economical problems the physical and mental elements have to be differentiated . . . if we apply to the physical and limited element reasonings only applicable to the mental elements or *vice versa* . . . we shall fail." Thus "labour" includes "force" and "plan": no limits can be set to the possible progress of plan. Possession is physical or mental: if the latter, it need not involve interference with other people's user, or the juristic idea of property. The modern employer was a labour-seller not a leader, and Paterson's ideal was "a co-operative society in which the fittest should lead, working as much for honour as for pay." J. D. R.

PATERSON, WILLIAM (1658-1719), merchant, was the founder of the BANK OF ENGLAND (*q.v.*) and author of the unfortunate Darien scheme (see DARIEN COMPANY). He was a vigorous opponent of inconvertible paper money, and appears to have suggested the SINKING FUND (*q.v.*) of 1717. His scheme for the redemption of the debt was pronounced by the *Economist* (October 23, 1858) "faultless." He was one of the earliest advocates of free trade, as opposed to the mercantile system. "There is not any one part of trade but might and would prosper better without than in a monopoly." "Trade is and will be capable of increasing trade, money of begetting money, and one improvement of making way for another, till the end of the world." His proposal for a council of trade is in several respects noteworthy. Among the powers to be given to this body were "to hear and determine all causes . . . relating to trade . . . by the law merchant and that of the sea": to purchase and build workhouses and granaries: to have power to add unto, or allow 10 per cent to, the joint stocks of all companies . . . for manufactures . . . and generally to give such other encouragements . . . as they shall think requisite for . . . promoting and enlarging trade and industry." Paterson further proposed that the punishment of death in cases of theft shall be changed to "the payment of fourfold," and that all "bribery, cheating . . . wilful bankruptcy or fraud" should be punished as theft. He strenuously opposed any tampering with the coinage. "Thus it happened: we tacitly determined, by our general practice, that a clipped coin was of equal value to an unclipped one . . . and so, being content to take halves for wholes, were put upon accordingly. If the disease be the inequality of our coin, the remedy must consist in its equality." He held enlightened views on the self-government of colonies, and proposed to found a public library for books on trade. He was ruined by the failure of the Darien company, but received, in 1715, a parliamentary grant of over £18,000. Paterson's memory and works were rescued from prejudice and obscurity by the indefatigable labours of Mr. S. Bannister.

*The Writings of William Paterson with Biographical Notices*, by S. Bannister, 3 vols., 2nd ed. London, 1859, 8vo, contain his authentic works. These include, *Central America in 1701* (publ. by Bannister 1857).—*Proposals of a Council of Trade*, 1701, 12mo.—*A proposal to plant a Colony in Darien*, 1701.—*Dialogues upon the Union at the Wednesday Club in Friday Street*, 1706 and 1717. The latter are also *Upon the redemption of the National Debt and Taxes*.—Bannister ascribes to Paterson *Letters to J. Locke on Remedy for Diseases incident to Coin*, 1696, but throws doubt on the *Conferences on the Public Debt by the Wednesday Club in Friday Street*, 1695, mentioned by McCulloch in *Literature of Political Economy*. The account of the proceedings in

connection with the establishment of the Bank of England is in the 1717 pamphlet, pp. 63-73 of vol. ii. of *The Writings, etc.* See also *The English Historical Review*, vol. xi. p. 260, art. by W. A. Steel.

H. E. E.

PATRIZI, FRANCESCO (1412-1494) born at Siena, became bishop of Gaeta, where he applied himself to study.

He was a contemporary of CARAFA, and may be included among the humanists (see HUMANISM); but he made no original contribution to political science. He repeated the theory of ARISTOTLE without enriching it. He recommends protection for merchants and tradesmen, the latter of whom, also according to him, contribute to the enriching of a country; no protection at all however, he argues, should be granted to the importers of articles of luxury. He considered that the state should provide the means of subsistence for the population, and proposed the institution of prefects to preserve the corn in the public granaries (see GRENIERS D'ABONDANCE). Living in the kingdom of Naples, he naturally occupied himself with the much-debated question of the Royal DOMAINE (*q.v.*), maintaining the advisability of its maintenance; considering, however, that, for the advantage of agriculture, such *bona fiscalia* should be administered through the system of perpetual tenants.

*De regno et regis institutione*, Parisiis, 1519, 1534, 1567, etc.—*De institutione reipublicae*, Parisiis, 1518, etc.

A. B.

PATRONAGE is the name for the right to appoint the holder of a public office. Such a right may be vested in the crown, in which case it is exercised on the recommendation of the minister to whose department the vacant office is subordinated, or in the holder or holders of some other office or offices, or it may be attached to the ownership of land. The right to appoint to offices held by laymen, which at one time was looked upon as a source of pecuniary emolument, is now—as a rule—exercised in accordance with definite general rules, and subject to the vigilant control of public opinion, and the word “patronage” is now generally used with respect to clerical offices only, and more particularly in relation to the appointment of parochial incumbents. While many livings are under the patronage of the crown, or of public or quasi-public bodies, who are supposed to exercise their right with reference to the merits of the candidates, there are many others as to which the right to appoint the parochial incumbent is vested in a private patron, being either the lord of the manor, or in the case of the right of patronage having been severed from the manor—in which case it is called an “advowson”—the owner of the advowson, who may reserve the appointment for relatives or friends, or sell the next presentation during the life of the actual incumbent, and, on the living becoming vacant, appoint the purchaser's nominee, unless the vacancy arises through the selection of the last

incumbent for a bishopric, in which case the patronage is, *pro hac vice*, vested in the crown.

The sale of the presentation during a vacancy is legally “simony,” and therefore unlawful; and it is also “simony” for the proposed incumbent himself to purchase the next presentation; but the sale of the next presentation to a third party, who may be a near relative of the proposed incumbent, is not condemned either by law or public opinion. Ecclesiastical patronage may therefore be a source of pecuniary profit.

E. S.

PATRONAGE (in the French sense). Besides its general sense, this word in French is specially applied to institutions organised and in many cases directed by the heads of manufactures and mills, or by beneficent associations, to promote the moral and material welfare either of their own workmen, or of the working classes in general, discharged prisoners, destitute young girls, etc. These institutions take various forms, such as *patronages* affording facilities for the investment of small savings, or providing at cost price sanitary dwellings or food and articles of large consumption (called, in this case *économats*); the purpose of others is, the opening of places for healthy and moral recreation, etc. LEPLAY (*q.v.*) and his school have been the most energetic and convinced promoters of these institutions: as a matter of fact, most of them have worked satisfactorily both for men and masters. The latter now tend to recede as much as possible into the background, and to give up the management to the men themselves. Yet the masters are charged, in socialistic circles, with steadily aiming at the exercise of tutelary or rather of oppressive power.

[*The Rapport de la Section d'Économie Sociale* of the Paris exhibition of 1889 (2nd vol. 1890) gives information on the then existing *patronages*. See also the article *Patronages* in the *Nouveau Dictionnaire d'Économie Politique*, the collection of the *Réforme Sociale*, Leplay's *Réforme Sociale en France* (vol. ii. pp. 406-425, ed. 1867), and Fougère, *Patrons et ouvriers à Paris* (1880).]

E. ca.

PATRONUS. (1) The head of a patrician family, to whom persons attached themselves as dependent members of the family (*clientes*, see CLIENT), was their *Patronus*. (2) A master who gave his slave liberty by a legal act of manumission became thereby *patronus* of such freedman (*libertus*), a family relation of duty and protection being thus constituted between them. (3) Patronus may also signify a defender of the cause of another in a court of justice.

E. A. W.

PAULETTE. The practice of raising a revenue by the sale of offices was introduced into France in the 15th century and became a regular system in the 16th century. Few financial expedients have proved more ruinous.

In the first place the income derived was casual and not regular, and the occasional windfalls were practically loans on which the payments to office-holders constituted an excessive interest. Thus the sale of offices gave rise to a disguised national debt contracted on very disadvantageous terms to the state. And the financial loss was by no means the only evil. In order to make the offices valuable it was necessary to give the holders a secure tenure, and so the crown had to abandon the power of dismissal. Thus the office-holders became independent, and the judges in the parliament of Paris and other sovereign courts, who had in early times been the strongest supporters of the royal power, became in the 17th and 18th centuries the most resolute opponents of the monarchy. An inevitable result of the practice of purchase was that the buyers began to look upon their places as private property. This was partially recognised by an ordinance of 1567, which allowed an official to transfer his office to another, provided that (1) the original holder survived for forty days after the bargain, and (2) the recipient paid a third of the purchase money to the state. In 1605 Sully, the great minister of Henry IV., took the final step in this direction. The members of the sovereign courts were allowed to hold their seats as private and heritable property on condition of paying annually to the state a sixtieth part of their value. This charge was called the *droit annuel*, but is more usually known as the *paulette*, because the collection of the charge was in the first instance farmed out to a man called Paulet. This innovation of Sully's was a financial reform, because it substituted a regular yearly income for the casual in-comings which resulted from the practice of sale. But, from the point of view of the monarchy, the political results were by no means equally satisfactory. By the institution of the *paulette* the magistracy was made into a close hereditary class, and thus its independence was greater than ever. This result was to some extent foreseen, hence the system was not at first made permanent, but was fixed only for a period of years. Thus the crown reserved some control over officials, and could threaten, in case of opposition, to put an end to the *droit annuel*, which would at once deprive them of the property in their seats. But the official classes clung tenaciously to a system which gave them such obvious independence. When, in 1648, the government tried to coerce the judges, by allowing the *paulette* to expire without renewal, the vigorous opposition of the parliament of Paris was one of the chief causes of the Fronde. And their opposition was so far successful that, with some few interruptions, the *paulette*, and the hereditary tenure of offices of which it was the symbol, lasted till the old régime was overthrown by the Revolution (FARMER-GENERAL; FARMING OF TAXES).

[Clamagèran, *Histoire de l'Impôt en France*, t. ii. p. 378, et seq.] R. L.

PAULUS JULIUS, a Roman prætor of the 3rd century. In the *Corpus Juris*, under the title of the Purchase-Sale (Dig. XVIII. i. 1) is inserted a law of Paulus, which explains the origin of exchange and specifies the function of money.

The Prætor says: "Origo emendi vendendique a permutationibus cœpit: olim enim non ita erat numus: neque aliud *merx*, aliud *pretium* vocabatur: sed unusquisque secundum necessitatem temporum, ac rerum, utilibus inutilia permutebat, quando plerumque evenit, ut, quod alteri superest, alteri desit; sed quia non semper, nec facile concurrebat, ut cum tu haberes quod ego desiderarem, invicem haberem, quod tu accipere velles, electa materia est, cujus publica ac perpetua æstimatio difficultatibus permutationum, æqualitate quantitatis subveniret; æque materia forma publica percussa, usum dominiumque non tam ex substantia præbet, quam ex quantitate: nec ultra *merx* utrumque, sed alterum *pretium* vocatur."

The Italian economists of the last century discussed with much learning and heat the Roman ideas on money, its origin, and the functions of exchange—while PAGNINI maintained that the ideas of the Romans on money were altogether opposed to those of the economists of his century, Gian Rinaldo Carli and more fully Pompeo NERI showed that they were conformable to them. See also the monograph of Giulio Alessio on the conception of value in classical antiquity (*Archivio Giuridico italiano*, vol. xlii. Bologna, 1889); H. Cernuschi discussed it, showing that the conception of money as he explained it was entirely conformable to that of the Prætor Paulus Julius (*Anatomie de la Monnaie*, Paris, 1886, pp. 9-10).

See in the "*Corpus Juris Civilis romani*": Edit. cum notis integris Dionysii Gothofredi, Neapoli, 1828, Lib. xviii. Tit. I.—*De contrahenda emptione et de pactis inter emptorem et venditorem compositis et quæ res venire non possunt. De origine emptionis, et venditionis, ejusque et permutationis differentia.*—*De nummis I. Quibus modis emptio contrahitur.*—I. Paulus, lib. 33, ad Edictum.

A. B.

PAUPERIES is an expression used in Roman law for accidental injury caused to a person by an animal belonging to another, contrary to the nature of the animal. The party thus injured could claim from the owner of the animal damages for the injury, unless the owner preferred to surrender to him the animal which had done the mischief. This practice of surrender, which was applicable also in the case of injuries committed by children under paternal power and by slaves, had its origin in the primitive notion of vengeance against a person or thing that has been the cause of damage. But in course of time the master or owner of the guilty object was allowed to buy off such vengeance by payment of pecuniary damages (see Holmes, *Common Law*, Lecture I.).

E. A. W.

PAUPERISM. The word "pauperism" is used in two senses. It is a state, that is a condition, and it is also the sum of paupers. In the first sense it is uniform, it follows a definition and consequently is always the same thing; in the second, it fluctuates from year to year, and from district to district. 1. In the first sense it is a legal term. The pauper in the eye of the law, and in the technical sense, is a destitute person, in receipt of relief administered under the poor law. He is a destitute person, and destitution implies an absence or want of the necessities of life, food, clothing, shelter. Thus pauperism is clearly distinct from poverty. The poor man is one who, having the necessities of life, falls short of some standard of comfort, whether that standard be determined by reference to some end, *e.g.* a sufficiency to lead a high type of life, or to the circumstances and average of the time. The rich man of one generation in one century may be the poor man of the next, but the necessities of life are always the same, when interpreted in the sense of "enough to keep body and soul together." Now to these necessities every member of the United Kingdom has a right at the hand of the state, a right which is secured to him by a series of acts, beginning with the celebrated 43 Eliz. c. 2. To meet this claim an elaborate machinery or organisation exists, composed of a central authority, now the local government board, and 637 local authorities, viz. boards of guardians with their several administrative officers. On these local authorities lies the obligation to provide for the destitute the means of subsistence, but the conditions under which they do so vary greatly, and will be discussed elsewhere (POOR LAW, ADMINISTRATION OF). The moment that a destitute person has been relieved he is a pauper, and as such suffers certain disabilities, *e.g.* the loss of the right to vote at elections, but no such disability attaches to the receipt of medical relief only. It is true that even government has not always been consistent in its use and interpretation of the terms destitution and pauperism. Thus in a circular of the local government board of the 25th of January 1875, we find it stated that the spirit of administration in workhouses has changed of late years in consequence of a change (i) in the circumstances of the time; (ii) in the character of the recipients of relief. This implies that workhouses are now expected to "move with the times," and to interpret the phrase "necessaries of life" in the light of the average standard of living at the present time. In other words, that destitution has ceased to be the test for the receipt of relief, and guardians no longer confine themselves to "measuring destitution" in the relief which they give. 2. In its other use, pauperism denotes the number of paupers in a country at a

given time, a statement which clearly is subject to great variations. With the causes of these variations we need not here deal particularly, but merely remark that they include the state of trade and production generally, and the administration of the law itself among other factors. Pauperism and the amount of it may be reckoned on several bases, *e.g.* the number of persons receiving relief during a given period, or the number of cases, or the number for a given day. For the purposes of comparison it is clearly indifferent which is adopted, provided that the same basis be taken at the two periods, but for the purpose of particular inquiries the distinction is most important. Again the cost of pauperism must often be taken as an index to its amount, in the absence of more accurate statistics. Roughly, the pauperism of England has shown a tendency to increase and decline over certain long periods. From 1601 to a point which may be put at 1750, pauperism on the whole diminished. Thus the cost of maintaining the poor fell from £819,000 in 1698 to £619,000 in 1750, in spite of an increase in population. From 1750 to 1817 the growth of pauperism was rapid and great, the cost rising from £1,912,000 in 1785 to £4,077,891 in 1808, and to £7,810,801 in 1817. From this year onwards a decline takes place, slow at first but more rapid after the passing of the new poor law in 1834. Thus in 1849 the paupers in England and Wales were 6·3 per cent of the population; in 1860, 4·3. The American War raised the percentage to 5·3 in 1863, but by 1873 it had fallen again to 3·8, in 1883 to 3·0, in 1893 it stood at 2·5 and in 1896 at 2·6.

L. R. F.

PAWN, a pawn or PLEDGE (*q.v.*) is where possession of a personal chattel is delivered by one person to another as security for a debt. The general property remains in the pawnor; the pawnee takes the possession and the right to possess. The pawnee may sell the goods on non-payment of the debt after the time fixed for repayment has expired; if no such time has been fixed the pawnor must demand payment before selling. Where a sale takes place the pawnor is entitled to the net surplus after payment of the debt and all expenses. If the pawnor pays the debt he at once acquires the right to possess.

A distinction is drawn between a pawn and a MORTGAGE, of chattels. In the case of a pawn the pawnee acquires only a special or limited property in the goods; in a mortgage the whole property passes subject to a condition that on repayment of the debt the property will be reconveyed. A right of sale is incident to a mortgage of chattels.

A pawnee does not as a rule acquire any greater right to the chattel than that which the pawnor had; but to this principle there are some exceptions contained in the Factors Act

1889. Pawnbrokers are subject to special rules (see PAWNBROKING).

[Goodeve, *Personal Property*, London, 1892.—Turner, *Contract of Pawn*, London, 1883].

J. E. C. M.

**PAWNBROKING.** This expression denotes the professional lending of small sums on the security of a PLEDGE (*q.v.*). This kind of business, from its nature, is liable to great abuses, inasmuch as it may, if uncontrolled, be made a pretext for the habitual receiving of stolen goods; whilst honest borrowers may be subjected to cruel extortion. For this reason pawnbroking in most countries is either under public supervision or else entirely in the hands of public institutions (see MONTS DE PIÉRE).

In Great Britain the enactments relating to this matter were consolidated by the Pawnbrokers Act 1872 (35 & 36 Vict. c. 93), which requires any person who carries on "the business of taking goods and chattels in pawn," or who carries on any business which, though apparently intended for other transactions, is in effect a business for lending money on the security of goods and chattels—in so far as the loans are for less than £10—(1) to take out yearly licenses, which are not granted if the applicant fails to produce satisfactory evidence to character, or if his shop is frequented by thieves or persons of bad character; (2) to use certain prescribed books of account; (3) to exhibit his full name over the outer door of his shop, with the word "Pawnbroker"; (4) to exhibit, in a conspicuous place of his shop, certain regulations as to the conditions and terms on which loans are granted.

The act regulates these terms and conditions; but in the case of loans between £2 and £10, the statutory regulations do not apply if a special contract, the form of which is prescribed by the act, is made between the parties. As regards loans to which the regulations apply, a maximum profit is fixed as well as a minimum term for redemption; and the sale of unredeemed pledges is subjected to certain specified rules. In all cases a pawn-ticket must be handed to the borrower, and must contain particulars as to charges, time and condition of redemption, and other prescribed matters. A pawnbroker is not entitled to take articles in pawn from any person appearing to be under the age of twelve years, or to be intoxicated; he must not employ any person under the age of sixteen years as an assistant; and must not do business on any public holiday. There are, also, special provisions intended to make it more difficult for pawnors to pledge goods entrusted to them or stolen by them, and to prevent pawnbrokers from taking such goods in pawn; and a pawnbroker who reasonably suspects any person of not being entitled to pawn an article offered as a pledge, may deliver such person and such article into the custody of a constable. A stipendiary magistrate, or any justices sitting as a court of summary jurisdiction, may order a pawnbroker at any time to produce his books and the papers relating to his business. Disobedience to any rule laid down in the Pawnbrokers Act subjects the person concerned to penalties, varying

according to the nature of the offence. If a pawnbroker is convicted of fraud in his business, or of knowingly receiving stolen goods, the court before whom he is convicted may declare his license to be forfeited.

E. S.

**PAYEE.** The person to whom or to whose order the amount specified in a bill of exchange is payable. If a bill to order is not drawn to the drawer's own order some person must be named as payee.

[Chalmers on *Bills*, London, 1891].

J. E. C. M.

**PAYMENT.** The term payment primarily means a payment in money. A creditor is always entitled to have his debt paid in legal tender, and is not obliged to take a bill or cheque, or to allow a settlement in account. But "payment" is not a technical term, and it is held to include any settlement of a debt which is treated by the parties on a cash payment, though no money actually passes.

When a bill or note is taken in payment of a debt, the strong presumption is that it is taken as conditional payment only. In that case, if the bill or note is dishonoured, the creditor is remitted to his original rights, and can sue for the debt as well as on the instrument.

M. D. C.

**PAYMENT FOR HONOUR.** See HONOUR, PAYMENT FOR.

**PEACE OF GOD.** See TRUCE OF GOD.

**PEACOCK, GEORGE** (1791-1858), dean of Ely, was the author of an *Algebra*, the parts of which relating to the use of symbols may be consulted with advantage by the mathematical economist. Peacock's doctrine of the negative sign to represent debt has indeed been impugned by Mr. Macleod (*Theory . . . of Banking*, ch. iv. § 2, art. 18); but then Mr. Macleod's own doctrine has been impugned by COURNOT (*Revue Sommaire*). Those who agree with Cournot may employ in Peacock's defence one of the principles which he has enunciated: namely that the subtraction of a negative is positive. The refutation of an adverse criticism amounts to a rehabilitation.

JEVONS also (*Theory*, ch. viii.) has taken exception to the certainly inelegant representation of interest in Peacock's earlier treatise on algebra. The passage was withdrawn by the author from his second edition or version.

A more concrete contribution to political economy was made by Peacock in his review of the agriculture and land tenure of Madeira which contains much interesting information and reflection; for instance with respect to the metayer system (see MÉTAYAGE).

There is also attributed to Peacock by the writer of his life in the *National Biography*, a pamphlet on the corn-laws (1846), in which it is argued that a free trade would not therefore be a regular trade, it being assumed that our domestic produce is sufficient for our

domestic consumption in two years out of three.

*A Treatise on Algebra*, 1830.—*A Treatise on Algebra*, 1842-45.—*Treatise on Climate and Meteorology of Madeira*, by J. A. Mason. (Part iv., a review of the agriculture and tenure of land, by Geo. Peacock), 1850.—*Upon the probable influence of a repeal of the Corn Laws upon the trade in Corn*, 1846. (Anonymous; contained in the library of the British Museum under the shelf marked 8245, d. 55).—*Answers to the Questions communicated by Lord Overstone to the Decimal Coinage Commissioners* (Decimal Association), 1857.

F. Y. E.

PEARSON, CHARLES HENRY (1830-1894), historian, politician, advocate of land-taxes, and minister for education (1886-1890) in Victoria; wrote *National Life and Character, A Forecast* (1893), in which he prophesied that white men would leave the tropics and be squeezed into the temperate zone, and the squeezing process would fuse different classes in a state socialism which would sap church, family, and individual character, the latter being also menaced by big public debts, armies, and towns. The individual would wither and the race grow more and more, and the old age of the Aryan races, which had already set in, would be passed under "a gray sky." B. Kidd's *Social Evolution* (1894) criticised (p. 323) but resembled this book; both books lay stress on the moral and intellectual sense. Pearson thought that the mind could only postpone and mitigate, Kidd that it could make and avert destiny. Sociologists have written far less important books with far greater scientific pretension on the same subjects.

[C. H. Pearson, *Reviews and Critical Essays*, edited with Memoir by H. A. Strong (1896).—*The National Dictionary of Biography* (1895) s.v. "C. H. Pearson" enumerates and appraises his other works.]

J. D. R.

PEASANT PROPRIETORS. It has been shown in the article on MORCELLEMENT, containing statistics of present landownership, that in France, the country in which, with Belgium, peasant proprietorship exists on the most extensive scale, this institution had existed long previous to the French revolution, though that movement gave it a considerable impetus. It may incidentally be observed that during the most prosperous period of the middle ages, say before the beginning of the Hundred Years' War, tenants in villeinage, so long as they paid their dues to the lord of the manor, whether in money or in kind, enjoyed legally the same security against ejectment as the 19th-century peasant owner who discharges his taxes punctually.

Three principal arguments have been directed against peasant proprietorship: 1st, it does not yield the same returns as farming on an extensive scale; 2nd, it generates low, parsimonious, and avaricious habits of mind; and

3rd, it depresses the birth-rate and interferes with the normal development of population. To each of these complaints a reply has been made: 1st, the return of corn grown by small peasants may be, and probably is, really inferior, but this inferiority does not appear in vegetable and orchard cultivation, which are important in our present agricultural system, nor in the cultivation of vines and such crops as tobacco. If sheep-breeding unmistakably requires extended areas, experience shows that breeding ordinary horses and cattle, as well as poultry, can be managed successfully on small holdings. 2nd, the debased state of mind discovered among the French peasantry by some writers, like Lady Verney in *How the Peasant Owner Lives*, has been grossly exaggerated, and their so-called low style of living is still far superior to that of day-labourers in many countries with large hereditary estates. 3rd, granting that peasant proprietorship acts to a certain extent as a check on population, prudential considerations are quite as prevalent among well-to-do farmers and the inhabitants of towns, and the birth-rate remains high in countries (like Belgium) with a considerable proportion of peasant ownership in land; on the other hand, over-population or *Uebersättigung*, involving the existence of a miserable urban or rural proletariat, is an unmitigated evil.

Another objection, formerly more solid, is that small peasant proprietors, as a body, are addicted to routine and averse to scientific improvements; and that, even if they were willing to adopt the latter, their means are often insufficient to cover the necessary expenses. However, the diffusion of instruction has decidedly removed this hostility to progress, and association now enables French peasants to use, for instance, steam threshing-machines, and to found, in the east of France, under the name of *fruitières*, co-operative manufactories of cheese, working on the most approved principles; in other places the same organisation is adopted for making butter. If in southern France, after the invasion of the phylloxera, large wine-growers were the first to adopt scientific antidotes to this disease, their example has later on been followed by their smaller neighbours. Small peasant proprietorship is the most powerful incentive to labour; it affords the best opportunity of employing the whole family under the direction of its head, and strengthens family-life. In small and middle-sized farms owned by men working themselves, the "eye of the master" can better observe what is wanting than in very large farms; further, the owner is not tempted, as the farmer may be, to sacrifice the permanent qualities of the soil to gaining immediate but temporary profits; he husbands the fertility of his land, and shudders at the prospect of exhausting it. On

small occupancies, where he only grows corn for the use of the family, he is more independent of market fluctuations. Again, a large body of peasant proprietors affords a steady bulwark against political, and still more against social, turbulence, and, in fact, the leaders of French COLLECTIVISM, finding that it is expedient not to frighten this class of voters, have several times ostentatiously protested that they intended to respect the right of private property for small fields tilled by their owners; this respect, however, does not prevent jealousy of wealthier neighbours, so that this safeguard is not to be relied on absolutely.

To conclude, if some of the preceding remarks are alike favourable to peasant proprietorship and to cultivation by small tenant-farmers, this is not the case with all of them. Small tenants, especially tenants at will or for a very short term of years, are necessarily deficient in the feeling of independence and self-reliance, as well as in the incentive of future hopes, which are the most happy characteristics of the former system. Large and middle-sized ownership in land, as well as cultivation by affluent landlords, or by farmers possessed of the necessary means, may of course also be maintained; what is contended is that each mode of cultivation has its proper sphere of action, and that none ought to be indiscriminately rejected.

In former times, except by Francis Bacon in the essay on the *True Greatness of Kingdoms*, peasant proprietorship was rather looked upon with distrust in England. Though in his *Tour through France*, Arthur YOUNG admits that the magic of property suffices to turn sands into gold and rocks into scenes of fertility, he is a strong upholder of the English system of extensive estates, either cultivated by a rich landlord or by farmers provided with a large capital: "Deduct from agriculture all the practices that have made it flourishing in this island, and you have precisely the management of small farms" (*Eastern Tour*, vol. ii. p. 161). Malthus, inclining to believe that "all the great results in political economy depend upon proportions," admitted that "the division of landed property to a certain extent is of the utmost importance," but apprehended that the "owners of the minute divisions of landed property [in France] . . . must perish in great numbers in every scarcity," if "the effects (of this division) should not be weakened by the operation of an extraordinary degree of prudence in marriage" (*Principles of Pol. Econ.*, pp. 432-434, ed. 1820). Adam Smith, on the other hand, had observed that "a small proprietor, who knows every part of his little territory . . . is generally of all improvers the most industrious, the most intelligent, and the most successful" (*Wealth of Nations*, bk. iii. ch. iv.). But, excepting writers of democratical tendencies such as GODWIN (q.v.), English economists of high standing have mostly followed in the footsteps of Arthur Young. Nevertheless, towards the middle of this century, a reaction, initiated by and based on such works as Kay's *Social Education and Condition of the*

*People*, Laing's *Journal of a Residence in Norway*, Howitt's *Rural and Domestic Life of Germany*, Thornton's *Plea for Peasant Proprietors*, etc., set in and found a powerful expression in the chapters devoted by J. Stuart MILL to peasant proprietors in the second book of his *Principles of Political Economy*. Since those days similar views are to be met in the collection of essays printed by the Cobden Club under the title of *Systems of Land Tenure in Various Countries* (1870), and have found another exponent in Professor Thorold ROGERS (see for instance *England's Industrial and Commercial Supremacy*, 1892, pp. 314 and 350).

On the whole, German economists may also be said to be favourable to small agricultural landowners; a general survey of the literature on the subject will be found in Roscher's *National-ökonomik des Ackerbaues* (p. 197, ed. 1888). He himself declares that a judicious mixture of large, middle-sized, and small estates constitutes the economically soundest system for a nation (*ib.* pp. 188-189); see also "Bauerngut" and "Bodenzersplitterung" in Conrad's *Hdwb. der Staatswissenschaften*.

In France, the physiocrats, and especially the founder of the school, QUESNAY (q.v.), have been the only systematic admirers of the English system, on the principle that the *grande culture* yields much more than the *petite culture* (see the latter's articles "Fermiers," "Grains," and "Maximes Générales du Gouvernement Économique" in Quesnay, *Œuvres*); however Quesnay steadily assumes that corn is to be the leading produce of the *royaume agricole*. TURGOT also contends that the method of cultivation by rich farmers is the most advantageous; still he adds the proviso "supposing that the country be already a rich country" (§ xvii. of the *Réflexions sur la Formation des Richesses*). Carried away by his admiration for the variety of the crops produced by the soil of France, MIRABEAU the elder, on the opposite side, advocated the extreme division of land: "How different the fertility of a small domain, which sustains a hard-working family, and that of huge estates abandoned to passing farmers or to lazy and indolent agents! . . . The subdivision of land cannot be pushed too far in a *canton*; this difference between the *trium* and the *meum* . . . is the principle of vivification of a state" (*Ami des Hommes*, p. 46, ed. Guillaumin). Without going to this extremity, it may be broadly stated that from the first quarter of the present century, the great majority of French writers on agronomy have, like ROSCHER, looked favourably on small culture and peasant proprietorship co-existing with a due proportion of large and middle-sized agricultural estates, from Sismondi, *Tableau de l'Agriculture en Toscane* and *Nouveaux Principes d'Économie Politique*; Gasparin, *Des Petites Propriétés* (1821); De Barante, *Des Communes et de l'aristocratie* (1821); Hippolyte Passy, *Des systèmes de culture en France* (1846 and 1853) (see the appendix on the repartition of territorial property), to Lavergne's *Économie rurale de la France*; Baudrillart's *Populations agricoles de la France* (1885); De Foville's *Morcellement*, and the latter's and MM. Bernard's and Zolla's articles in the *Nouveau Dictionnaire d'Économie Politique*

(1892). Both sides of the question are ably summed up by M. Paul Leroy Beaulieu in his *Traité théorique et pratique d'Economie Politique* (vol. ii. pp. 1-30).

In Italy the flow of ideas has generally been in favour of peasant proprietorship down from the days of Verri (*Meditazioni sull' Economia politica*, 1771), and of Filangieri (ch. iii. and iv. of the *Leggi politiche ed economiche*, 1780). In our own days, Professor Achille Loria considers the constitution of exclusively small proprietorship in land resulting from the gradual disappearance of rent, to be the further and natural result of contemporary social and economic evolution (*La rendita fondiaria e la sua elisione naturale*, 1880).

[For further bibliographical information on peasant proprietorship in France, see the bibliography of MORCELLEMENT.] E. Ca.

**PEASANTS' REVOLT.** This rising, one of the most striking episodes in English history, is remarkable alike for the variety of causes which produced it; the mysterious character of its organisation; the widespread area which it affected; the absence of any unity, whether of purpose or of action, displayed by its leaders; and the many cries, political, religious, social and economic, to which utterance was given.

The immediate causes, the pressure of heavy taxation culminating in the levy of two poll-taxes, and the unpopularity of the government, were indeed political; but the deeper reasons are closely connected with the economic changes produced by the BLACK DEATH (*q.v.*). The scarcity of labour consequent on that pestilence led to many attempts to enforce more strictly the old agricultural services due from tenants, and possibly even to revert to them in cases where they had been commuted for money payments; while parliament tried to meet the emergency by stringent statutes regulating labour and the rate of wages. These measures were resisted, and the discontent, fanned by the teaching of Wiclifites and of friars, led to open rebellion in June 1381 upon the imposition of a second poll-tax.

The rising affected Norfolk, Suffolk, Cambridge, Essex, Hertford, Middlesex, Hants, Sussex, Kent, Somerset, Huntingdon (*Rot. Parl.*, iii. 111 *et seq.*); Devonshire (Knighton), Lancashire, York, Lincoln, and Durham were prepared to join, although we only hear of tumults at Beverley and Scarborough (Stubbs, ii. 489). Of the details connected with an organisation which embraced so wide an area, and was capable of simultaneous action, we know little. It was probably due, partly to the associations created to set aside the statutes of labourers (see LABOUR STATUTES), partly to the Wiclifites and friars whose wandering habits rendered them useful disseminators of information, and partly also to the discharged soldiers who had some experience of risings against authority in France and Flanders (Stubbs, *Const. Hist.*, ii. 491).

In Kent, where VILLEINAGE was unknown (Stubbs, ii. 489), and in London the movement was against heavy taxation and the misgovernment commonly attributed to John of Gaunt, but in the eastern counties the chief grievance alleged was that of villeinage. The insurgents demanded the abolition of villeinage and of tolls, a general pardon, and the commutation of villein service for a rent of not more than 4d. an acre. The attack was directed against landlords, both lay and clerical, and included the destruction of manorial rooms and documents, which preserved record of the obnoxious services (see SERVICES, PREDIAL AND MILITARY). The violence of the rebels at Bury St. Edmunds and St. Albans is graphically described by Walsingham (*Hist. Anglicana*, i. ii.; *Gesta Abbatum*, iii.).

The course of the rising is a matter of political history, and in this place it may be sufficient to note that it was quelled within a fortnight, and that the king (Richard II.) speedily revoked the charters of manumission and pardon conceded under the influence of panic, a measure subsequently approved by parliament (*Rot. Parl.*, iii. 100). The result must from the standpoint of the economic historian be regarded as a failure. Though villein service gradually died out, this was due, not to the rising, but to the influence of other forces, some of which had begun to operate before this time, although the change may have been accelerated by the difficulty of enforcing unwilling service. The history of the decay of manorial organisation has not been fully worked out, but it seems clear that as more profitable and more economical methods of working the land as pasture were widely adopted in consequence of a greater demand for native wool, the necessity for exacting the old services was lessened (see MANOR). In some cases villeins abandoned their holdings (F. W. Maitland in *Eng. Hist. Rev.*, ix. 425), attracted probably by more profitable openings in the towns, and thus the difficulty of maintaining the *status quo* on the manors increased. Under these circumstances commutation became general, and the villein became the copyholder as we know him in the 15th and 16th centuries; although from Fitzherbert's description (*On Surveyinge*, c. xiii.) and from isolated cases (Cunningham, *Growth of Engl. Industry*, i. 402, 533) it would seem that bondmen (see SERVUS) were still to be found in the 16th century, and even later, whose position differed but little from that against which the villeins of 1381 had made their protest (M. Kovalesky in *Archaeological Review*, i. 444).

E. A. M.

PECCHIO, GIUSEPPE (1785-1835). Was born in Milan, a member of a noble family; he held important offices, and was exiled in 1820 for his political opinions. He lived a long time in England. His name is known to students of the history of economics for his sketch of the history of political economy in Italy; this work was much read and appreciated, as is shown by several editions, and a translation into French; the success of the work was, however, perhaps beyond its merits. The author endeavours to condense into one volume the most important subjects in the large collection of Italian writers on economic matters, published at the beginning of this century by Baron Custodi. This collection was left incomplete, and Pecchio also did not finish his work. To expound superficially in a series of biographical and bibliographical sketches the lives and principal theories of a certain number of authors does not by any means constitute a history of the science.

Pecchio was also the author of another historical work on the finance of the first Italian kingdom.

*Saggio storico sull'amministrazione finanziaria dell'ex Regno d'Italia dal 1802 al 1814*, London, 1822 (published in other editions).—*Storia dell'economia pubblica in Italia*, Lugano, 1829 (published several times, finally in Turin, 1852; translated into French, Paris, 1830). U. R.

PECQUEUR, CONSTANTIN (1801-1859), born at Arleux (Nord), died in Paris.

Originally a follower of SAINT SIMON, then of FOURIER, he did not definitely enrol himself in any school, preferring to follow his own bent, but by so doing he became entirely isolated. In his writings, while he aimed at, and even to some extent attained being practical, yet he tended more and more towards an ideal religious and mystic communism.

His first work, *Des intérêts du commerce, de l'industrie et de l'agriculture et de la civilisation en général sous l'influence des applications de la vapeur*, 2 vols. 8vo, 1st ed., 1838, 2nd ed. 1839, received a prize in 1838 from the Academy of Moral and Political Science. The originality and the not infrequent directness of insight of the work deserved this. In his second work, *Des améliorations matérielles dans leurs rapports avec la liberté*, 18mo, 1st ed. 1839; 2nd ed. 1847, Pecqueur evinces a more progressive and liberal

spirit. This work, though antiquated, deserves to be read. Besides a pamphlet *Lettres à M. Dufaure sur les chemins de fer*, he wrote a large volume 8vo, published in 1842 under the title of *Théorie nouvelle d'économie sociale et politique ou étude sur l'organisation des sociétés*, in a more serious strain, and it is to be regretted that he did not act more in concert with the economists, his contemporaries, as Michel Chevalier did some years later, instead of waging war against the mistakes and prejudices of his time. After having written two works in which political economy only takes a second place, *De la paix de son principe et de sa réalisation*, 8vo, 1842, and *Des armées dans leurs rapports avec l'industrie, la morale et la liberté*, 8vo, 1842, he published, in 1844, *De la république de Dieu*, a small volume in 18mo, in which his Christian socialistic views are prominent. In 1849 he published a paper *Le salut du peuple*, which only reached a few numbers. His views, and the scientific value of his works, place him in an intermediate position between the socialists of his time and the economists of the liberal school.

A. C. f.

PEDIDO. See MONEDA, PEDIDOS or SERVICIOS.

PEDLAR. Pedlars are persons who travel about from house to house offering goods for sale. They differ from hawkers in that the latter travel with horses. By the Pedlars Act 1871 (34 & 35 Vict. c. 96) a pedlar requires a certificate from the chief officer of police, but he is exempt from excise duty. A hawker pays £4 per annum for each horse employed.

J. E. C. M.

PEEL, SIR ROBERT (1788-1850), statesman and financier, was the eldest son of the first baronet of the same name. He took a double first at Oxford in 1808, and the next year entered the House of Commons as member for Cashel. His prudence, tact, and general business-like qualities soon made themselves felt. In 1811 he became secretary for the colonies, and he held the office of secretary for Ireland from 1812 to 1818. Here he opposed the practice of selling public offices, and of dismissing civil servants for political action, and established the body of police afterwards consolidated into the Royal Irish Constabulary.

In 1818 Peel resigned office, but as a private member carried in the following year the first of his important economic and financial measures. Being appointed chairman of the committee on currency, which also inquired into the state of the Bank of England, he moved the resolutions which led to the resumption of cash payments (see BANKING). During the restriction of cash payments (1797-1821), the notes of the Bank of England had been at one time depreciated in value no less than 20 per cent, and were valued only at 16s. in the £1 as compared with gold. Peel's bill for the resumption of cash

payments was passed in 1819. It was to have come into effect in 1821, but its provisions were previously adopted spontaneously by the Bank of England.

In 1822 Peel re-entered the ministry as home secretary, but withdrew with the Duke of Wellington in 1827, when Canning became head of the government. On the death of the latter, the Wellington-Peel administration was formed. In 1828 Peel had created the metropolitan police force, claiming that by this act for indirectly preventing the increase of crime he was paving the way for a considerable mitigation of the criminal law. In November 1830 the government went out of office, having been defeated on a motion to revise the civil list.

Towards the close of 1834, William IV. dismissed his Whig ministers, and Peel became first lord of the treasury and chancellor of the exchequer. In April 1835 he resigned, having during his short term of office established the ecclesiastical commission.

While in opposition he was so powerful that one of his opponents declared "the right honourable member for Tamworth governs England."

After the defeat of the government in 1841 Peel came in at the head of his memorable administration. Fiscal reform was one of his chief aims, and in 1842, assisted by Gladstone, he brought forward his great scheme of a revised tariff. The country warmly welcomed the relief afforded in the reduction or removal of many items of taxation. But one part of the scheme was not so popular. Peel found himself compelled to establish an INCOME TAX on all incomes of £150 a year and upwards. This tax was not new; it had been imposed by W. PITT, and Peel urged that it was once more demanded both on grounds of national honour and of administrative prudence. The relief of taxation in other ways, however, was quite unparalleled, for out of 1200 articles comprised in the new tariff, the duties were reduced on 750. Peel still maintained the sliding scale of duties on foreign corn, but modified it by changes in the method of fixing the averages of prices, and by lowering the protection afforded on the different degrees of the scale to home-grown wheat. The maximum protective duty, which had been 27s. per quarter when home-grown wheat was under 60s. per quarter, was reduced to 20s., and was only to take effect when wheat was under 50s. After protracted debates the ministerial proposals were carried, and the public funds at once rose from 89 to 93.

In the session of 1844 Peel brought forward his measure for the revision of the bank charter. It was practically a reorganisation of the Bank of England (see BANKING). An act had been passed in 1833 which maintained

the Bank of England in its privileges until 1855, with the provision that, ten years after the date of the measure, parliament might revise the charter. The ten years had now elapsed, and Peel produced a revised scheme, which was carried. The charter was renewed till 1st August 1855, or longer, if the debt due to the bank, £11,015,100, with interest, etc., were not paid after due notice; the issue department was established; weekly returns were required to be published; the issue of notes was limited to £14,000,000 on securities. Thus Peel had the satisfaction of accomplishing the monetary reform which he began in 1819. Events have not, however, entirely fulfilled his anticipations. Three times since 1844—in 1847, 1857, and 1866—a relaxation of the Bank Act has been compulsorily agreed to (see BANKING), although only on one of these occasions, in 1857, was the strict limit of the law overpassed. More than once important alterations in the measure have been proposed, though none as yet have been made.

Ireland was the next subject which occupied his thoughts. In 1843 Peel appointed the well-known Devon commission to inquire into the state of the law and practice with respect to the occupation of land in Ireland. The report presented in 1845 revealed for the first time the cause of the distressed state of Ireland.

Peel supported Sir J. GRAHAM's factory legislation (FACTORY ACTS). In February 1845 his budget continued the income-tax calculated to produce £5,200,000, while in the customs duties, abolitions and reductions were effected amounting to £3,338,000. The alteration of duties on four articles—sugar, raw cotton, coal for export, and glass—occasioned a diminution in the revenue of £2,740,000. The import duties on 430 articles were entirely abolished, resulting in a loss of £3,500,000 (see CUSTOMS DUTIES). But after all reductions, there was still a surplus of £71,000 at the end of the financial year 1845-46.

Meanwhile, the much-agitated question of the corn laws was rapidly requiring a settlement. The potato famine in Ireland during autumn 1845, followed by many deaths, rendered cheaper corn necessary. Peel, deeply impressed by the condition of Ireland, proposed in the session of 1846 the gradual repeal of the corn laws, complete free trade in corn to take final effect after three years (see FREE TRADE). The minister was again acrimoniously assailed by his friends, and on the day that the corn law bill was passed in the Lords the government were defeated in the Commons. For a time the power of the Conservatives was annihilated—perhaps the most striking example in English modern political history of the success of a great economic principle leading to

the defeat of the political party which had supported it.

Peel resigned office, but while in opposition he cordially supported the new Whig government in their measures for practically abolishing the navigation laws, for relieving the Jews from their political disabilities, and for the promotion of popular education. Peel was not a brilliant orator, but he had great weight as a wise and sagacious party leader, and his personal character stood high. His services to the state were great and enduring, and if he was at times an opportunist, it was always with an eye to the national interests, and never from any desire for personal aggrandisement.

[Only Peel's economic measures can be dealt with here; for his other public measures see *Memoirs* by Peel, edited by Lords Stanhope and Cardwell.—*Life* by Viscount Hardinge and A. W. Peel (Speaker), edited by C. S. Parker.—*Biographies* by Cooke Taylor, Sir Laurence Peel, Lord Dalling, G. Barnett Smith, F. C. Montague, Justin McCarthy, J. R. Thurstfield, etc., the *Annual Register*, 1850; articles in the *Nineteenth Century*, the *Edinburgh* and *Quarterly Reviews*.—*Dictionary of National Biography*, the *Westminster Review*, etc.] G. B. S.

**PELLS.** The office of clerk of the pells, so called from the pells or sheepskins on which the records of the office were written, was one of the most ancient in the exchequer. The clerk of the pells was originally the Treasurer's own private clerk, and it was his duty to keep separate records of all moneys entering and leaving the exchequer. These records were kept on two rolls, called respectively the *pellis introitus* or Pells receipt roll, and the *pellis exitus* or Pells issue roll. On the former was entered every sum paid into the exchequer, with the receiving teller's name, copied from the TALLY, or in later times the teller's bill, as it was thrown down into the tally court; while all payments out, with the authority for making them, were similarly entered on the issue roll. The duties of the office remained essentially the same till its abolition on the remodelling of the EXCHEQUER in the present century.

**PENNI** (Finland). The hundredth part of the MARKKA (q.v.). F. E. A.

**PENNINGTON, JAMES** (1777-1862):

An economist, was the author of a paper on deposits with bankers, published in T. Tooke's *Letter to Lord Grenville on the Currency*, 1829, also of a letter further elucidating his opinions, to be found in Appendix C. of vol. 2 of Tooke's *History of Prices*, pp. 369-378. His views, expressed in 1827, contain the germ of the Bank Charter Act of 1844, but he was opposed to the separation of the departments of the Bank of England (BANKING; BANK NOTE). Pennington

further published a pamphlet, addressed to Mr. Finlay, on *Corn Laws*, 1840, and a work of authority on *The Currency of the British Colonies*, 1848, 8vo.

[*Annual Register*, 1862, p. 390.—*Economist*, 19th April 1862.] H. E. E.

**PENNY** (English). The Anglo-Saxon penny was a silver coin, 240 of which weighed a pound (5760 grains), twenty-four grains, the weight of a penny being then, as at present, known as a "penny-weight." The origin of the term penny is obscure, but in all probability it was derived from *pendo* (to weigh). The word was variously spelt in Saxon and Norman times, i.e. penig, pening, penning, peneg, pending, etc.; its modern representatives being but slightly different: *English*, penny; *German*, pfennig; *Danish*, penge; *Finnish*, penni.

The successive alterations in the legal weight of the silver penny, from the time of the conquest onwards, as given by Ruding, are shown in the following table. The last silver penny coined for general circulation was struck in the reign of Charles II., after which time these coins were issued only as a part of the special moneys distributed on Maundy Thursday (see MAUNDY MONEY).

SILVER PENNY.

Reign.	Weight.	Value.	
		In silver 925 fine, at 5s. 6d. per oz.	In silver francs 900 fine.
	grains.	penny.	franc.
William I., 1066 .	22½	3·09	·299
Edward I., 1300 .	22	3·02	·293
" III., 1344	20½	2·78	·270
" " 1346	20	2·75	·266
" " 1351	18	2·47	·240
Henry IV., 1412 .	15	2·06	·200
Edward IV., 1464.	12	1·65	·159
Henry VIII., 1527	10½	1·44	·139
" " 1543	10	1·37	·133
Edward VI., 1552.	8	1·10	·106
Elizabeth, 1601 .	7½	1·06	·103

A gold penny was struck in the reign of Henry III. (1257), weighing 45 grains of fine gold. It was rated as the equivalent of twenty silver pence. Measured by the present gold standard (1 oz. = £3 : 17 : 10½) its value would be as much as 7s. 11½d.

The first copper penny, a piece weighing 1 oz. avoirdupois, was struck in the reign of George III. (1797) (see COPPER MONEY, ENGLAND).

## PENSIONS.

Pensions, General Character, p. 88; Perpetual or Hereditary Pensions, p. 89; Civil Service Pensions, p. 89; Political Pensions, p. 90; Judicial Pensions, p. 90; Civil List Pensions, p. 90; PENSIONS, OLD AGE, p. 90.

A pension, according to Dr. Johnson's famous definition, was in England "generally understood to mean pay given to a state-hireling for

treason to his country." This would not have been true of the pension which Johnson himself subsequently received, nor of a considerable, though perhaps not the largest, portion of those granted in his time; it would not now be true of any. A modern pension is as much a payment for undoubted services as salary or wages, the difference being that pensions are paid in respect of *past*, salary or wages in respect of *present*, services. In England a certain number of persons in private employment, and the majority of persons in government employment, are remunerated partly by salary or wages, and partly by deferred pay in the shape of pensions. When, therefore, the conditions of service include a right to pension, the salary or wages must be assumed to be less than the full market rate, the difference representing the value of the pension.

The total cost of the pensions, and of gratuities in lieu of pensions, in the services of the crown in the United Kingdom, is known as the non-effective charge of those services. In the estimates presented to parliament for the financial year 1907-8, the proportion of non-effective charges was as follows, viz.:

	Total Charge.	Non-Effective Charge.
Army . . .	£27,272,000	£3,596,000
Navy . . .	31,419,500	2,510,800
Civil Services and Revenue Departments . . .	50,732,785	2,071,501

Besides the amounts thus annually submitted to parliament, which is at liberty to vote or not to vote them without any breach of positive law, there are certain pensions, charged by statute on the consolidated fund, for judicial officers and certain others, whose independence is deemed to be better secured by this arrangement. The total amount issued for pensions out of the consolidated fund during the financial year 1906-7, was £177,468. A complete list of such pensions, with the names of the recipients, is set forth in the annual "finance accounts," published by authority.

*Perpetual or Hereditary Pensions.*—The British government formerly rewarded eminent public services by the grant of a pension, usually accompanied by a peerage, and payable not only during the life of the original grantee, but to his heirs for ever. Thus hereditary pensions were granted to the first Duke of Marlborough, to Lords Exmouth and Rodney, and to the brother of Lord Nelson (after the death of the latter at Trafalgar); payable in perpetuity to all heirs of the original grantees to whom those titles should descend. In the Stuart times royal favour was sometimes signalised in the same way. Thus hereditary pensions were enjoyed down to the present day by two peers, as the heirs of natural sons of Charles II. Some years ago the late Mr. Bradlaugh, M.P., inveighed against these perpetual payments, and a committee of the House of Commons was appointed to enquire

into the subject. A treasury minute presented to the House on 20th July 1888 (House of Commons paper 292 of 1888) sets forth the recommendations of this committee, and the extent to which they had been adopted by the government. Steady progress has since been made with the process therein indicated of commuting hereditary pensions, by arrangement with those interested, of course at a fair market value; and the only pensions now (1907) remaining, which have a currency beyond the lifetime of the present recipients, are those to the heirs of the Duke of Schomberg (£720), to Lord Rodney (£2000), and to Earl Nelson (£5000)—in all £7720, chargeable on the consolidated fund.

Army and navy pensions, or, as they are officially termed, *retired pay*, are granted by the secretary of state for war and the lords commissioners of the admiralty respectively, according to conditions prescribed by royal warrant for the army, and by orders in council for the navy. These conditions may be varied by the sovereign from time to time by amending warrants or orders in council, but so long as they remain in force they cannot be departed from in any particular at the pleasure of the executive. The retired pay of the officers, non-commissioned officers, and men of the army and navy depends on the rank attained by the recipient and on the length of his service, with special additions for wounds received in action, or for physical breakdown caused by the nature of the service. There is, also, a strictly limited number of special pensions for distinguished service, known as "good service pensions." No infirmity or unfitness for duty is necessary, as in the case of the civil service, to enable retired pay to be granted in early middle life, as the *men* are discharged on the completion of their term of engagement, while *officers* are automatically placed on the retired list on reaching certain ages, which vary according to the rank of the officer.

*Civil Service Pensions* are granted by the treasury under conditions prescribed by act of parliament. The acts dealing with the subject are very numerous; the principal are the superannuation acts of 1834, 1859, and 1887, especially the act of 1859 (22 Vict. c. 26). Of this act, which governs the great majority of civil service pensions, the main principles are as follows, viz. (a) pension only to be granted on the attainment of sixty years of age, or on the abolition of the office, or on an officer becoming permanently incapacitated, by infirmity of mind or body, for duty; (b) after less than ten years' service no pension to be granted, but a gratuity of a month's pay for each year of service; (c) for ten years service or upwards the rate of pension to be not exceeding one-sixtieth of the retiring salary or wages for each year of service, subject to a maximum of two-thirds of such retiring salary or wages; (d) the full rate of pension not to be granted unless upon a certificate from the authorities of an officers' department to the effect that he has served "with diligence and fidelity, to their satisfaction"; (e) any officer to whom a pension is granted under the age of sixty to be liable to serve again if required.

When a civil servant—an expression which includes, for pension purposes, such widely different classes as *e.g.* consuls, clerks, postmen, and workmen in dockyards—is injured, without his own default, on duty, and from some accident arising from the nature of his duty, the treasury is empowered by the Superannuation Act of 1887 to make a special addition on that account to his pension, or to award him a gratuity, by way of compensation, in cases in which no pension can be granted. If he dies from the injury, a pension can be awarded to his widow, or to his mother, if he leaves no widow, and if his mother was wholly dependent upon him.

All persons serving in public civil departments are not entitled, without distinction, to pensions. A considerable number are engaged at the full market rate of wages, without any pension rights. By the Superannuation Act of 1887 already referred to, the treasury is empowered, subject to certain conditions, to award gratuities to such persons, on the termination of their employment, at the rate of a week's pay, or one pound, whichever is greater, for each year's service.

Certain classes of pensions deserve special notice: (1) *Political Pensions*—These may be granted to persons having held certain high political offices, such as that of first lord of the treasury, chancellor of the exchequer, secretary of state, president of the board of trade, or any other of what are generally known as ministerial offices. The pensions are of three classes. A first-class pension is £2000 a year, a second-class £1200 a year, and a third-class pension £800 a year. The class of pension awarded depends on the office held, and on the length of service therein. No award can be made unless upon a declaration that the recipient's other resources are not sufficient to maintain his station in life. Only one political pension can be granted in any one year, and the total number in force at any time must not exceed four of each class. The awards are made by the treasury, under the political pensions act of 1869, and are charged upon the consolidated fund. (2) *Judicial Pensions*—Any judge, on completing fifteen years' service, or on becoming permanently incapacitated for duty, whatever the duration of his service, may be granted a pension equal to two-thirds of his salary, chargeable on the consolidated fund. (3) *Civil List Pensions*—These pensions are granted by the sovereign upon the recommendation of the minister, generally the first lord of the treasury, and paid out of a special sub-head of Her Majesty's civil list. The limit of pensions to be granted in any one year is £1200 per annum. Under the act 1 & 2 Vict. c. 2, § 6, the pensions are to be granted to "such persons only as have just claims on the royal beneficence, or who by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science and attainments in literature and the arts, have merited the gracious consideration of their sovereign and the gratitude of their country." (4) *Old Age Pensions*—A movement has grown into prominence of recent years in favour of a system of pensions in old age for the whole

community, or at all events for the less affluent majority thereof. No scheme has as yet been authoritatively propounded, though the question was referred to a committee of experts. The difficulties of the problem are gigantic. (See PENSIONS, OLD AGE.) J. P. C.

## PENSIONS, OLD AGE.

England, p. 90; Mr. C. Booth, p. 90; Modifications of Mr. Booth's plan, p. 90; Contributory Schemes, Canon Blackley, Mr. Jos. Chamberlain, p. 91; Germany, p. 91; Denmark, p. 91; France, p. 91.

*England.*—The case for some scheme of old age pensions can hardly be put more forcibly than in the words of the report of 1895. "It appears from existing statistics that nearly 20 per cent of the total population above the age of sixty-five receive relief in one day, and nearly 30 per cent in the course of one year. If, however, a deduction be made from the total population of those belonging to classes which are not likely at any time of their lives to be in want of relief, it is evident that the percentage of those actually relieved to the population below the well-to-do must be greatly increased." In order to meet this large amount of aged pauperism a number of schemes for state-aided or state-provided pensions for old age have been laid before the public.

*Mr. C. Booth's Scheme.*—The most complete and comprehensive of these is that suggested by Mr. Charles Booth. His proposal is, that, subject to certain limitations, every person, male or female, on attaining the age of sixty-five, shall be given for the remainder of life a sum of 5s. weekly, out of public funds. He contends that this amount will not be sufficiently large to discourage thrift, while the fact that it is offered to all alike on the single condition of having attained the age of sixty-five, will avoid the necessity of invidious and difficult distinctions between rich and poor, or deserving and undeserving. Moreover, unlike the contributory schemes, it will at once reach the class which is most in need of help. The first and most important objection to this scheme is its enormous cost. Mr. Booth himself admits that the annual expense in England and Wales would be nearly £18,000,000. If Scotland and Ireland were added they would reach £24,500,000, while the direct saving as regards poor-law expenditure upon the aged is not estimated at more than £2,000,000. These figures alone seem to place the scheme beyond the range of practical politics, even if it were free from the economic objections which have been raised against it. Moreover, the absurdity of paying 5s. a week to the wealthy is obvious, yet it seems impossible to draw a line which would not lead to that further separation of classes and masses which it is the main object of such a scheme to avoid. There are also minor objections, such as the difficulty of obtaining satisfactory proof of age, and the complicated and probably costly system of administration which so large an undertaking would involve.

*Modifications of Mr. Booth's Plan* have been suggested by Mr. Hardy and Mr. Leslie Probyn, who propose that the pension-right should be recognised only for the proved impecunious aged, or, Mr. Probyn's amendment, by supplementing the income of any acquired property up to some reasonable limit. The pension is estimated at 10s. a week, and the pensioner must be over sixty-five and must give up all work. The chief objections to this are that so large a pension, from which savings would be deducted, would materially lessen the stimulus to thrift, and that in all probability very few aged persons would work if they could obtain 10s. a week on the sole condition of not working. The first should be a fatal objection to any scheme, and the second seems to show that the expenses would be little less and the advantages scarcely greater than those of Mr. Booth's plan. Other proposals have been made by Rev. Frome

Wilkinson and Mr. Bartley, M.P., but both involve an enormous amount of discrimination and investigation as well as very heavy expenses.

*Contributory Schemes.*—Canon Blackley had earlier (see 1887 *Inquiry*), advocated a scheme of compulsory insurance, by which all young persons from eighteen to twenty-one should be required to contribute to a state-collected or state-secured fund, a sufficient amount to entitle the contributor to a pension at some fixed age. In considering this, it is evident that a compulsory scheme must be universal, and that it is practically impossible to obtain contributions from those who are unemployed, or only in casual employment. It is also probable that such a scheme would be exceedingly unpopular with the working classes, even if the amount required were within their scope.

The most important of the contributory schemes is that associated with Mr. Jos. Chamberlain's name. This contemplates three classes of pensions. The first, a pension of 6s. a week, payable at sixty-five, is obtained by the payment of a lump sum of £2:10s. before twenty-five, and subsequent annual payments of 10s. for forty years. The state credits each contributor at 25 with a bonus of £10, both sums accumulate at compound interest and provide the annuity of £13 per annum at the age of sixty-five. Payments of the second class, which are twice as large, provide not only for the pension of 5s. but also for certain other benefits, of which the most important are payments to widows and children in case of death. The third case provides "that any person after depositing 80s. if male, 25s. if female, into the post office, and insuring in any society for £6:10s. or £3:18s. respectively, shall have his or her pension doubled at sixty-five by the state," and aims at securing the co-operation of the Friendly Societies. The main objections to Mr. Chamberlain's scheme are, (1) that it would not affect the classes which are most in need of help, and would merely act as a new form of insurance for those who are already able to provide for old age. (2) The scheme would have no direct effect for forty years, and if any measure at all is required it is one which can come into speedy operation. (3) The expenses of administration would be exceedingly heavy. (4) With regard to the third case, the friendly societies regard any scheme of state subvention with extreme suspicion, as likely to involve state interference, and their influence is too important to be disregarded.

It appears then that no scheme hitherto laid before the public is free from very grave objections. The question remains whether any scheme of state pensions is really necessary, or whether, on the other hand, it is not possible to hope that existing institutions will furnish the true solution of the problem. In the first place, the statistics of old age pauperism are somewhat misleading, for (1) a considerable number of applications may have been made by one person, (2) much aged pauperism is due to chronic infirmity which needs special care, and cannot be treated outside the workhouse, (3) more than two-thirds of the whole number of aged paupers are receiving out-door relief, and no doubt many of these ought to be maintained by private endeavour. The annual reports published by the local government board show a marked and steady decrease in the numbers of paupers, due both to improved economic conditions and to stricter administration of the poor law. Much, probably, is to be hoped from careful administration, together with the co-operation of the poor-law authorities with charitable institutions, as at Whitechapel, St. George's-in-the-East, or Brixworth; and evidence shows that charity, both private and endowed, is directly stimulated by strict administration. The amount available from endowed charities alone is estimated at nearly £100,000 per annum, and that from voluntary charity is also extremely large, while the value of voluntary work in charity organisation can scarcely be overestimated.

While well-directed charity and careful administration may be expected to do much for the poorest classes, those which are slightly better off profit much and might profit more by friendly societies. Evidence shows that there is practically no class which cannot afford to belong to a society, and if members begin to insure at an early age the payment required is exceedingly small. Should an effective demand for pensions arise, the great friendly societies, the management of which is steadily and greatly improving, are admirably adapted to meet it. Most trades unions provide super-

annuation for their members, the number and scope of thrift agencies, such as building societies or co-operative societies, is steadily increasing, while the post office provides facilities for the purchase of annuities or for small savings. A committee of experts—Lord Rothschild (chairman), Sir F. Mowatt, Sir C. Boyle, Sir Spencer Walpole, Mr. Finlaison, Mr. Brabrook, Mr. George King, Mr. A. W. Watson, and Mr. A. Chapman—considered the whole question, and their report (1898), on the whole, was unfavourable.

*Germany.*—The German scheme, which came into operation under the law of May 1889, makes insurance compulsory, broadly speaking, upon all wage-earners, while certain other classes have the option of insurance (for particulars see *Insurance, State (Germany)*). The scheme is worked by means of insurance cards through the post office, and great care has been taken to avoid over-centralisation, the main burden of administration falling on local institutions. Time alone can show how the experiment will work, but the *prima facie* difficulties seem to be the extreme complication of the procedure and the comparative inadequacy of the results. The pension is very small; contributions cannot be exacted from the casual or irregular worker; and no provision is made for widows and married women.

In *Denmark*, under the law of 1891, pensions are awarded only to persons who can prove that during the previous ten years they have been neither in receipt of poor-relief nor convicted of mendicancy. They must be over sixty and in genuine need of help. The amount of the pension is not fixed, and the scheme is administered by the communal councils, the expenses being divided between these bodies and the government. The system seems to be little more than an extension of out-relief, with the usual disqualifications attaching to poor-law relief, but, as with the German scheme, time alone can show whether the experiment will prove successful; and the results of both will be watched with great interest.

In *France* various proposals and suggestions have been made, and M. Méline has recently (October 1897) promised legislation on the subject, but his scheme has not advanced beyond the stage of political programmes, and no details have yet been given.

## PENSIONS IN THE UNITED STATES.

The pension system of the United States had its origin in the revolutionary war in the half-pay provisions made for officers. Early in the war, under the advice of General Washington, provision was made that all commissioned officers who should serve throughout the war, take an oath of allegiance to the United States, and reside in the country, should receive half-pay for seven years after the close of the war, provided that they held no office of profit under the states. In 1780 the act was extended to the widows and orphans of those who died during the war; and in that same year the period of half-pay for life was changed to full pay for five years, the sums being paid in interest-bearing certificates that soon depreciated in value.

Besides this provision of the general government for officers, some of the states, notably

Pennsylvania, had made similar laws. In 1785 congress suggested that the states provide pensions for invalids; and three years later the United States agreed to give credit to the states "for such sums as may become due to invalids." In 1808 the central government finally assumed the pension obligations of the separate states.

The principle adopted was that all persons disabled in the service—whether regulars, volunteers, or militia men, soldiers or sailors, under the United States or the separate states—should be pensioned. Safeguards against fraud were made, and on the whole well maintained. In 1818 a demoralising measure was passed, giving pensions to all soldiers of the revolution "who, by reason of reduced circumstances, shall stand in need of assistance from their country for support," provided that they had served in the army at least nine months. Wholesale frauds followed. 27,948 persons applied for relief; over 18,000 claims were allowed. Men who had never served, men who deeded away their property in trust, or gave it to their children, were put on the list. Finally the expense and the abuse became so great that, in 1820, Congress passed a new law with stricter requirements for examination, which caused one-third of the new pensioners to be stricken from the rolls. Later laws produced more abuses, to which President Jackson in his message of 2nd December 1834 refers; but the chief evil came from the above-mentioned act of 1818, which had a very great pauperising effect, in addition to the unexpected burdens laid upon the treasury.

After the civil war, pension legislation repeats the history of the earlier times; but the number of pensioners is so much greater that the sums of money involved are enormous, and the danger of political corruption great. At first the general principle followed was that all, regardless of rank, "wounded or disabled while in actual service," should be cared for at the public expense. This principle was extended, naturally, to cover also those dependent on the soldier. The amount granted for total disability ranged from \$8 to \$30 per month, according to the official rank of the pensioner. Some acts were passed granting definite sums for specific injuries, and these were from time to time increased, e.g. :—

	Per month.
1864. For loss of both feet. . . . .	\$20
1866. Loss of both feet or both hands, or sight of both eyes, or such disability from other causes as required the personal attendance of another person . . . . .	25
1872. This increased to . . . . .	31.25
1874. " " . . . . .	50
1878. " " . . . . .	72
1879. Those becoming totally blind from war causes . . . . .	72
1889. Those losing both hands . . . . .	100

Similar changes were made in other respects, as well as specific provisions for artificial limbs, trusses, etc.

January 25, 1879, the so-called "Arrears of Pensions" Bill became a law. This provided that pensions granted before or after the passage of the act should commence from the date of death or discharge from the army of the person on whose account the pension was granted. In many cases this added a round sum of hundreds or even of thousands of dollars to pensions lately granted. The prize was so great that within the next eighteen months more than 170,000 new claims were filed, and the expenditure for pensions leaped from some \$33,000,000 annually to more than \$60,000,000 within five years, with a steady increase to nearly \$90,000,000 in 1889.

In 1890—largely probably as a result of political pressure and the fear of offending the old soldiers and their friends if the bill were not passed—the Dependent Pension Law went into effect. This provided that "all persons who had served . . . ninety days or more . . . and who were suffering from a mental or physical disability of a permanent character, not the result of their own vicious habits, which incapacitates them from earning a support by manual labour," were to be pensioned at from \$8 to \$12 a month, in proportion to the degree of their disability. The first commissioner of pensions after the passage of this act, by a very liberal ruling, included under it specific disabilities, and the "capacity of a claimant . . . to perform manual labour was no longer even considered in adjudicating his claim." The expenditures increased very rapidly. In 1892-93 the amount paid for pensions exclusive of office expenses was \$158,740,467.14. For 1895 the total estimates, including surgeons' and agents' expenses, were \$162,631,570.

A new commissioner of pensions in 1893, believing that many pensions had been illegally granted under the act of 27th June 1890, appointed a board of revision to examine the cases allowed under that act, and many fraudulent cases have been found and the pensions withdrawn. For the year ending 30th June 1896 the commissioner estimates the needed expenditure for pensions at \$148,000,000.

Liberal as the United States have been in thus granting pensions, the demoralisation wrought by so many liberal acts and by the appeals of pension agents has led to a vigorous demand, which it is hardly likely will be granted, for a law granting a pension to every person who had been sixty days or more in military or naval service.

Besides the general laws, special laws by the thousands have been passed granting pensions to those not receiving them under the general acts, or increasing the sums allowed them. In

one day, 3rd March 1891, ninety-six such bills became laws.

Of late years ex-presidents' widows have been given pensions—first Mrs. Lincoln, then Mrs. Garfield, Mrs. Polk, Mrs. Tyler; and retired judges of the U.S. supreme court receive them. There has also been discussion of pensions for the life-saving service, railway mail clerks, etc. But the country has on the whole limited its pensions to those who have served in the army and navy. J. W. J.

PÉRAVY, DE. See ST. PÉRAVY.

PERCEVAL, SPENCER (1762-1812), English statesman and financier, was the second son of the second Earl of Egmont. He entered parliament for Northampton in 1796, and became a strong supporter of W. PITT.

When Pitt succeeded Addington, Perceval, who had been solicitor-general to the latter, again accepted office as attorney-general. He declined to prosecute the members of the early trade-unions at the instance of the employers, on the ground that he was unwilling to commit the government to a uniform support of the employers on trade questions. He cordially supported Wilberforce's endeavours to remedy the abuses of the Guinea slave trade. Perceval devoted much attention to financial questions, and took a conspicuous part in the debates on the financial irregularities which led to Lord Melville's impeachment. On the death of Pitt (1806) he resigned; but he still took an active part in parliament.

In the Duke of Portland's ministry, formed 31st March 1807, Perceval became chancellor of the exchequer. After a dissolution the ministry returned greatly strengthened. He was successful with his first budget, and his scheme for the conversion of 3 per cent stock into terminable annuities was generally approved.

On the death of the Duke of Portland in 1809, Perceval became prime minister, retaining his old post of chancellor of the exchequer. The ministry was weak, and the times critical. Military and fiscal troubles followed on each other in quick succession. England was required to pay for the Spanish army in the Peninsular war, when she could scarcely pay for her own, and gold payments were demanded when gold was extremely scarce. Perceval struggled bravely against his difficulties, which were aggravated by a powerful opposition.

The budget demands in 1811 revealed the serious condition of the national finances. The chancellor's proposals included a grant of £2,100,000 for Portugal, and the ministry acceded to the recommendation of the select committee on commercial credit that £6,000,000 should be advanced to the manufacturers suffering from the over-speculation of previous years. When HORNER proposed resolutions in favour of

the resumption of cash payments, Perceval successfully resisted them. A bill was passed in July making bank-notes legal tender, avowedly because gold was so appreciated that for currency purposes it was unprocurable, while bank notes were worth only 80 per cent of their face value.

Though Perceval now appeared to be in a strong position, difficulties soon arose. His opposition to popular reforms greatly weakened his ministry, and his policy on the ORDERS IN COUNCIL dealt it an almost fatal blow. The unwisdom of these orders had long been apparent, and it was contended that instead of injuring France they were rapidly destroying English commerce.

In the midst of his struggle against almost overwhelming odds, Perceval was assassinated by a deranged bankrupt named Bellingham, as he was entering the House of Commons on 11th May 1812. He was a man of stainless personal character, but narrow in his views and mediocre in his abilities. Nevertheless, he had a dogged persistency that carried him through crises which would have daunted abler men. As a financier he wanted originality, but framed his policy according to the dictates of expediency and opportunism.

[Alison, *Europe*.—Spencer Walpole, *Life of Perceval*.—*Dictionary of National Biography*, vol. xlv.—Jesse's *Memoirs of George III*.—Massey's *History of England*.—The Duke of Buckingham's *Memoirs of the Regency*.] G. B. S.

PERDIGUIER, AGRICOL (1805-1875), originally a working man, was elected a representative to the French national assembly of 1848.

He wrote three books on French *Compagnonnages*, or local groups called *Devoirs*, of itinerant artisans confederated by crafts into general associations covering the whole of the country—many groups had in secret survived their abolition by law in 1791. The principal is the *Livre du compagnonnage* (1837), in which he gives their history, disentangled from several rather mythical stories as to their origin, describes the local institutions with their ceremonies and pass-words, and entreats them to stand firmly together—warning them against some abuses which had sprung up in the course of time. He also wrote *Une scission dans le Compagnonnage* (1846), and *La question vitale du Compagnonnage* (1861). Perdiguer was intelligent and clear-headed, deservedly esteemed by his fellow working-men. E. CA.

PEREIRA, GREGORIO PIETRO (18th century). Was a priest of Portuguese extraction. He wrote a treatise on money and commerce, read at the academy of Ravenna, 1757.

He follows the theories of MELON and shows the influence of PUFENDORF and LOCKE. He accepts Locke's idea of money and his theorem that the amount of metal in a coin alone constitutes the measure of its value. He shows the disadvantages produced by monetary alterations, and examines the means possessed by

states for increasing gold and silver and concludes that these are conquest and commerce.

He advocates the maintenance of a favourable BALANCE OF TRADE (*q.v.*), and places this in the predominance of exports over imports, the development of the navy, agricultural industry and manufacture, and the increase of national products.

*Dissertazione sopra la giusta valuta della moneta e la necessità del commercio per arricchire gli stati. Faenza, 1757.*

[Graziani, *Le idee economiche degli scrittori emiliani e romagnoli, etc.* Modena, 1893.] U. R.

PEREIRE, ÉMILE (1800-1875), was in his youth one of the most devoted of the St. Simonians (see ENFANTIN; St. SIMON), and a contributor to their journal, the *Globe*. He also wrote in the *National* and the *Revue Encyclopédique*. After the dispersion of the St. Simonian school, he, like most of its members, showed himself a very enterprising and active business man. With the co-operation of his brother, Isaac PEREIRE (*q.v.*), also earlier in life a St. Simonian, he constructed the first line of railway in France, between Paris and Saint Germain, and later contracted for the main lines of the *Compagnie des Chemins de Fer du Nord*. In 1852 the two brothers jointly founded the *Société Générale du Crédit Mobilier*, which gave a wonderful impulse to great financial and industrial enterprises both in France and elsewhere.

Émile Pereire published in separate form:—*Examen du Budget de 1832. Réformes financières . . . moyen de supprimer les impôts du sel, des boissons, du tabac et la loterie* (1831).—*De l'assiette de l'impôt; examen critique de travail de la Commission de la Chambre des Députés sur le budget des recettes* (1832).—*Considérations sur les Finances de la France et des États Unis* (1832). These belong to his St. Simonian days, and are republished from the *Revue Encyclopédique*.

[G. Weill, *L'Ecole St. Simonienne*, 1896.]

PERI, GIOVANNI DOMENICO, a rich and learned merchant of the first half of the 17th century, desired, as he says in his preface, "to communicate to the world some collections about the establishment and maintenance of his business," which were originally intended for his sons Girolamo and Tomaso, successors to their father's business.

These collections he printed in his *Negoziante*, a work which, however, has much wider aims than

the author would lead us to believe. It is a technical handbook for merchants, to teach them trading and book-keeping, treating at much length of the method of mercantile accounts called the system of double entry. It contains also interesting historical notices on the exchanges between the principal Italian and foreign cities, explained in twenty statements in the second part. Following the impulse given to comparatively liberal opinions in public economy and commerce, as by SCACCIA, STRACCA, and other followers of commercialist doctrines, Peri demonstrates the importance of merchants, and pleads for them and commerce. He treats also of mercantile contracts, giving all the necessary explanations for entering into them conformably with the ideas of the juriconsults of his epoch. The work is divided into four parts, and is still interesting, especially for the history of the mercantile customs of those times.

*Il negoziante*, Genoa, 1638, and Venice, 1672, parts i. and ii.; 1673, parts iii. and iv., presso Gio. Giacomo Herz.

A. B.

PERICULUM SORTIS. This term is used by mediæval writers on usury to describe the danger on the score of risk to which a man might expose himself by lending money. Although usury and interest, in the modern sense of the term, were forbidden, exceptions to and evasions of the strict letter of the law became increasingly common; among others we find payment widely taken on the ground of *periculum sortis* in cases where an individual incurred a distinct risk of losing his loan altogether; or, where he was inconvenienced by the failure of a borrower to return it at the stipulated time.

[Ashley, W. J., *Introduction to English Economic History*, i. (1892).—Cunningham, W., *Christian Opinion on Usury* (1884).—Cunningham, W., *Growth of English History and Commerce* (1890).]

E. A. M.

PÉRIER, CASIMIR (1777-1832). Originally an engineer officer, he left the army in 1802 to found a bank. Under the government of the Bourbons, he was in the Lower House, and a steady opponent of the reactionary measures passed during their reigns; after the revolution of 1830 he became minister of the interior, and held this post at the time of his death.

His *Réflexions sur le projet d'emprunt* (1817), and his *Opinion sur le projet de loi relatif au remboursement et à la réduction des rentes* (1824), were directed against foreign loans and the conversion of state loans. In 1838, a collection of his speeches was published under the title of *Opinions et Discours de M. Casimir Périer* (4 vols.) with a prefatory notice by M. de Rémusat.

E. ca.

PERIODICITY OF CRISES. See CRISES.  
PERIOT (or PERIT). A fractional part of the troy grain formerly used in calculating the value of the precious metals, but not actually existent as a weight. Taking the standard troy pound as a unit, the subdivisions were as follows:—

1 Troy pound	= 12 ounces
1    ounce	= 20 pennyweights
1    „ pennyweight	= 24 grains
1    „ grain	= 20 mites
1    „ mite	= 24 droites
1    „ droite	= 20 periot
1    „ periot	= 24 blanks

The periot, therefore, was equal to  $\frac{1}{24}$ th grain, and the smallest subdivision, the blank, to  $\frac{1}{24 \times 24}$ th grain. As no weight less than about  $\frac{1}{24}$ th grain is appreciable on a good assay balance of the present day, it is evident that no such weights as the above could actually exist, and there can be little doubt that they were used in calculating the value of bullion in bulk in the same manner as we now use decimals. Thus the schedule to the Coinage Act 1870 gives the weight of a sovereign as 123.27447 grains, but if the weight be calculated from the data given in the note to the schedule (934 sovereigns and one half-sovereign in a pound troy of standard gold), it is seen that this is only an approximation, the exact weight being indeterminate (see GUINEA), and, where minute accuracy is aimed at, the number of decimal figures used will depend on the multiple of the sovereign under consideration.

It is not possible to state precisely when these weights were first introduced, or when their use was discontinued, but they are referred to in an old manuscript volume in the Royal Mint library, entitled *Mint and Moneta*, which bears no date, but appears to have been written during the latter half of the 16th century, as "only used by the goldsmiths for the making of an assay of gold and silver." They are also used in an act of Queen Elizabeth (43 Eliz. 1601) in defining the weights of silver coins, and for a similar purpose in regard to both gold and silver coins in an act of the Long Parliament (see Scobell's continuation of Pulton's *Acts and Ordinances*, 1640-57, under date 1649 c. 43, *Moneys and Coins of England*). References will be found to them also in various modern text-books (Chaffer's *Hall-Marks on Plate*; Kelly's *Universal Cambist*; Ruding's *Annals of the Coinage*; Chaney's *Our Weights and Measures*. It is interesting to note that three of the names used for these subdivisions of a grain are those of ancient coins; also that they are alternately one twentieth and one twenty-fourth, as in the case of the ounce, pennyweight, and grain at the present day.

E. R.

PERMIT, a license or writing granted by the officers of the excise certifying that the duties on certain goods have been paid, and authorising or permitting their removal from one place to another. Previous to 1848 all spirits sent out by spirit dealers were accompanied by permits, but by the 11 & 12 Vict. c. 121, an excise certificate was substituted for the permit. This provision was extended to the removal of spirits by rectifiers and compounders by the 23 & 24 Vict. c. 114.

The use of permits is at present restricted chiefly to the removal of duty-free malt and of

spirits from distillers' spirit stores or from duty-free warehouses.

Permits and certificates are regarded as a valuable means of identifying articles on transit, and of distinguishing those upon which the duties have been paid from those upon which duties have not been paid. They also afford a means for checking the receipt of illicit spirits, and of preventing a fraud on the revenue laws.

PERPETUITIES, RULE AGAINST. The rule against perpetuities is intended to prevent the tying up of land or other property for an indefinite period. The love of power, and the wish to perpetuate the opulence and consideration of their families, has often induced owners of property, especially of landed property, to settle beforehand its devolution for as long a time as possible. But the English courts of justice have always endeavoured to limit this action in the public interest and to maintain freedom of trade in property. When the landowners procured the statute *De Donis Conditionalibus*, 13 Edw. I. c. 1, which made entailed land inalienable, the courts evaded the statute by means of the collusive actions known as fines and recoveries. When the Statute of Uses, 27 Hen. VIII. c. 10, contrary to the intention of those who enacted it, made possible new contrivances for guiding the devolution of landed estate, the courts again took alarm, and by degrees worked out what is now known as the rule against perpetuities. Under this rule, any disposition of landed estate, or other property, which is to be valid, must take effect within the period of a life, or lives, in being at the time when it was made, and twenty-one years afterwards, with an additional allowance for the period of gestation where the party entitled is a posthumous son. The practical importance of this rule, as ensuring the restoration of land sooner or later to free commerce, is vastly diminished by the fact that every tenant for life has now a statutory power of selling the settled land (see SETTLEMENT, LAND; ENTAIL, LAW OF).

In connection with the rule against perpetuities may be noticed the rule limiting the period during which the income of property, real or personal, may be accumulated for the benefit of the person or persons who will ultimately take that property. The rule is contained in the act 39 & 40 Geo. III. 98, popularly known as the *Thellusson Act*. A certain Mr. Thellusson had ordered in his will that the income of his estate should be accumulated during the lives of all his children and grandchildren alive at the time of his death for the benefit of some future descendants. Such a disposition did not contravene the rule against perpetuities, but it was felt to be unreasonable and contrary to public policy. It thus led to the passing of the act

above mentioned, which forbids the accumulation of the income of property for any period longer than the life of the grantor, and twenty-one years afterwards, with an allowance for the period of gestation where the person who is to take is still unborn at the death of the testator. Any direction to accumulate income, which contravenes the act, is void for the time in excess of the period prescribed by the act. The income during such time is to be paid to the person who would have been entitled to receive it had there been no direction to accumulate. A further check on the accumulation of income for the purpose of purchasing land is imposed by the Accumulation Act 1892 (55 & 56 Vict. c. 58). (See THELUSSON.)

[Williams, *Principles of the Law of Real Property*, and *Principles of the Law of Personal Property*, and Lewis on *Perpetuities*.] F. C. M.

**PERSONAL PROPERTY.** Personal property is, roughly speaking, movable property; as real property is, roughly speaking, property in land. It consisted originally of movables or chattels in the strict sense, but its scope was afterwards extended. Certain interests in land which were of little consequence at the time when the definition of real estate became fixed, are described as *chattels real*, and treated as personalty. These include all leasehold interests and estates at will. Again, the right to enforce payment of a debt or to recover damages in an action at law are included in personalty under the name of *choses in action*. Personal annuities, money invested in the funds, the shares of most companies, patents and copyrights, are described as incorporeal personal property. Indeed many objects now included in personal property have hardly anything in common save that on the death of the person entitled to them, they pass to the executor or administrator, whilst realty before 1898 passed to the heir or devisee.

[Williams on *Personal Property*.] F. C. M.

**PERSONAL SERVICES** are those which are expended in guarding, conveying, or otherwise preserving (a) the objects of production; (b) the persons of the producers. These services may be, as SISMONDI observes (*Nouv. Princ. de l'Écon. Pol.*, p. 147), "of the most elevated as of the most menial kind . . . as for instance those of a physician . . . or those of a *valet de chambre*."

Economists differ as to whether the possession of such services may be rightly esteemed wealth, and as to whether those who render them should be styled productive or unproductive labourers. Adam Smith observes that "the labour of a menial servant . . . adds to the value of nothing" (*Wealth of Nations*, edited by McCulloch, p. 149). J. S. Mill, following his lead, writes of "domestic servants and all other unproductive labourers" (*Principles of Pol. Econ.*, ch. iii.), and sharply criticises McCulloch and J. B. Say for classing them as "productive." Again, in

his *Some Unsettled Questions of Political Economy* (Essay iii.), Mill distinctly repudiates the idea of domestic servants being productive labourers, yet, inconsistently, admits (cp. also Sismondi, *Nouv. Princ.*, p. 147) that most of such persons "occasionally, and some habitually, render services which must be considered as of a productive nature" (p. 85 *ib.*).

The French economists of the present century opposed both Smith and Mill. Thus J. B. SAY, referring to the consumption of wealth, observes that the most rapid consumption is that made *des services personnels* (*L'Écon. Pol.*, ii. p. 231; also quoted by Sandelin, *Répertoire Gén. d'Écon. Pol.*, art. "Consummation"). Sismondi thought them productive, yet he makes the confusing remark that "they only differ from productive labour in the fact that their results cannot be stored up" (*ib.* p. 147).

F. BASTIAT argued against both Smith's and Mill's reasoning. In his chapter on value, he examines the nature of a "service," laying stress on Say's doctrine—as old as Bacon—that there is really no such thing as creative or so-called "productive" human labour. Man can only combine or displace the forces and materials which already exist. It follows from this that all labour being equally "unproductive," the importance of any service is only a question of degree. Bastiat considers the services of soldiers, guards, etc., as "undoubtedly" "productive," "seeing that the sole object of the arrangement is to increase the proportion which the aggregate satisfactions of the community bear to the general efforts" (p. 146 *ib.*). He proceeds to argue that personal services have "value" quite independently of their transiency, and referring to those services which "vanish and leave no trace behind," he remarks: "The very same thing holds of personal services. The consumer makes the value disappear, for it has been created only for that purpose. It is of little consequence, as regards the principle of value, whether the service is undertaken to satisfy a want to-day, to-morrow, or a year hence."

Modern English economists have not all agreed with Bastiat. Prof. Alfred Marshall is, however, very decided on the question. Defining wealth as consisting of the desirable things a man possesses, he confines the term to a man's "external goods," but he extends this to include "personal services of all kinds" (*Principles of Pol. Econ.*, p. 106). Prof. J. E. CAIRNES (*Some Leading Principles of Pol. Econ.*, p. 25) brackets commodities and services interchangeably as wealth; but Prof. H. SIDGWICK (*Principles of Pol. Econ.*, bk. i. ch. iii. p. 78), going back to Smith's definition of wealth, places both sides of the question with almost equal force before his readers. "A man's money," he observes, "is not entirely . . . spent in consumable things . . . it is partly spent in what we may call 'consumable services,' i.e. utilities furnished

by the labour of others, 'which are not fixed and embodied in matter,' such as the services of domestics, physicians, actors, carriers. Ought we then to extend the conception of 'wealth' to include such services." . . . "If, as I think, the term wealth is by usage restricted to stores or sources of utility comparatively permanent, some other term must be found to include . . . what I have called directly 'consumable services,' . . . and I propose . . . to employ the terms 'commodities' and 'produce of labour' in this extended way." Prof. Sidgwick then goes on to raise the question which Bastiat discussed, and assumes that personal services "are not wealth, on account of their transiency" (*ib.* p. 79). Prof. Marshall (*Principles of Economics*, 1st ed. p. 110) observes that the inclusion of these does not often affect our discussions except in cases where there is a distinction between what is "wealth to the individual," and 'wealth to the society.'

It is, however, obvious that the personal services of what Sismondi happily calls *cette population gardienne* (*ib.* p. 141) are absolutely and directly indispensable to the production, the transfer, the circulation, and what is equally important, the protection and preservation, of wealth, and must therefore be classed as indirectly productive labour. A. L.

PESCATORE, MATTEO (1813-1879), was born at San Giorgio Canavese (Piedmont). He first taught civil law and then the philosophy of law at the university of Turin. He was a deputy in the sub-alpine parliament, and when the kingdom of Italy was constituted he became one of its senators. Deeply versed in judicial and social science, his work has left traces on education, legislation, science, finance, and the philosophy of law. In the teaching of law Pescatore introduced a rational, in place of an exegetical method. The law on the enfranchisement of long leases is due to his labours and work in parliament.

He left two important works, one on legal philosophy, *Logica del diritto*, the other on finance, *Logica delle imposte*. Turin, 1867. The latter is a comprehensive treatise on taxes, and displays thorough practical sense combined with incisive and original ideas as well as profound learning.

[A. Bertolotti, "Matteo Pescatore," in the *Rivista Europea*, Florence, 1879.] U. R.

PESETA—a diminutive of Peso, which was frequently used to denote the Spanish dollar—first appears amongst Spanish coinage terms during the 17th century. It was then, however, rarely used. It was a division of the dollar, and was applied to two different moneys of account, distinguished as

PESETA MEXICANA, which = 5 reals vellon,

PESETA PROVINCIAL, which = 4 reals vellon.

The coin representing this latter denomination,

usually called the PISTAREEN, was from 1700 onwards a familiar term in commerce, particularly in the West Indies; five of them went to the dollar, and they were, in 1717, valued by Sir Isaac Newton as 10½d. of English currency.

When, in 1876, Spain actually adopted the method and standard of the Latin union, she took the peseta provincial, which was roughly equal to the franc in value, as the unit of the new currency, and divided it into 100 centimos, to correspond with the French centime. The silver 5-peseta piece, like the 5-franc piece of France, became the largest silver coin, and the gold 25-peseta piece was the representative of the existence of a gold standard. But, owing to the absence from Spain of a sufficient stock of gold to keep the 5-peseta piece at its proper value, the peseta has been steadily falling in gold price for some years past, and at the present time (1907), instead of 25·22, about 35 are required in exchange for a sovereign.

[Kelly's *Cambist*, p. 319.—Chalmers's *History of Colonial Currency*, p. 395.—Browne's *Merchant's Handbook*, p. 58.] C. A. H.

PESO. See DOLLAR, MEXICAN, etc.

PESSIMISM. Like the term OPTIMISM, the term pessimism is used in a variety of senses. Properly it denotes the doctrine that, in the world as a whole, evil necessarily predominates over good. But it is often used loosely to describe the mood of those who are more alive to the evil than to the good of existence. Quite apart from any philosophic theory, differences of temperament and of circumstances will cause men to differ very widely in their estimate of life. Individual feeling admits of infinite gradations which defy classification. Pessimism and optimism in this popular use are terms of merely relative import. Pessimism as a principle has manifested itself in religious forms, notably in Buddhism, and in philosophical forms, the most modern of which are associated with the names of Schopenhauer and Hartmann. A critical examination of pessimist theories would altogether transcend the limits of this article. They have their origin in the undeniable and awful contrast between human aspiration and human attainment. No form of philosophic pessimism has at present exerted much influence on political economy. The CLASSICAL ECONOMISTS (*q.v.*) lived in an age of optimism and were in full sympathy with their age. They had a hearty faith in the unfettered energies of mankind. It is true that the theories of certain eminent economists, as MALTHUS and RICARDO, have been used to demonstrate that under existing conditions the state of the mass of mankind must steadily grow worse. The inference commonly drawn, however, was not that mankind were doomed by fate to suffer, but that the actual economic

system must be modified. Those who do not expect well-being to result from individual effort are confident that it can be produced by the action of the community.

The rising generation of economists may probably be less optimistic in tone. The very diffusion and intensity of the desire for comfort tend to produce a formidable discontent which may at first discharge itself upon obnoxious institutions or classes, but must finally break against the unalterable facts of nature. Certain characteristics of modern civilisation, notably the resulting prolongation of the lives of the weak, both in mind and body, and the heavy burthens imposed on the capable members of society, seem likely to retard progress as hitherto understood. The limits to the physical resources of our globe are becoming more apparent. Nearly the whole of its surface has been explored; the area which civilised man can occupy has been pretty well ascertained; the great forests are disappearing, the virgin soils are losing their spontaneous fertility, and mines are worked upon a scale which in many cases threatens exhaustion in no distant future (MINES AND MINERALS, EXHAUSTION OF). The assumption that mankind are destined to a practically infinite economic development is thus shaken. The economists of a past age were chiefly concerned with the advantages which would follow the destruction of artificial barriers; but the stringency of natural limitations which cannot be removed will probably attract more attention from the economists of the approaching time.

[J. Sully, *Pessimism, A History and a Criticism*.—W. Wallace, article on "Pessimism" in the *Encyclopædia Britannica*, and the authorities therein cited.] F. C. M.

PESTEL, FRIEDRICH WILHELM VON (1724-1805), was born at Rintelen (Lippe-Schaumburg), studied at Göttingen, became doctor *utriusque juris* (1747), and professor of law, first at Göttingen and afterwards (1763) at Leyden. He was dismissed from his office in 1795, when the revolution broke out; and then went to Germany, but returned in 1803 and remained at Leyden until his death. In 1792 he was ennobled by the Emperor.

His works mostly deal with law; the following, however, contain parts which are important in connection with economic study; *Gedanken von der Rechtmässigkeit der Reichsständischen Landposten und der Unerweislichkeit eines diese ausschliessenden fürstlichen Taxischen Reichspostmonopols* (Thoughts on the lawfulness of the posts managed by the different governments of the empire and the absence of evidence for the monopoly of the posts enjoyed by the Prince of Taxis), Rintelen, 1759.—*Fundamenta jurisprudentiæ naturalis delineata in usum auditorum*, L.B. 1773, 1774, Ultrap, 1776, translated into French (1775) and into Dutch (1783).—*Commentarii de Republica Batav.*, L.B., 1782 and

1798. The last work especially contains some remarks on trade and currency that deserve mention; they bear, however, for the greater part, the impress of the opinions of his time; the general ideas are mostly imbued with a moral and philosophical character. A. F. V. L.

PETER'S PENCE, called also Rome Scot. An annual payment made to the pope of Rome till the reign of Henry VIII. Its origin is almost lost in antiquity, but tradition says that it was instituted by Offa, king of Mercia, who, after a visit to Rome, ordered that every person having land or cattle of the annual value of 30d. should contribute a penny annually towards the support of the English college at Rome, the whole to be collected each year during the time between the feast of St. Peter and St. Paul and the first of August. Before the beginning of the 13th century Peter's Pence had been commuted for a fixed annual payment, about £200. Even this soon came to be looked upon as a papal exaction, rather than a free gift, and the threat of withholding it was a valuable weapon against papal aggression: when therefore in 1305 A.D. Clement V. tried to go back to the old system of a penny from each household, the attempt was stoutly resisted, and it was never again repeated. The term is still used as describing voluntary payments made to the Pope. The payment of Peter's Pence as a national gift was abolished in 1533 by 25 Henry VIII., c. 21.

PETIT SERJEANTY. See SERJEANTY.

PETITTI DI RORETO, CARLO ILARIO (1790-1850). Born in Turin of a noble family, he held important offices under the Piedmontese government, and occupied himself much with the duties of administration and economic study, discussing and proposing important liberal reforms in the state, and exercising a useful influence.

His principal work, on the best manner of dealing with beggars, will bear comparison with DE GERANDO's classic. In this book Pettitti discussed the precautions taken to prevent begging in different states, and the question of legal intervention. Another work on Italian railways, in which he studied the organisation of railways thoroughly, giving many useful statistics, was of great importance in Italy, as the first example of this kind of investigation at a time when great industrial questions were still not familiar in that country.

Pettitti wrote also on prison discipline (Turin, 1840), on children's labour (1841), customs unions (1844), reform in taxation (1844), and on many other subjects.

After his death another of his works was published, on the subject of the lottery. In this are collected facts from different countries, their laws on the subject, and the history of the different systems; he attacks government lotteries with much force. *Sul buon governo della mendi-*

cità, Turin, 1837.—*Delle strade ferrate e del migliore ordinamento di esse*, Capolago, 1845.—*Del giuoco del lotto*, Turin, 1853.

[P. S. Mancini, *Notizia della vita e degli studj di C. I. Pettiti di Roreto*, pubblicata come proemio all' opera postuma di questo sul giuoco del lotto.] U. R.

PETTY BAG, *Purva Baga*, was a division of the chancery records which was concerned with writs and returns in cases more nearly affecting the interests of the crown than those of the subject. These records date from the Tudor period, and include writs and returns of *Certiorari*, *Ad quod Damnum*, *Depopulations* and *Scire Facias*, etc. These might be classed as the political records of the chancery, that is, in so far as they refer to questions of state or public policy. The division, however, is very loosely made, and is not consistently observed.

For economic purposes these records are interesting as containing valuable and instructive returns of "Depopulations" under Elizabeth and James I.

A. L.

PETTY, SIR WILLIAM (1623-1687), political economist and statistician, born at Romsey in Hampshire, was educated to be a doctor, and graduated, 1649, in physic at the University of Oxford, subsequently at the College of Physicians in London. His active life may be divided into two periods. During the first, after a short tenure of the professorship of surgery at Oxford, he held several public appointments in Ireland, in connection with the survey of that kingdom and the subsequent distribution of the confiscated lands amongst the successful soldiery, after the conquest of the island by the Commonwealth. Petty enjoyed the confidence of the Cromwell family in a singular degree, and remained devoted to their memory to the last. In the second part of his career, after the overthrow of the Protectorate by the Republicans, and of the Republic by the Restoration, he devoted himself to the study of vital statistics and questions of trade and commerce, to which he gave the name of "political arithmetick" (see ARITHMETIC, POLITICAL). He enjoyed the good-will and protection of the king personally, though he was the object of dislike of the extreme court party, as he had been of that of the extreme republicans.

"By political arithmetick," says DAVENANT, "we mean the art of reasoning by figures upon things relating to government. . . . The art itself is undoubtedly very ancient; but the application of it to the particular objects of trade and revenue is what Sir William Petty first began. . . . He first gave it that name, and brought it into rules and methods" (Davenant, *Political Arithmetick*, Works, 1, 128, 129). In this sense Sir William Petty has, and not without reason, been called the founder of political economy.

Putting aside the works relating to the history of the Down survey, which are of exclusively historical interest, the first publication with which the name of Petty is connected is *The Observations upon the Bills of Mortality* of the city of London, published in 1662; a small book of about 100 pages, but bearing on the title-page the name, not of Petty, but of GRAUNT (*q.v.*). Whether Petty or Graunt was the real author has been the subject of much controversy. It is to be noticed that in a list of his writings—though not of his published works—found at Wycombe in his own handwriting, some "observations on the bills of mortality" are mentioned under the date of 1660, *i.e.* two years before the appearance of Graunt's pamphlet (*Life of Petty*, p. 318). It is not, however, stated that these observations were then published. On the other hand, in one of the two series of detached essays on "political arithmetic," published at various times between 1671 and 1687, Petty speaks distinctly of the earlier work as "Grant's book"; and in another he refers to his own essay the "Observations upon the Dublin bills" as the "'snuffers' to make the candle of the new light to the world given by the earlier book burn clearer."

Taking this list of facts into connection with the publication by Petty, in 1674, two years after Graunt's death, of a new and enlarged edition of the book, with the numerous parallelisms between the *Observations* and the *Treatise on Taxes*, published by Petty in 1662, with the general belief at the time, as evidenced by Evelyn and Burnet, that Petty was the author, and with the intimacy over a long period of Petty with Graunt, it can hardly be doubted that Petty had, to say the least, a large share in the work, and that the case is one of joint authorship<sup>1</sup> (*Life of Petty*, p. 180).

Of Sir William Petty's economic works, five have achieved a permanent reputation—the *Treatise on Taxes and Contributions*, published 1662; the *Discourse on Political Arithmetick*, written in 1671, but not published till 1691, after his death; and a tract entitled *Quantulumcumque concerning Money*, dealing with questions of currency, written in 1682; a tract entitled *Verbum Sapienti*, written in the last year of the first Dutch war, in 1665; and the *Political Survey or Anatomy of Ireland*, published anonymously in 1672. To these may be added the two series of detached *Essays on Political Arithmetick*, already alluded to, written at various times between 1671 and 1687. It has been well observed that all these treatises—none of which is of any considerable length—"are less akin to elaborate treatises than to essays throwing out hints and thoughts" (*Edinburgh Review*, No. 373, July 1895). The author shows a marked tendency to keep in view the practical aspect of

<sup>1</sup> See on this subject *Graunt or Petty*, by Professor C. H. Hull, Boston, 1896; and a *Dissertation on Sir William Petty*, by Mr. W. L. Bevan, Canterbury, 1893: *Life of Sir William Petty*, ch. vii.

questions, and to found his reasoning on observation and on facts gained through his own experience, rather than on those methods of deductive reasoning which were pursued by the economists of a later school. In this respect Petty's methods are far more suggestive of Adam Smith than of Ricardo; and they bring him into touch with the economists of the present day, such as Thorold Rogers and Marshall. "An opinion of what is possible to be done" is the heading of one of his papers, and the tendency to prefer the practical to the abstract is one of the strongest characteristics of his mind. It originated, no doubt, in his own early experience of the difficulties of the art of government in Ireland, and in his protracted and only partially successful struggles for reformed methods of administration, which brought him into collision with nearly all the different parties successively which governed the country under the Commonwealth and during the reign of Charles II., and no doubt impressed on his mind the necessity of compromise. If, however, his method was to collect facts and statistics, and to try to found general propositions upon them, he was perfectly aware of the deficient character of the statistics he had to use. Proposals for improving the public and official sources of information in this respect, in other words, for establishing a proper statistical department as part of the machinery of government, constantly recur in his pages, and the evils arising from the absence of a proper machinery for readily obtaining this class of information are powerfully enforced. It would not, however, be correct to say that no instances of the deductive method of reasoning are to be found in Petty's works. Thus in the *Treatise on Taxes and Contributions*, a speculation on "a par of land and labour" or universal standard of value, is to be found, which belongs to this order of ideas. Such instances are, however, the exception.

Petty's speculations are most original in the sphere of trade and commerce. The age was still one of prohibition and restriction, though the absolute prohibitions of the mediæval governments, which regarded trade with a foreign country as a matter of at least very doubtful benefit, were making place for the "mercantile" system, which admitted trade to be desirable, but only in so far as it could be shown to increase the amount of the precious metals in the country, as they were considered to be the only true sources of wealth. Petty saw clearly that the whole system of attempting, with this object, to force trade into artificial channels was a mistake. The sources of wealth, he clearly pointed out, were not gold and silver, but "land and labour," and money he saw was simply a measure of value, owing to certain intrinsic excellences of the precious metals as a standard. "If a man," he pointed out, "can bring to London an ounce of silver out of the earth in Peru in the same time that he can produce a bushel of corn, then one is the natural price of the other. Now if by reason of new and more easy mines a man can get two ounces of silver as formerly he did one, then corn will be as cheap at ten shillings the bushel as it was before at five shillings *ceteris paribus*" (*Treatise on Taxes*, ch. v. p. 38).

These views brought him very near to a correct theory of trade. "Why," he asked, "should we persuade water to rise of itself above its natural spring? . . . We must consider in general that, as wise physicians tamper not exceedingly with their patients, rather complying with the motions of nature than contradicting it with vehement administrations of their own, so in politics and economics the same must be used. . . . Why should we forbid the use of any foreign commodity which our own hands and country cannot produce, when we can employ our spare hands and lands upon such exportable commodities as will purchase the same and more?" (*Treatise on Taxes*, ch. vi. p. 48; *Political Anatomy*, ch. xi. p. 356). Successful trade, and the wealth which trade produces, he saw was a matter of exchange; and that by increasing the amount of both the imports and the exports of the country, the wealth of the country could be increased, and not by trying artificially either to foster the one or the other, or to increase the import of the precious metals (*Treatise on Taxes*, ch. vi.).

He was not, however, always entirely consistent in his views (*Life of Petty*, p. 199). He seems to have believed that there might after all be some inherent superiority in the precious metals over other sources of wealth; and his silence on the Navigation acts is remarkable, especially considering how violently he had opposed them as a member of the parliament of Ireland in their application to the trade of that country (*Political Arithmetick*, ch. i. p. 224; *Life of Petty*, pp. 141-205).

This silence may perhaps be put down to fear of the established powers of the state, whom he was probably afraid of offending by a too open expression of his views. A passage in DAVENANT's works supports this explanation (*Works*, i. p. 129), which also probably accounts for so many of his writings being anonymous, as it undoubtedly does for the last portion of the *Political Arithmetick* having been kept back till after his death, when it was published by his son, Lord Shelburne (*Life of Petty*, p. 205).

Petty saw clearly that import duties should not be levied on raw materials, as the price was thereby raised to the consumer in a degree altogether beyond the revenue brought in to the state. He also desired to levy the inland revenue as much as possible on articles of which the home producer had a practical monopoly, as on them taxation could most easily be imposed without raising prices excessively (*Treatise on Taxes*, ch. vi. pp. 44-49). Nevertheless he admits "that all things ready and ripe for consumption may be made somewhat dearer than the same things made at home, only trade is not to be destroyed, or seriously hampered" (*ib.* p. 42).

In the *Quantulumcumque concerning Money* he states correctly the reasons which make the precious metals fit to be standards of value. There is an expression of opinion in the *Political Anatomy of Ireland*, ch. x., in favour of a single standard, presumably silver, considering the circumstances of the time. His works also contain a clear statement of the evils arising from confusion of coins and debasing the coinage; and from the laws

against usury. In this connection he correctly states the character of "interest"—which he calls "use money"—and "exchange," which he calls "local interest." The former, he says, is "a reward for forbearing the use of your own money for a term of time agreed upon, whatsoever need yourself may have of it meanwhile." The latter is "a reward given for having your money at such a place where you most need the use of it" (*Quantulumcumque*, Queries 28 and 29). In connection with these questions he advocates a decimal coinage (*Quantulumcumque*, Query 31), the convenience of which he points out. He understood that the quantity of money in a country which is necessary ought to depend on the number of transactions. "Money," he said in the *Verbum Sapienti*, in a happy comparison, "is but the fat of the body politick, whereof too much doth as often hinder its agility as too little makes it sick." It is in this connection that, in the *Quantulumcumque concerning Money*, he hits at the master fallacy of the mercantile system by boldly stating that superfluous coin, like any other superfluous commodity, can with advantage be exported (Queries 23-27). In order to keep the supply of money on a level with the requirements of the country from time to time he advocates the establishment of a sound banking system on the example of the banking system of Holland (*Life of Petty*, 228).

In the treatise on taxes a discussion occurs in the early part of the work on the origin of "rent," which he considers mysterious, but though he comes near to stating correctly the origin of rent, it cannot be claimed for him that he anticipated Ricardo, for he regarded rent simply as the profit of the capital invested in the land, though he saw that some lands more favourably situated than others, such as that near towns, would command a higher profit, though he does not state clearly why (*Treatise on Taxes*, ch. v.).

He was strongly impressed with the desirability of increasing the population. An increase of the people he considered was the surest sign of advancing prosperity; but he recognised—and here we see the influence of his knowledge of Ireland—that for an increase to be beneficial, it must be accompanied with a corresponding increase in the efficiency of labour. In connection with his study of the question, he made a remarkable forecast of the growth of the city of London westward (*Treatise on Taxes*, iv. 28). He had fully realised the importance of the division of labour in augmenting production. Cloth, he says, must be made cheaper when one cards, another spins, another weaves, another draws, another dresses, another presses and packs, than when all the operations above mentioned are clumsily performed by the same hand (*Political Arithmetick*, i. 224). He understood that price was founded on supply and demand, and he illustrates this by some observations on the causes of the value of diamonds at different times and in different places (Sloane MS. 2903, British Museum, *Life of Petty*, p. 223).

His economic views largely strengthened his political convictions on certain subjects. He was one of the earliest advocates of a genuine religious

liberty, but he drives home the argument in favour of it by pointing out that maiming, burning, and persecuting people on account of opinion injures the state and diminishes the revenue; and that, as a rule, the *heterodox* are the most thinking, and therefore one of the most productive classes of the community; a proposition which he illustrates by the example of the Dutch (*Political Arithmetick*, ch. i. p. 227; *Life of Petty*, p. 224).

The influence of HOBBS, with whom Petty was brought into contact as a young man when studying in Paris, may be traced in the strong view taken by him of the necessity of a well-organised government, and of increasing the powers of the state; and in his hatred of the notion of any shape of *imperium in imperio*, whether lay or ecclesiastical, which would stand in the way of the legitimate development of the state (*Life of Petty*, pp. 16, 186-188). On the other hand, in his application of the test of utility to most questions, and his clear perception of the vices of the existing electoral system, he is in touch with Locke and the Whigs of the following century.

Petty, owing to several interesting experiments in ship-building connected with the "double-bottom" so often mentioned by Pepys and Evelyn, obtained the good-will of the Duke of York, and unfortunately reciprocated his confidence. Probably owing to his dislike of the extreme Protestants and Exclusion party, whom he regarded as the successors of the republicans who, in 1658, had upset the protectorate on the death of Cromwell, he was induced to trust to the assurances of the duke, when he had become king as James II., that he wished, as Charles II. had wished, to grant a general religious toleration, and would maintain the Irish settlement, in which Petty was largely interested. When, therefore, the Roman Catholic movement in Ireland—which, to say the least, was connived at by the king—showed unmistakable signs of entirely sweeping away the Protestant landowners, the disaster came as a moral as well as a material blow. He died of a gangrene in the foot on the 16th of December 1687, and was buried in the Abbey Church at Romsey.

Petty was an able mathematician, and applied his knowledge to practical ship-building. He was one of the original members of the Royal Society, and towards the end of the reign of Charles II. was appointed a Commissioner of the navy and Judge of the court of Admiralty in Ireland. He sat in the parliament of Charles II. as member for West Looe, and afterwards in the restored parliament of Ireland as member for Inistogue.

A careful study on Petty by the German economist ROSCHER appeared in 1857 in the *Transactions of the Royal Scientific Society of Saxony* (Leipzig); and a dissertation on his works was recently presented to the Faculty of Political Science of the University of Munich by Mr. W. L. BEVAN (Canterbury, 1893). The question of the authorship of the *Observations on the Dublin Bills of Mortality* is fully discussed in *Graunt or Petty*, Boston, 1896, by Professor C. H. HULL, who is preparing a complete edition of Petty's works for the Cambridge University Press. A full biography has been published by Lord Fitzmaurice (John Murray, 1895),

with extracts from Petty's correspondence. The references to the works in the notice are from a volume published at Dublin, in 1769, by Boulter Grierson, under the title of *Tracts chiefly relating to Ireland*.

E. F.

PFEIFFER, J. F. von (1718-1787), a German cameralist of the 18th century, born in Berlin, was the son of a Swiss inhabitant of that town, took part as a young officer in the first campaign of Frederick the Great, and afterwards entered the king's service as an official. Falsely accused of fraud, and pronounced innocent, he left the Prussian state service, and was for many years employed by other princes of the empire. After several more important economic journeys, he returned to Hanau, that he might devote himself to literary work.

Between 1770 and 1778 his principal work appeared, *Lehrbegriff sämtlicher ökonomischer und Cameralwissenschaften*, 4 vols. In quick succession there followed—*Grundriss der wahren und falschen Staatskunst*, 2 vols., 1778.—*Natürliche aus dem Endzweck der Gesellschaft entstehende allgemeine Polizeiwissenschaft*, 2 vols., 1779.—*Antiphysiocrat*, 1780.—*Grundriss der Finanzwissenschaft*, 1781.—*Berichtigungen berühmter Staats- und ökonomischen Schriften dieses Jahrhunderts*, 6 vols., 1781-84. In 1782, though a Protestant, he received an appointment in the Roman Catholic university of Mainz. Four years after his death there (1787) J. N. MOSER published from materials he had left the *Grundsätze und Regeln der Staatswirthschaft*, 1791.

Inama Sternegg describes Pfeiffer as "one of the most important and perhaps the most characteristic representative of CAMERALISTIC SCIENCE" (*q.v.*). His peculiar position in the history of economics is due to his fierce opposition to the physiocratic system (see GERMAN SCHOOL OF POLITICAL ECONOMY; PHYSIOCRATS). This feeling permeates all his writings, appearing chiefly in his *Polizeiwissenschaft*, the *Antiphysiocrat*, and in the *Finanzwissenschaft*. In this the dogmas of the mercantilists are contrasted with those of the physiocrats.

Pfeiffer, whose knowledge of the physiocratic system was exclusively derived from the writings of SCHLETTWEIN, reproached the physiocrats with two errors: (1) that their system advocated an extreme cosmopolitanism, and (2) that it recommended one universal method for all conditions and climates, regardless of the peculiar features and the gradual historical development of the countries concerned. Social economy must be regulated not according to the natural condition but according to the aims of the state. The absolute freedom of nature might suit the savage state—in city-life it is a phantom. Nations ought in economic matters to be as carefully provided with a ruler as a ship is with an experienced helmsman. Trade needs, not uncontrolled, but rational freedom. Finance and administration should be associated to "the great advantage of the state." Pfeiffer compares the statesman with the agriculturist who ploughs the field, manures, and sows, while the financier concerns himself with the harvest,

and supplies the necessary resources. Far from having an exclusive fiscal aim, the taxation which supplies the income of the state should be almost a secondary object to the financier. "Manufactures and trade determine themselves what course they will follow." Therefore only moderate duties should be imposed on the raw materials for home manufactures, and as far as possible they should be untaxed. The "pole star" of state policy, the object which the statesman should ever keep in view, is the rendering of home-production independent of foreign countries. The dogma of the physiocrats, that money in itself is not the true wealth of a country, is correct. Money is not actual, but only "potential wealth." ARISTOTLE (*q.v.*) rightly made merry at those who mistook thus the possession of wealth for riches. The fate of Spain and Portugal in modern times clearly shows that a country may have too much of the precious metals. This hinders the true sources of wealth, for, by a superfluity of gold tokens, wages are raised relatively to other countries, influencing thus home production unfavourably. The balance of trade could be arranged without the precious metals, for instance, by paper representatives of value. On this subject Pfeiffer had said in his *Lehrbegriff*, "money, or coined gold, silver, and copper, is not really wealth, but only an accepted token of wealth and an arbitrarily selected means for arranging an easy mode of buying and selling necessities," *Population and Fertile Soil alone are true and Permanent Possessions* (vol. ii. pt. ii. 111). The "art of making gold" is of use so far only as it promotes the "great art of providing bread for the people" (*Grundriss*, preface).

In the last of his important works:—*Berichtigungen berühmter Staats- und ökonomischer Schriften*, Pfeiffer comments in detail on the works of the following writers:—SEKENDORFF; JUSTI; BIELFELD; SONNENFELS; SCHLETTWEIN; GENOVESI; VERRI; Victor de MIRABEAU; LETROSNE; NECKER; James STEUART, and Adam SMITH. He approved generally Smith's criticism of the physiocrats, yet considered that he failed to appreciate the taxation system of that school.

[G. A. Will, *Versuch über die Physiokraten, deren Geschichte, Litteratur, Inhalt und Werth*, 1782.—Inama Sternegg, Article "J. F. von Pfeiffer" in the *Allgemeine deutschen Biographie*.—Wilhelm Roscher, *Geschichte der National-ökonomik in Deutschland*, 1874.] A. O.

PFENNIG (German). A small copper coin of the nominal value of one hundredth part of a German MARK (*q.v.*). F. E. A.

PHILIPS, ERASMUS (d. 1743), was author of *The State of the Nation in respect to her Commerce, Debts, and Money*, London, 1725, 8vo, 2nd ed., 1726, a work highly praised by McCulloch, *Literature of Political Economy*, p. 351, as anticipating A. Smith and Ricardo. "A trading nation," Phillips writes, "should be an open warehouse, where the merchant may either buy what he pleases or sell what he can." In an *Appeal to Common Sense*, however, 2nd part, London, 1721, 8vo, he had declared himself in favour of bounties on certain exports, and of severe restrictions on the importation

of foreign wrought silks, etc. The *State of the Nation, etc.*, was republished in 1751, in a volume of *Miscellaneous Works* which included a series of essays called the *Country Gentleman* which imitated the *Spectator*, *longo intervallo*.

H. E. E.

PHILLIPS, WILLARD (1784-1873), a lawyer by profession, born in Massachusetts, was a frequent contributor to the *North American Review* in its early days, and author of *Manual of Political Economy*, 1828, and *Propositions concerning Protection and Free Trade*, 1850. The manual is an exposition of English and academic theory then current. Further experience, however, changed the author's convictions and the latter work, a systematic defence of protection in the form of seventy propositions, is of value as illustrating the intellectual exposition of protectionism at that time in the United States.

D. R. D.

PHYSIOCRATIE. See PHYSIOCRATS.

PHYSIOCRATS, THE. The physiocrats were known in their own time as the *ÉCONOMISTES* (q.v.). It was one of them, DU PONT DE NEMOURS, who, in 1799 (*Introduction au Dictionnaire de géographie commerciale*), at a date when the school had hardly any original members surviving, first employed the word "physiocrats," the name by which they are still known. It was taken from the title of a collection of the works of Quesnay, published by Du Pont himself in 1767: *Physiocratie ou Constitution naturelle du Gouvernement le plus avantageux au genre humain*, with this motto—

Ex naturâ jus ordo et leges,  
Ex homine arbitrium regimen et coercitio.

It is clear that *La Physiocratie* was, in the opinion of its authors, a system of government based, not on the despotism of man, on regulation and constraint, but on nature (*phôsis*), whence justice, order, and true law proceed.

Du Pont de Nemours confined the title *physiocrat* to Quesnay and his recognised disciples. It has also sometimes been applied to GOURNAY and his followers. Both the one and the other, in fact, contributed to the establishment of physiocratic doctrine, which, far from emanating fully formed from the mind of Quesnay alone, was not brought out completely in any single work, either of the master or of his pupils, but was given to the public little by little, in fragments, in pamphlets, in books, and above all, in magazine articles—continually undergoing successive modifications. To judge it fairly it is necessary to take it at the time when it had received all the improvements of which it was capable, that is to say about 1772, rather than at the time of its introduction into the world.

Gournay had been appointed *Intendant* of commerce in 1751; Quesnay became at the same time physician to the king, and opened his *entresol* to the philosophers. This date

fixes nearly the origin of the formation of the doctrine. Its first elements were published by Quesnay in the *Encyclopédie*. They were then developed by all the members of the school, especially between 1763 and 1772, principally in the *Journal de l'agriculture, du commerce, et des finances*, and in the *Ephémérides du citoyen* (see EPHEMÉRIDES).

The death of Quesnay and the reaction which followed the ministry of TURGOT, mark, on the other hand, the downfall of the school. Its members were scattered and no longer acted together. But during nearly a quarter of a century the physiocrats played a considerable part in France. Many distinguished men accepted their system without belonging to their school, or to their sect as it was called. During the whole of the reign of Louis XVI. the chief object of the changes in the ministry was the realisation or the delaying of the reforms which they had claimed, and, in 1789, the *Assemblée Constituante* showed itself thoroughly imbued by their doctrines, particularly as to questions of taxation.

After 1768, however, it became the fashion to sneer at them. They had opposed many private interests through combating many prejudices, monopolies, and privileges, and through advancing on several questions propositions absolutely contrary to prevailing ideas. Writers like VOLTAIRE, in *L'Homme aux quarante écus*, and GALIANI in *Dialogues sur le commerce des blés*, had ridiculed them. Their emphatic language, the praises which they mutually distributed, the defective portions of their system, were remembered rather than the discoveries which they had made, the great importance of which it was not the fashion to admit. It was recognised that most of them were worthy men, anxious for the public welfare, but their system was not taken seriously. This expression of disdain reappears in A. SMITH and J. B. SAY. "It would not, surely, be worth while," said the former, "to examine at great length the errors of a system which never has done, and probably never will do, any harm in any part of the world" (*Wealth of Nations*, bk. iv. ch. ix.). "By their rigid spirit, by their dogmatic and abstract language, by their tone of inspiration," said the second, "they give the impression that all those who have investigated economic questions are only dreamers" (*Traité d'économie politique*, Discours préliminaire).

Yet later on, in the same chapter of the *Wealth of Nations* in which the quotation given above occurs, Adam Smith speaks with warmth of the doctrines of the physiocrats. "This system, however, with all its imperfections, is perhaps the nearest approximation to the truth that has yet been published upon the subject of political economy." At the present time full justice is done to the physio-

crats, and they are generally regarded as the real founders of SOCIAL SCIENCE (*q.v.*).

The physiocrats were in fact the first who employed scientific method in directing the movement, which took place in the middle of the 18th century, of research into social phenomena—a movement comparable to that which, a little later on, led to the development of chemistry as a science.

The encyclopædists discussed the functions of government both from the political and the religious point of view. But most of them accepted witty or declamatory phrases as arguments, and abstractions as realities.

Thus ROUSSEAU, whose system also had a widespread but disastrous influence, based the origin of society on agreement among men and the social contract, and could find the source of law only in the caprice of the legislator, and railed against individual property, and inequality among men.

The method of the physiocrats was entirely different. MONTESQUIEU had asserted, in 1749, without carrying his discovery to its farthest limit, that everything in the world was governed by law—that man was governed by his laws, just as matter was governed by its laws. Gournay was drawn on by his own observations to recognise that commerce has its laws “the same over the whole of the universe,” and demonstrated the advantages of freedom of labour. Quesnay went far farther, and sought to determine the laws of the principal social phenomena.

The MERCANTILE SYSTEM, the theory of which D. HUME had commenced to attack in England, was still unanimously accepted in France. There industry was in bonds, fettered by corporations of trades (*see* CORPORATIONS OF ARTS AND TRADES; GILDS; JURANDE), hindered by regulations which fixed minutely the method of manufacture; the provinces were separated from each other by INTERNAL CUSTOMS AND TOLLS (*q.v.*); commerce was hampered at the frontier by duties on imports and exports, and by prohibitions; trade in corn was subject to strict supervision; the exportation of cereals was forbidden; the peasant was overwhelmed by unequal and arbitrary taxation.

The lawfulness of lending money at interest was not recognised. Property was only regarded as a gift of the monarch; in law, and often in fact, the monarch was absolute master both of person and property. He interfered with everything, and under the pretext of protection created and supported a mass of privileges.

The physiocrats had to combat simultaneously the ideas then generally in vogue and official routine. The physical world is subject, said they, to laws which secure the equilibrium of the universe; humanity also has its laws, which ought to insure social order, and social order is only a part of universal order. If men knew these laws accurately and conformed to them, their mutual relations would regulate themselves according to justice, “that universal and sovereign rule, recognised by the light of reason, which determines incontestably what belongs to one's self and what belongs to others” (Quesnay).

The knowledge of these laws, they said further, should form a science entirely new and absolutely

distinct from existing legislation, which, as shown by the contradictory and absurd laws successively enacted among nations, is only the eclectic work of the legislator.

This being so, the physiocrats demonstrated that societies are not formed by chance; that they spring from the nature of man; that far from destroying our liberty, they have allowed us to make use of it, since we cannot live and secure the continuance of our race without the help of our fellow-creatures. Our liberty and our power of action are, without question, relative; they find limits within ourselves, and limits outside ourselves. (*see* RELATIVITY). To suppose that we all have a right to everything, as HOBBS imagined, is as fallacious as to admit that “the swallows have a right to all the gnats that hover in the air” (Quesnay). Our rights spring from our necessities, but are limited by the rights of others. The desire for association draws us together; personal interest impels us on—these are the two forces which, apparently antagonistic, induce harmonious action; they produce order from which societies cannot deviate “without being less societies, without rendering their condition less stable” (Du Pont).

The theory of natural laws was thus set in opposition to the idea upheld by Rousseau, of the all-powerful legislator according to Lycurgus and Plutarch. This is the most interesting part of the work of the physiocrats. The language they employed had not, however, the necessary precision. Quesnay said that natural laws should procure a man whatever he needed without defining clearly what this meant. He and his disciples, identifying the effect of purely physical law with that of natural social law, maintained that every action contrary to these laws, being destructive of order, would draw down inevitable suffering on the culprit. They did not perceive that in social phenomena, actions produce repercussion which recoils on others than their authors. Besides, instead of being content with speaking of natural laws, they employed the inadequate expression of natural right, claiming that every man who comes into this world has a natural right, varying according to circumstances and ability, the right of the individual to do what is to his advantage—whence it would have been easy to deduce the right to live and the right to work, a phrase so much abused by the socialists.

Finally, they laid down the principle that every right involves a correlative and reciprocal duty, “No rights without duties, and no duties without rights” (LE MERCIER DE LA RIVIÈRE). Thus they confused the merely relative relations which constitute law with moral obligations.

But these faults only slightly impair the high value of their researches. The assertion of the existence of social order is in reality the recognition of the law of SOLIDARITY—the term is not met with in the works of the physiocrats, but the statement that man, whose needs seem special and individual, can satisfy none of them without the help of his fellow-creatures, is constantly to be found, as also that the labour of each,—that the modifications and movements (*see* J. S. MILL) of matter—are of advantage to all, that individual utility creates general utility by the co-operation

of all, and that the latter in its turn secures the maintenance of the former. The physiocrats were optimists, they had absolute confidence in continuity of progress. The formula "LAISSEZ FAIRE, LAISSEZ PASSER, adopted by Gournay," is one manifestation of optimism. The avowal of Quesnay and his disciples that the natural laws lead to the advantage of man is another. It was in studying the question of population that they displayed their optimism most clearly. The Marquis de MIRABEAU had said that means of subsistence are the limit of population,—that if the increase of a race depended on its fecundity, there would be no limit to its multiplication,—that the strength of a state is bounded by its population. Quesnay had made his disciple perceive that the movements of population do not necessarily follow those of the means of subsistence, and that a country is not rich if the inhabitants are not comfortable, that is to say, if the population increases more rapidly than the means of subsistence.

After him, Du Pont remarked that in the North American colonies, the population doubled itself every twenty-five years, because the amount of consumable products increases there every day, and he added, "the further one advances in the study of the order of things, there the more one is compelled to admire the reciprocal relations which unite the different portions of this immense community. Nothing stands alone there; everything holds together. Every cause is an effect, every effect is a cause. From wealth springs culture; culture increases wealth; this growth of wealth increases population; the increase of population keeps up the value of wealth itself" (1771). Again the physiocrats said that man daily makes new inventions which allow the poorest peasant in Europe to be better clothed, better lodged, and better fed than the savage; they thus refuted the supposed benefits of the "state of nature" described by J. J. Rousseau and other rhetoricians.

Thus it is through the power of individual interest, and of competition arising from it, that the physiocrats explained the continuity of progress. Gournay, in his correspondence, had often described the moral effect of competition. The disciples of Quesnay said in their turn: "Individual interest is the primary bond of society, which will be the more solid in proportion as private interest is secure. The struggle between private interests is only dangerous if accompanied by violence, whether the law permits or facilitates it, or finds its repression impossible. Governments have no right to destroy order by making war; their only duty, at home, is to repress encroachments on persons and property. Authority is not established to impose laws, they all emanate from the hand of Him who created rights and duties; positive laws ought only to be declaratory of the essential laws of social order. If the ordinances of sovereigns were opposed to the laws of nature, they would be unreasonable, and binding on no one. Authority should only employ the force of the community to compel madmen and depraved men to make their conduct conform to the principles of justice."

The duties of government being thus reduced to the protection of person and property, the maxim according to which general interest ought to out-

weigh individual interest should be rejected as being profitable only to monopolists and to privileged persons who wish to pass off "their special individual interests" as the general interest. The physiocrats therefore demanded the abolition of every privilege connected with classes, individuals, societies, provinces, and towns, with industry and with trade. These privileges were numerous in France—"They are of every class, of every form, and of every colour," said LETROSNE—and he drew up a long list of them.

If, the physiocrats further explained, man has a right to do whatever is to his advantage, he has the right to employ himself to his own best interest, on the sole condition that he does no injury to the person and property of others. As a free being, master of his own actions, he should be master of his own work, and of the fruits of his work; he should thus be absolute owner of the soil on which he works and with which his labour is incorporated. The three pivots of society are, property—liberty—security. From this justification of property, borrowed from LOCKE, the physiocrats deduced the right of every one to sell or buy where he pleased, and trade with whom he pleased, the objects he disposed of or needed.

Quesnay may be regarded as the first defender of free trade, the necessity of which he recognised, not only on account of considerations of right, but also for economic considerations; remarking that the greater the competition the more every one strives to economise the cost of his labour for the advantage of all. "To obtain the greatest possible increase of enjoyment with the least expense, or, better still, the least painful labour with the greatest enjoyment," is, said he, "the perfection of economic conduct."

This conclusion might have led the physiocrats very far on in economic discovery, had they not, adopting the opinion of CANTILLON, that land is the sole source of wealth, completely deceived themselves both as to the nature of wealth and the laws of its distribution. Their views on this subject may be summarised thus:—Agriculture holds a dominant place in human industry, because food is more necessary to life than anything else. Besides, agricultural labour is the only labour which increases the wealth of a country. When the expenses of cultivation, of the renewal of the working capital, the profit of the cultivator, and the seed for the following year, are deducted from the raw produce of the ground, the owner still clears an income or *produit net*. Nothing similar exists in any other industry, particularly not in those connected with articles of luxury; the purchasers of manufactured goods repay the sellers the cost of production and the profit of the traders. These goods yield nothing further, their value is approximately equal to the value of the raw materials used by the workmen and traders either for carrying on the business or for their own support—this does not yield a *produit net*. Manufactures then do not increase wealth; they exist only through the wealth of those who pay for them; that is to say, through the existence of a *produit net* arising from agriculture. Hence the inhabitants of a country may be divided into

three classes:—proprietors, who hold the *produit net*; cultivators who assist its formation; other citizens, like officials, traders, and manufacturers, who do not produce self-renewing wealth, and therefore form a "sterile class." On the ground that the proprietors of the soil hold through the *produit net* all the available revenue of the nation, Quesnay concluded that the state should claim from them, and them only, the sums necessary for the support of the government and the maintenance of public order. Every other form of taxation was, in his opinion, faulty. When a tax is charged on the consumer, his disciples repeated, the conditions of exchange are altered, and restraint is put on the liberty of every one, taxpayers are caused to include in the selling price of their products which are subject to taxation not merely the tax but the amount of their losses, of the restrictions, of the inconveniences which they have undergone. Finally as these products are bought almost entirely by the cultivators or by the landowners, the *produit net* is diminished by the sums added to the tax. Taxation diverts a number of workers from productive labour: this, again, diminishes production, and, in consequence, the *produit net*. The conclusion is that there was only one rational tax; the tax on land direct, single. "Indirect taxation, poor peasants; poor peasants, poor kingdom; poor kingdom, poor monarch," said Quesnay.

By naming the last class of the three "sterile," the physiocrats aroused the indignation of the manufacturers and traders. However, they did not intend by any means to maintain, as they have often been made to say, that manufacturers were useless. They held that this class did not help to make up the gross income which a nation needs to provide for its ever-growing necessities. In the *Tableau Économique*, Quesnay explained this. According to him the cultivators deduct yearly from the gross product of cultivation a first charge—what is necessary for their own support and that of their labourers, and for the reproduction of the crops. The landlords receive the *produit net*; they buy from the cultivators the provisions they need, giving them back thus part of the *produit net* which enables them to buy articles from the "sterile class"; the landlords on their part employ another portion of the *produit net* in purchases of the same kind. By the aid of the portions of the revenue which are thus made over to it, the "sterile class" is enabled to support itself and to work up raw material; they manufacture from this useful goods, by giving new forms to natural productions, but they do not create new wealth. "I give a length of cloth to a tailor; he will never be able to increase it so as to make out of it a coat for himself as well as for me" (Marquis de Mirabeau).

It is here that the great error of the physiocrats lies. By regarding the products drawn directly from the soil as the only wealth, they set themselves in opposition to their own justification of property. They admitted, however, that man can only avail himself of the fertility of the soil by employing labour and capital; that the "advances sunk in the land," whether for clearing the ground, for buildings, improvements as well as

the "original advances" of seeds, implements, and food for man and beast—are necessary in order to make the land profitable; that, further, "annual advances" must be carried over from one harvest to another to perpetuate the pay of the workers, and to keep up the "advances made on the land." But, according to the hypothesis of the *produit net*, it was illogical to base property on labour alone, whether present or accumulated, and Turgot was more consistent when he said that the soil returned something as a pure gift beyond what was due to the labour of man. In the same way, by maintaining that the tax on the land is the only rational tax, they urged on the absorption of all property in the land by the government, because they recognised that the government becomes, through the land-tax, co-proprietor in the property of its subjects. Hence Henry George, the modern opponent of private property in land, dedicated one of his books, *Protection or Free Trade?* "to the memory of those illustrious Frenchmen of a century ago—Quesnay, Turgot, Mirabeau, Condorcet, Du Pont, and their friends, who, in the night of despotism, foresaw the glories of the coming day."

The doctrine of the *produit net* has had, however, some useful results. It attracted capital to agriculture, and helped to improve it in France. It enabled the physiocrats to disprove the system of the BALANCE OF TRADE. If Quesnay was deceived as to the nature of wealth, he saw clearly that it does not consist of money. He held up the example of Spain, exhausted, in spite of the treasures of Peru; of England, wealthy through the development of her commerce and her agriculture. Following his teaching, it is impossible, his disciples said, to create something out of nothing; in an exchange no wealth is formed, but value is given against an equal value; each party profits by the exchange, and without this the exchange would not have been made. To suppose that the balance of trade is the measure of the wealth of a country is absurd, for this balance is often met by goods and not by money, and a nation that has bought more of the precious metals than it needs will be obliged to resell, in order to buy more useful articles.

Finally, the theory of the *produit net* has called attention to the manner in which those taxes were assessed, which, like the DÎME ROYAL, were imposed merely on gross income, without taking cost of production into account, and facilitated the substitution of taxes relating to things for personal taxes. The success that the doctrine obtained was greatly due to this. In France the IMPÔT UNIQUE on land, that is to say, the direct tax on land, was accepted even by those who denied the doctrine of the *produit net*. Abroad, KARL FRIEDRICH, the Margrave of Baden, and Leopold, the Grand Duke of Tuscany, made experiments in it, with more or less successful results.

The analysis of some other economic questions was almost completed by the physiocrats. They carried some way the theory of VALUE, which Morellet clearly distinguished from UTILITY. They laid the foundation of freedom of labour, and, in a host of writings dealing with free trade in corn, examined the greater part of the phenomena of exchange. They insisted, even super-

de la Rivière, *Ordre naturel et essentiel des Sociétés politiques*; *l'Intérêt général de l'Etat*.—Baudéau, *Exposition de la Loi naturelle*; *Première introduction à la philosophie économique*; *Explication du tableau économique*.—Letrotsne, *Utilité des Discussions économiques*; *l'Administration générale et la réforme de l'impôt*; *De l'ordre social*; *De l'intérêt social*.—St. Pérary, *Mémoire sur les effets de l'impôt indirect sur le revenu des propriétaires de biens fonds*.—Abbeille and Montaudouin, *Corps d'observations de la Société d'agriculture de Bretagne*.—Turgot, *Eloge de Gournay and Réflexions sur la formation et la distribution des richesses*.—Herbert, *Essai sur la police générale des grains*.—Morellet, *Prospectus d'un nouveau Dictionnaire du Commerce*.—The Margrave of Baden, *Abrégé des principes*.—Comte Garnier, *Abrégé élémentaire des principes de l'économie politique*, 1796.—Schmalz, *Staatswirthschaftslehre in Briefen an einen deutschen Erprinzen*, 1818, and *Economie politique*, French edition, 1826.—Dutens, *Philosophie de l'économie politique*, 1835. Dutens defended Quesnay's economic teaching in a series of pamphlets:—*Défense de la philosophie de l'économie politique*, 1837.—*Appendice à la défense de la philosophie de l'économie politique*, 1839.—Des prétendues erreurs dans lesquelles, au jugement des modernes économistes, seraient tombés les anciens économistes relativement au principe de la richesse nationale, 1846. These were the latest physiocratic writings. The physiocrats had many adversaries. The following are the most interesting of their works:—Voltaire, *L'Homme aux quarante écus*, 1768, directed against La Rivière; *Diatribes à l'auteur des Ephémérides*, 1775, favourable.—FORBONNAIS, *Principes et observations économiques*, 1767. In the second part of this work, Quesnay's articles "Fermiers" and "Grains" are discussed.—Graslin, *Essai analytique sur la richesse et sur l'impôt*, 1767; and *Correspondance sur un des principes fondamentaux de la doctrine des économistes*, 1779, with Baudéau, on the productivity of manufactures.—MABLY, *Doutes proposés aux philosophes économistes*, 1768.—GALLIANI, *Dialogues sur le commerce des blés*, 1770.—NECKER, *Eloge de Colbert*, 1773, and *De la législation et du commerce des grains*, 1775.—Béardé de l'Abbaye, *Recherches sur les moyens de supprimer les impôts, précédées de l'examen de la nouvelle science*, 1770.—Tissot de la Nove, *Réflexions philosophiques sur l'impôt*, 1775.—LINGUET, *Théorie des Lois civiles*, 1767; *La pierre philosophale, discours économique par le lettré Koung Kia*, 1768; *Réponse aux docteurs modernes, avec la réfutation du système des philosophes économistes*, 1771; *Du Pain et du Blé*, 1774; *Théorie du blé, ou l'art de cultiver avec fruit*, a reply to the *Théorie du paradoxe* (by Morellet), 1775; Linguet also edited the *Journal de politique et de littérature*, 1775-1778; and in conjunction with Mallet du Pan, *Annales politiques civiles et littéraires*, 1777-1791.—Isnard, *Traité des richesses*, 1781.—Pesselier, *Doutes proposés à l'auteur de la théorie de l'impôt*, 1761.—Blonde, *Lettre d'un profane à l'abbé Baudéau*, 1775.—*La Gazette du Commerce* contains articles by Forbonnais and the Abbé Yvon in opposition to the doctrine of the physiocrats. Finally, almost all treatises on political economy, from the *Wealth of Nations* onwards, include a notice of the tenets of the physiocrats. The writings of the opponents of the physiocrats have in their turn provoked many replies to their attacks, which are for the most part published in the *Ephémérides du citoyen*. The physiocrats derived some of their principles from Boisguillebert, *Le Détail de la France sous le règne présent augmenté de plusieurs mémoires et traités sur la même matière*, 1697, and from Cantillon, *Essai sur la nature du commerce en général*, 1755. The doctrine that the earth is the only source of wealth is also found in ASGILL, *Several assertions proved in order to create another species of money than gold*, 1696, and there are many opinions quite in accordance with physiocratic teaching in BANDINI, *Discurso economico*; but this work, written in 1737, was only published in 1775, and has been reproduced in Custodi, *Scrittori classici italiani di economia politica*, parte moderna, vol. i., with a favourable notice of Bandini by Giuseppe Gorani. With regard to the history of the physiocrats, all French histories contain an account of the influence they exercised on their country. The following may be specially noticed:—TOQUEVILLE, *L'ancien régime et la Révolution*, ch. iii.—Taine, *Les origines de la France contemporaine*, vol. i.—Stourm, *Les finances de l'ancien régime et de la révolution*, 1855.—Monteil, *Histoire financière de la France*, with supplement by Ch. Louandre, 1872.—Biollay, *Le pacte de famine*, 1885.—Lacretelle, *Histoire du XVIII<sup>e</sup> siècle*.—Droz, *Histoire du règne de Louis XVI.*—SÉNAC DE MEILHAN, *Le Gouverne-*

ment, les mœurs et les conditions en France avant la Révolution.—La Harpe, *Philosophie du XVIII<sup>e</sup> siècle*. It would be impossible to quote all the "reminiscences" and correspondence of the 18th century relating to the physiocrats. The following only can be mentioned:—*Mémoires* of Madame du Hausset, relating to Quesnay; of Louis Montigny, relating to Mirabeau; of the Baronne d'Oberkirch, relating to La Rivière; of the Comte Beugnot, relating to Du Pont; of Bachaumont; of the Abbé Terray (Coquereau, *Mémoires apocryphes*); of Soulavie, on the reign of Louis XVI.; of MARMONTEL; of Dutens; of Garat (on Suard); of Talleyrand; of Morellet; of Condorcet (LA ROCHEFOUCAULD-LIANCOURT, *Mémoires apocryphes*).—Baron de Gleichen, *Souvenirs*.—The *Correspondances* of Grimm and Diderot; of Métra and of La Harpe.—Pidausot de Moirbert, *L'Observateur Anglois*, containing a chapter devoted to the economists; as in the *Gazette littéraire de l'Europe*.—Galliani, *Lettres*.—*Correspondance de Condorcet et de Turgot*, 1882. A number of works deal specially with the physiocrats, as:—*Du Pont de Nemours*, some of the notes to his edition of the *Œuvres de Turgot*; *Introduction au dictionnaire de géographie commerciale*.—L. de Lavergne, *Economistes français du XVIII<sup>e</sup> siècle*.—DE LOMÉNIE, *Les Mirabeau*, 1888.—*Vincent de Gournay*, "d'après sa correspondance", 1897.—The articles "Les Physiocrates," "Quesnay," "Gournay," "Turgot," "La Rivière," "Forbonnais," etc., in the *Nouveau dictionnaire d'économie politique*.—Oncken, *Introduction to the Œuvres de Quesnay*.—*Appendice à l'histoire de la Physiocratie*, in the *Handwörterbuch der Staatswissenschaften*, 1898.—"Étude sur Louis XVI. et la Physiocratie," in the *Zeitschrift für Literatur und Geschichte der Staatswissenschaften*.—*Die Maxime laissez faire, laissez passer*.—*Der ältere Mirabeau und die ökonomische Gesellschaft in Bern*, 1886.—Joublean, "Notice sur la Rivière," in the *Annales des sciences morales*, 1858.—Batie, *L'homme aux quarante écus et les physiocrates*, 1865.—Reuss, *Charles Butré, physiocrate tourangeau*, 1887.—De Vroil, *Étude sur Cicquot Blevichie*, 1870.—Knies, *Karl Friedrich's von Baden Brieflicher Verkehr mit Mirabeau und Du Pont*, Heidelberg, 1892.—Emminghaus, "Karl Friedrich's von Baden physiocratische Verbindungen, Bestrebungen und Versuche," in the *Jahrbuch für Nationalökonomie*, vol. xix. p. 72.—Erdmannsdorffer, *Politischer Briefwechsel Karl Friedrich's von Baden*, 1888.—Bauer, "Zur Entstehung der Physiocratie," in the *Jahrbuch für Nationalökonomie*, Jena.—Blanqui, *Histoire de l'économie politique en Europe*.—Espinass, *Histoire des Doctrines économiques*, 1891.—Henry Higgs, *The Physiocrats*, London, 1897.] G. S.

PIASTRE, the 100th part of the Turkish pound (gold medjidie), and a similar fraction of the Egyptian pound. Turkish silver coins of 20 piastres (known as silver medjidies) as well as pieces of 10, 5, 2, 1, and  $\frac{1}{2}$  piastres form part of the currency of the Ottoman empire. These coins are all of the fineness of 830. Similar pieces, with the addition of a quarter piastre, are in circulation in Egypt, but as the sterling value of the Egyptian pound is 20s. 3 $\frac{1}{2}$ d., as against 18s. 0 $\frac{1}{2}$ d., the value of the Turkish medjidie, the Egyptian piastres are of a somewhat higher nominal value than those of Turkey. Their millesimal fineness is 833.3.

In 1879 the British government introduced into Cyprus coins known as bronze piastres and half-piastres. This piastre passes current at  $1\frac{1}{2}$  Turkish silver piastres, and is rated in sterling at the 180th part of a pound, or 1 $\frac{1}{2}$ d. (see POUND, EGYPTIAN; MEDJIDIE). F. E. A.

PIE (BRITISH INDIAN), the 192nd part of a rupee. A copper coin weighing 33 $\frac{1}{2}$  grains. F. E. A.

PIEPOWDER COURT, the lowest known to the English law. It was a court of record

incident to every fair and market, and in it were decided cases of commercial injury arising in the fair or market actually being held, not those which happened in the preceding one. The suit was thus limited to the duration of the fair. This practically obsolete court had by stat. 17 Edw. IV., and 1 Ric. III., cognisance of all matters of contract arising within the precinct of the fair or market, and its object was speedy justice according to the *lex mercatoria* between people who, having come from distant places, might not be amenable to any one of the other inferior courts. The steward of the owner of the market tolls was the judge, and an appeal by writ of error was allowed to the courts at Westminster. In the middle ages, when the administration of justice was a direct source of revenue, these courts were an important part of the profit of the owner. At Norwich in 1306 the prior summoned, attached, distrained, and amerced offenders in his fair-court. When the fair was done, he was bound to send his prisoners to the city gaol; but if any were ultimately condemned to lose life or limb, his officers carried out the sentence (Blomefield, *Norfolk*, iii. 72, ed. 1806). The London piepowder court was held at Cloth Fair during the time of Bartholomew fair, and Allen's *History of London*, 1827, gives the proclamation of regulations then in use. This court ceased about 1854, but the Tolsey court in Bristol and a piepowder court at Broughton-in-Furness were apparently held in 1885 (1st Rept. *Market Rights Commission*, vol. ii. p. 55, 1888).

The name is derived from *pié-poudreux*, the old French expression meaning a pedlar, but the Latin form *curia pedis pulverizati*, points to the older but false etymology.

The records of a fair-court in 1275 may be found at p. 138 of Maitland's *Select Pleas in Manorial Courts*, and an interesting 15th-cent. case is printed in Harrod's *Colchester Records*, p. 5. The original records of a piepowder court, 1732 to 1813, are among the MSS. of the corporation of Eye.

R. H.

PIETRO DA ANCARANO (end of 16th century).

An Italian jurist and theologian, entertained liberal views on the lawfulness of *Monti* (municipal loans) and of the transfer of their interest-bearing bonds (*luoghi di Monte*).

E. Ca.

PIGEONNEAU, H. (1834-1892), professor in the *Faculté des Lettres* and the *École des Sciences Politiques* of Paris.

Besides a publication of the reports and proceedings of the Board of Agriculture, annexed to the ministry of finance (*Procès verbaux et rapports de l'administration de l'agriculture au Contrôle Général des Finances*) during the reign of Louis XVI. (Paris, 1882) and several handbooks of geography, Pigeonneau wrote *Histoire du Commerce de la France* (Paris, 2 vols., 1885 and 1888), which won a prize from the French

academy and is the only French work on the subject aiming at completeness. Owing to the untimely death of the author, it does not extend farther than the administration of Cardinal Richelieu. It conveys a very clear and adequate idea of the reactions of the political on the economic life of the nation and *vice versa*; the history of French trade being throughout considered as one of the aspects of the history of French civilisation.

E. Ca.

PIGNUS. Pignus is the equivalent of the English pledge. The contract of pledge was one of the four real contracts of Roman law, and required no formality beyond the delivery of the object. Originally the creditor acquired by this contract merely a right to detain the article pledged until the debt had been satisfied. Subsequently he acquired the right of sale in case of default, and the right of foreclosure if sale proved impossible. He was bound to take strict care of the object pledged, not to make use of it for his own purposes, and either to restore to the owner any fruits or profits which it might yield, or else to deduct their value from the amount of the debt. If the sale yielded a surplus after paying principal and interest, this belonged to the debtor.

[*Institutes of Justinian*, ed. Moyle, bk. iii. pt. 14.]

F. C. M.

PILLAR DOLLAR. See DOLLAR.

PILLET-WILL, COUNT (1781-1860). A Parisian banker, he filled a prominent part on the administrative boards of many important French financial and industrial establishments; he was also one of the founders and managers of the *Caisse d'Épargne*—the savings bank.

He wrote: *Rapport sur les jurandes et maîtrises* (1821); *Examen analytique de l'usine de Decazeville* (1832); *De la dépense et du produit des canaux et des chemins de fer* (1837), and several pamphlets on questions of finance.

E. Ca.

PINKERTON, JOHN (1758-1826), though strictly speaking scarcely an economist, was a miscellaneous writer whose productions are useful to the economist.

He published, among other books, *An Essay on Medals*, or *An Introduction to the Knowledge of Ancient and Modern Coins and Medals, especially those of Greece, Rome, and Britain* (London, 1784, 2 vols. 8vo; 3rd ed., London, 1808, 2 vols., 8vo). The work is referred to by McCulloch (*Lit. of Pol. Econ.*, p. 165) as "one of the most useful publications on the subject."

A. L.

PINTO, ISAAC (1715-1787), born at Amsterdam, died at the Hague. He was descended from a Portuguese family and lived for some time at Bordeaux. He then settled in Holland, where he soon made a large fortune and an equally great reputation. The Statthouder William IV. (1747-51) had a very high opinion of his advice, both on administration and finance. He was as tolerant as he was high-minded, and his benevolence won him popularity.

A Jew himself, he defended his co-religionists against Voltaire. As an economist he wrote two works not without merit, though somewhat paradoxical.

These are *Essai sur le luxe considéré relativement à la population et à l'économie*, 12mo, 1762, in which the author deprecates luxury, understanding by this expression expenditure beyond income, a sense in which it is not employed at the present day, and *Traité de la circulation et du crédit*, 12mo, 1773, and 8vo, 1781, which describes stock exchange transactions. This treatise advocates public debts, which Pinto considers a cause of prosperity to a country. A. C. F.

PIPE. See MEASURES AND WEIGHTS.

PIPE ROLLS. The great or annual rolls of the exchequer (*Rotuli Magni*, *Rotuli Annales*) in which the royal revenue in every shire was accounted for; also known later as Pipe Rolls (*Rotuli Pipe*), being probably so called from the likeness of a pipe (*ductus aquae*) through which the royal treasury was filled (Pipe Roll Soc. Publications, iii. 42).

These rolls, the most ancient of our national records, are preserved in an almost unbroken series from the beginning of the reign of Henry II. to the second year of William IV., though a partial transcript only of the first-year-roll of the former reign is preserved in the Red Book of the exchequer. A still earlier roll for the thirtieth year of Henry I. exists, and is of great historical importance (Ed. Hunter, cp. Madox, *Hist. of Exch. Dissert. Epist.*). Alexander de Swereford, who resided at the exchequer in the first years of the 13th century, mentions several other year-rolls of this reign (Red Book, folios 47 and 186). There are also pipe rolls of the Duchy of Normandy (*Rotuli Normannie*) during the last years of the 12th century (Ed. Stapleton) and a large series of chancellor's rolls (*Rotuli Cancellarii*), being the antigraphs of the pipe rolls, exist from the ninth year of Henry II. to the third year of William IV., but the pipe rolls and chancellor's rolls of the earliest period seem sometimes to have been interchanged in the official lists.

Besides these, a third roll (*Rotulus Tertius*) was kept for a short time in the reign of Henry II. by the famous Magister Thomas Brunus, as a check upon the rolls of the treasurer and chancellor.

In the middle of the 12th century the exchequer was the most ancient and important branch of the *curia*, the only permanent and well-organised department of the state, the seat of the chancery and the receptacle of all judicial records and state papers. The pipe rolls, therefore, though the most important of the exchequer records, were by no means the only ones which then existed. With them were preserved in the iron-bound chest of the treasury of the receipt the great exactory roll (*Rotulus Exactorius*), setting forth all the

fixed farms of the counties, hundreds, and royal manors; the Danegeld roll (*Rotulus Danegeldi*) the rolls of honours, or escheated baronies, tallage rolls of Jews and towns, together with an earlier series of exchequer records which are now represented from the 13th century only—the memoranda, receipt, and issue rolls and ministers' accounts. All of these were subsidiary to the making of the pipe roll of the 12th century, but before the middle of the 14th century the latter had become in turn of secondary importance to the bulky series of schedules (*compoti*) and foreign accounts (*Rotuli Peregrini*), in proportion as the royal revenue came to be drawn from customs and subsidies on merchandise rather than from the profits of the crown lands, from feudal imposts, and from judicial amercements. Moreover the chancery as a distinct department from the beginning of the 13th century relieved the pressure upon the exchequer rolls by the system of estreats which were recorded in the *Originalia* rolls.

The pipe rolls belong to the class of "headed" rolls, that is to say rolls composed of a number of membranes sewn together at one end, instead of end to end, or consecutively, like the rolls of chancery. Possibly each county was at first kept separate in the form of a "parvus rotulus" or "rotulet" as it would now be called. Elaborate directions for the choice of parchment and order of entry are contained in the *Dialogus de Scaccario* (i. 5, 8); but the feature of the pipe roll as a record lies in the fact that it was made up in open court and is a record of the actual proceedings that took place upon the conclusion of the account of every sheriff of England. Nevertheless erasures, interlineations, and other discrepancies occur from a very early period, and in the year 1236 the pipe roll of 7 Henry II. was convicted of error by a jury before the king's barons of the exchequer, and it was jocularly proposed that it should be cast into the Fleet Prison (Red Book, fol. 232).

The great roll, then, was compiled from various rolls which served at the exchequer as daybooks and ledgers, but more especially it was at first intended to comprise three several classes of payments due to the crown—(1) the king's farm, (2) the king's geld, (3) the king's debts, chiefly in respect of judicial proceedings. The above were entered in their proper sequence, the farm of the county being disposed of at the close of the account by a ceremony, the object of which was to display the amount of the farm due which was never stated in the summons to the sheriff. It is a curious fact that the amounts of the farms of the counties are not set out in any surviving record, a circumstance which is due to the loss of the exactory rolls in which they were separately entered.

Attempts have been made to ascertain the

farm by the addition of the sums paid out to those paid in, but without much success, and it will be found that the secret of the system of account lies in the deduction of the blanching money, whether blank or by tale, from every item of the disbursements. When the results thus obtained are compared with a unique fragment of an exactory roll of the reign of Henry III. they are found to agree precisely (*Red Book of Exchequer*, p. 779).

This discovery possesses considerable economic importance since it enables us to ascertain the value of the crown revenues derived from land in the 12th and 13th centuries. From the entries of payments made by the sheriffs on behalf of the crown for victuals and other necessities, it is also possible to collect an extensive list of products of the soil and of articles of merchandise with their prices (Hall, *Court Life under the Plantagenets*, p. 221), whilst their historical and antiquarian value has been clearly shown by Mr. Eyton (*Court and Household of Henry II.*). There is an additional interest attaching to these stately records from the consideration of the influence which they must have exercised over the system of the commercial accounts in general. It seems almost certain that the king's exchequer served as a model for the transaction of business in the merchant's counting house, apparently with beneficial results, down to the end of the 15th century at least, and the influence of the old forms can be traced to a much later date. But long before this date the system of the pipe rolls had become a mere formality, though the pipe office declared accounts were an effective method of account down to the end of the reign of George III. (see EXCHEQUER; FARM OF THE COUNTIES; FARMING TAXES; FERM).

PISTAREEN, HISTORY OF. A Spanish silver coin worth about a FRANC, sometimes spelled pestereen, pistorin, or piastereen, the latter suggesting that the name is "camp" Spanish for "little piastre." Originally struck early in the 18th century, as debased provincial coins for circulation only in Spain as 2 reals of new plate, i.e. new standard of silver (in connection with the rating of the Spanish DOLLAR, or piece-of-eight, at 20 instead of 8 reals), this convenient token rapidly passed to America and the West Indies, where it played a great part in the local currency of the New World during the 18th and part of the 19th century. As a result of certain imperial monetary legislation in 1704, our West Indian colonies were passing, about the date of the appearance of the pistareen, from a silver to a gold currency. Being of base silver, the pistareen, unlike the standard Spanish dollar, was enabled to hold its ground in con-

current circulation with gold, and thus served, like a SHILLING or a franc, for internal and subsidiary circulation under cover of a gold standard. In 1825 in the West Indies, in 1827 in the United States, and in 1830 in Canada, steps were taken to get rid of a coin which was no longer needed, and which tended to be passed as a quarter instead of a fifth of a dollar. Consequently the pistareen, after over a century's use, was driven back to the peninsula. Its modern representative is the Spanish PESETA, equal in weight and fineness to the franc of the LATIN UNION.

[Heiss, *Monedas Hispano-Cristianas*, Madrid, 1865.—Chalmers, *History of Currency in the British Colonies*, London, 1893.] R. C.

PISTOLE. From 1537 to 1772 the gold coins of Spain were the escudo and its multiples; the double escudo or pistole; the double pistole; and the quadruple pistole or onza de oro, also known as the doubloon. The pistole weighed 104.4 grains of gold of the millesimal fineness of 916.6. Its intrinsic value, therefore, in sterling would be 16s. 11½d. (1 oz. = £3:17:10½). Pistoles formed part of the metallic currency of British colonies, in the West Indies, and of Bahamas, Canada, and New Brunswick (see DOUBLOON, HISTORY OF THE). F. E. A.

PITT, WILLIAM (1759-1806), the great statesman, was the earliest English minister to give practical effect to the theories of ADAM SMITH (*q.v.*). During the first years of his administration he laboured at reducing to order the chaos of the customs duties, and established the CONSOLIDATED FUND, though hampered during the greater part of his career by the war on the continent. In finance, he succeeded, during 1784-85—fortunately years of peace—in funding the unfunded debt, and, in the following year set on foot his scheme for reducing the national debt by means of a SINKING FUND (*q.v.*), a scheme which, afterwards, involved the borrowing of money at a high rate of interest to pay off debts contracted at a low rate. A higher title to fame rests on the negotiation of the commercial treaty with France of September 1786 (see below, and COMMERCIAL TREATIES). Pitt had been unsuccessful in his endeavours in 1785 to secure complete reciprocity between England and Ireland, having been thwarted by the jealousies of the English merchants. The merchants, however, were for the most part in favour of the French treaty. Its preamble declares the object desired was to procure the most solid advantages on both sides to the natural productions and industry, and to put an end to the contraband trade. The treaty was to remain in force twelve years. It admitted French wines into England on the same terms as those of Portugal; substituted for existing duties an "ad valorem" 12 per cent duty on cotton and woollen manufactures, and an "ad valorem"

10 per cent duty on hardwares, cutlery, iron, steel, etc., and provided that all goods, not specified, were to come under the condition of the most favoured nation clause. In case of war, subjects of either power were to have the privilege of remaining and trading, so long as they behaved peaceably. Full liberty to travel without license or passport was given to the subjects of either kingdom, as well as perfect liberty in the matter of religion. Unhappily the outbreak of war put back for many years the consummation of Pitt's ideal.

In marked contrast with this enlightened policy was Pitt's action on POOR LAW questions. It is true that he had learnt from A. Smith the necessity of a radical amendment in the law of settlement (see POOR LAW), and that the time for which he legislated was one of distress seldom paralleled in English history. Nevertheless, the results of the measure of 1796 (36 Geo. III. c. 23), which repealed so much of 9 Geo. I. c. 7 as prohibited relief being given to persons who should refuse relief in the Poor Houses set up in accordance with the provisions of that Act, and further empowered overseers, with the approbation of the parishioners, or of any justice and justices, at their discretion, to order relief to any industrious poor person, were disastrous in the extreme. "Henceforth," says Sir G. Nicholl, "outdoor relief, in some form or other, became the rule, and a source of great and universal abuse." Pitt's views on the poor law were embodied in a bill which did not advance beyond the drafting, the provisions of which included the granting of allowances in aid of wages, of advances to persons to enable them to obtain land, keep a cow, or acquire a competence in trade, and of relief to small property holders. Its proposals were mercilessly exposed by BENTHAM in *Observations on the Poor Law introduced by Mr. Pitt*, London, 1798, 8vo, privately printed (see also MALTHUS).

E. E.

"Pitt's object in arranging the treaty was not so much commercial as political. He thought, and rightly thought, a friendly feeling between the two great countries of England and France worth every effort which he could make. He had to meet the fierce invectives of Fox, and the stern opposition of Burke, and had to use every argument in his power to carry his

measure. The commercial policy of the two nations has changed much since that period; for then the commercial policy of France was, in these respects, more liberal than that of England. Pitt's words, that he desired to lay 'a foundation for an amicable intercourse between the two countries,' reveal the motive, the very honourable motive, which was the keystone of his policy in proposing this treaty."

It received high praise from Mr. Gladstone. When introducing his own treaty with France in 1860, he described Pitt as "that greatest of all our peace ministers," and spoke of the treaty as "One of the very best and very wisest measures ever adopted by parliament, and which contributed at least as much as any passage of his brilliant career to the fame of the great statesman who introduced it."

The high duties then in force had encouraged CONTRABAND transactions so much that a large part of the trade between England and France was then in the hands of the smuggler.

"Of this fact, too, Pitt made great use in his speeches in the House of Commons on the subject of the French treaty. 'Although we had laid,' he said, 'in most instances, prohibiting duties, and in some absolute prohibitions on articles of French produce and manufacture, yet it was perfectly notorious that many of those very articles were in constant use and consumption in this kingdom.' As an instance, he mentioned the articles of French cambrics, which, though lying under a prohibition, were yet constantly worn by most persons; and, he believed, without a single exception, by every gentleman in the House. This remark shows how completely the practice of smuggling was recognised at that time, if W. Pitt had no doubt that all those who were listening to him, even in the House of Commons, habitually wore cambric which had been smuggled into the country." [See *Banker's Magazine*, March 1877.]

PLACE, FRANCIS (1771-1854), wrote *Illustrations and proofs of the principle of Population: including an examination of the proposed remedies of Mr. Malthus, and a reply to the objections of Mr. Godwin and others*. London, 1822, 8vo.

In the ten chapters of the book the author treats of the question of population as between Malthus and Godwin; of the respective populations of Sweden, and of the United States; ch. iv. discusses Mr. David Booth's "Dissertation on the Ratios of Increase in Population and in the Means of Subsistence." The author next treats of the population of ancient states; of the means of preventing the numbers of mankind from increasing faster than food is provided, with (vi. § 3) his own ideas on the subject. Place lays great stress on the misery, poverty, and crime which so frequently result from large families; and insists that it should be clearly pointed out to the poor that the market can be overstocked with labour; that this caused the low rate of wages; that misery and poverty follow indiscretion; and that by voluntary restriction of families, the supply of labour might be brought rather under the demand.

The rest of the work treats of the population of England (ch. vii., five secs.), and the decrease of mortality here; of the accumulation of capital as it conduces to the well-being of the people; and concludes by a defence of political economy as against Mr. Godwin's attacks on the science.

**PLANTATION.** The old term by which the British colonies in Virginia, New England, and the West Indies were originally known; it was official as well as popular, and so universal in the earliest records of colonisation that it would be difficult to decide by whom it was first used.

The commission upon trade appointed by James I. in 1622, and renewed by Charles I. in 1625, seems to have been the germ of the Committee and Commissioners of Trade and Plantations (sometimes "Foreign Plantations") which are referred to not infrequently from 1630 onwards, e.g. in 1636 in connection with Virginia, and again in 1637 in a proclamation restraining emigration. Cromwell appointed a standing commission on trade, and Charles II. in 1660 appointed two councils, one for trade, the other for "Foreign Plantations." To the latter was assigned the duty of investigating and recording the trade and general condition of the colonies, of controlling emigration to them, and supervising their social progress. The functions of the two councils overlapped, and they were united in 1672; but the existence of the new council was precarious and sometimes suspended, till, in 1696, William III. definitely constituted the germs of the present BOARD OF TRADE (*q.v.*). Under this the plantations were administered till 1768, when a secretary of state for the colonies was first appointed. His office was popularly known as the "Plantation Office"; and when in 1781 it was abolished, that name was attached to the department of the home office which for the next twenty years administered colonial affairs.

With the close of the 18th century the term had fallen into disuse, and was gradually supplanted by the term "colonies." In the term "plantation duty" it lingered on till the year 1846.

[*Calendars of State Papers, Colonial, passim.*—Macpherson's *Annals of Commerce*, vol. iii.—*Official History of Public Departments*. (See also under COLONIES.)] C. A. H.

**PLANTATION OFFICE.** See PLANTATION.

**PLANTATION DUTIES.** This term denotes the taxes formerly levied by the British government upon its colonies or "foreign plantations" (see PLANTATION). These must not be confounded with the  $4\frac{1}{2}$  per cent duty levied by various West Indian legislatures on their exports (see EXPORTS, DUTIES ON). They were payable into the imperial Exchequer and were first levied in 1672 (act 25 Charles II. c. 7),

on the export of certain produce of the plantations in default of a sufficient bond by the exporter to bring the produce to England or Wales, and were thus avowedly for the purpose of preventing the export of colonial produce to any foreign country. They might be levied in kind if the exporter had no ready money. The produce of the duties was small, and the first appropriation of it by parliament was made in 1699. The average annual amount which they produced during Queen Anne's reign was estimated at £1000. A variation of this idea of taxing the plantations for restrictive purposes was tried in 1733, with some idea (it is hard to say what) of favouring the sugar colonies in the West Indies: by 6 Geo. II. c. 13, duties were levied on all foreign tropical produce imported into the plantations of North America. They did not bring into the exchequer any great sum. The principle so admitted was extended in 1763 by act 4 Geo. III. c. 15, which avowed the justice of raising a revenue in the king's dominions in America for defraying the expenses of their defence and protection. These duties were levied on the importation of sugar, indigo, silks, linens, etc., into the American colonies or plantations, and for the twenty-three years up to 1787 averaged £6000 a year. In 1765, by Grenville's Stamp Act, the British government made their notorious effort to extend the principle of taxing the colonies for imperial purposes by assuming to levy internal taxation. On the failure of this scheme they fell back on the increase of the plantation [customs] duties, and in 1767 appointed a special board to administer them. In 1767 a further extension was attempted: new duties on glass, paper, painters' colours, and tea imported into the plantations were imposed, and the right to apply them for the civil government as well as for defence was asserted. These were called "port duties," and it was the duty on tea which led, in 1775, to the revolt and subsequent loss of the New England colonies. These port duties were repealed in 1778, but the other plantation duties survived, being expressly appropriated by the Consolidated Fund Act of 1787, and further recognised by various acts up to 1846, when they were abolished by the acts 9 & 10 Vict. c. 94.

[House of Commons Return, 366-I., of 1869.]

C. A. H.

**PLATO**, the great Athenian philosopher (427-347 B.C.), does not, like his pupil ARISTOTLE (*q.v.*), reach the conception of a special "science of wealth," but in his treatment of political and ethical questions he takes account of economic conditions, and his political speculations deal to some extent, though not primarily, with economic problems. In his *Republic* (II. 369 B) he says of the state that "it comes into existence because the individual is not self-sufficing but has many

needs." The most urgent of these are food, shelter, and clothing: and so Plato goes on to picture a state or society of the simplest kind as consisting of a husbandman, a builder, a weaver, a shoemaker, and perhaps a few other craftsmen supplying their own and each other's wants. This need not be understood as if Plato thought that states actually arose in every case through different kinds of economic producers coming together and making a "social contract." The conception of the origin of society in a contract was known to him (see *Rep.* II. 359 A); it had doubtless been propounded by some of the Sophists or popular philosophers of the time. But he himself in the *Laws* (III. 676 *seq.*) puts forward very clearly the same theory of the growth of political society out of the patriarchal family, which Aristotle adopts in his *Politics* (I. 2), though, in the difficulty generally felt by the ancients of conceiving a beginning of civilisation, the patriarchal families out of which our societies are said to have been developed are supposed to be the survivors of some earlier city-states destroyed by a deluge. What Plato says in *Rep.* II. may fairly be interpreted as a recognition of the economic basis of all political society. He sees the significance of the division of labour, arguing that it is expedient that each worker should produce that commodity which he can produce best in excess of his own requirements, and exchange this commodity for the products of others, rather than that every one should distribute his time among various pursuits so as to supply all his own needs (369 E, 370 A). It is to be noted, however, that this division of labour is not based by Plato solely on the economic advantage in respect of the quality and quantity of production, but also on the supposed natural differences of individuals. "All things are produced in greater abundance and better in quality and more easily, when one man does one thing which is natural to him and does it at the right time and leaves other things alone" (370 c, cp. *Laws*, VIII. 846 E). Besides the producers of commodities directly used for the support of life, there must be producers of the instruments those workers require. And for the exchange of commodities with other states there must be merchants (*ἐμποροί*, 371 A), and for exchange within the state—Plato thinks only of a small city-state—we must have retail dealers (*κάπηλοι*, 371 D), who ought to be persons physically unfit for other kinds of labour. From the skilled producers, whom he thinks of as independent workers, Plato distinguishes as a separate class the unskilled labourers for hire.

The consideration of foreign commerce leads Plato to remark that "what they produce at home must be not only enough for themselves, but such both in quantity and quality as to

accommodate those from whom their wants are supplied" (371 A). In this we may see an implicit recognition that imports and exports must balance one another. But Plato has no "mercantile theory" to lead him astray, nor to suggest the full significance of the problems of foreign trade. In the *Laws* (IV. 705 A, B) Plato expresses the opinion, like Aristotle after him (*Pol.* VII. c. 5 and 6), that a state should as far as possible be self-sufficing and not dependent on foreign imports; but he prohibits duties on imports and exports (*Laws*, VIII. 847 B). The mention of exchange in *Rep.* II. suggests the purpose of money (*νόμισμα*): "From the practice of buying and selling will arise money as a token, or conventional sign, for the sake of exchange" (*ἐμβόλον τῆς ἀλλαγῆς ἕνεκα*, 371 B).

When Socrates in Plato's dialogue has described the simple sort of life which will be led in this "political society on its lowest terms" (*ἡ ἀναγκαϊοτάτη πόλις*, *Rep.* 369 D), the description is scoffed at by Glaucon, one of the speakers in the dialogue, as that of a "city of pigs" (372 D). In this passage there is almost certainly an allusion to the cynic ideal of the "return to nature" and the simplification of life—a Hellenic anticipation of Rousseauism. To meet the demand of Glaucon for a more elaborate ideal, Socrates proceeds to consider a state on a larger scale. But in the discussions to which this leads, on war, education, art, religion, etc., there is nothing of specially economic interest, except the rigid division into classes which is held to be the logical consequence of the principle of division of labour, "one man, one trade." In a well-regulated state, rulers, warriors, husbandmen, artisans should each form separate classes or castes, though individuals may occasionally have to be transferred from one caste to another, when they show higher or lower capacities than those of the caste in which they are born (*Rep.* III. 412-415). Slavery would not be necessary in Plato's ideal state, where the needs of life are met by the labour of subject classes of citizens; but he seems to take for granted that there will be slaves even in his ideal state, though he objects to the enslavement of Greek by Greek (V. 469 B). The community of goods, which, along with the abolition of the private family and the admission of women to the same occupations as men, Plato holds to be necessary in the most perfect state (*Rep.* III. 416 D-417 B; IV. 423 E, 424 A; V. 449-466), is not proposed as a solution of economic difficulties. In fact Plato, as Aristotle rightly complains in *Pol.* II. 5, § 18, never discusses whether communism is to be applied to the labouring classes or not. Plato advocates communism on ethical and not on economic grounds. The philosopher-rulers of the ideal state should have no private in-

terests of property or of family to divert them from their public duties. They are to live like soldiers in barracks with common meals, etc., such as there were at Sparta. Thus if we seek for later parallels to Plato's ideal state, we should find them, not so much in any of the modern communistic or socialistic ideals—though Plato's *Republic* is directly or indirectly the parent of most of them—as in the communism of monastic orders or in the rule of the Jesuit missionaries in Paraguay (see Kaufmann, *Socialism and Communism in their Practical Application*, S.P.C.K., 1883), which, if we substitute priests for philosophers, forms the most remarkable realisation of Plato's ideal state that the world has ever seen. The state in which wealth, instead of philosophic virtue, provides the ruling principle is oligarchy—one of the corrupt forms of government. In his account of oligarchy, in *Rep.* VIII., Plato seems to be thinking mainly of commercial states such as Corinth. In such states there comes to be one city of the rich and one of the poor, and the evils of debt prepare the way for revolution and for "the tyrant" who begins by posing as "the people's friend."

In the *Laws*, which Plato wrote later than the *Republic*, and probably in his old age, he still speaks of communism of property as essential to the best state; but he is now content to work out the plan of a "second-best state" in which, giving up community of goods as too high an ideal for average human nature, he proposes equality of property in land (*V.* 739, 740). Citizenship is to be limited to those owning land and engaged in agriculture. The number of citizens, i.e. of heads of households—for the private family is retained in the second-best state—and owners of allotments, is fixed at 5040, a number convenient for subdivision (737 E, 738 A). None of the citizens is to be an artisan or to engage in trade, whether as merchant or retail dealer (*VIII.* 846 D; *XI.* 919 D). The lots of land are to be equal in value at the foundation of the state, inferior quality being compensated by larger size (*V.* 745 C), and the original equality is to be maintained as far as possible through regulation of the population under the advice and direction of the elder citizens. If need be, an excess of population is to be relieved by colonisation (740 D, E); a deficiency, but only in case of absolute necessity, is to be met by the admission of new citizens (741 A). Gold and silver coin are not to be owned by private persons, who are to employ a coinage current only within the state, though for the needs of intercourse with foreign countries the state must use a currency that will be accepted elsewhere (742 A). With respect to property other than land, absolute equality is regarded as unattainable. The citizens are to be divided into four classes according to their possessions,

the lowest class consisting of those who have only the original lot of land; but no one is to be allowed to acquire more than four times this amount of property. Anything beyond this limit of wealth is to go to the state and "the gods of the state" (744 B-745 A). A proposal that every citizen's allotment of land should be in two sections, one nearer the city and one farther away, is adopted from quite other than economic reasons; it is a method of equalising the value of the property (745 C). This proposal is objected to by Aristotle in *Pol.* II. 6, § 15, as inconvenient; but, like very many other things in Plato's *Laws*, it is adopted by Aristotle himself in his ideal state for the same reason of equality, and in order that there may be unanimity among the citizens in case of war and threatened invasion (*Pol.* VII. 10, § 11). Though Plato prohibits the taking of interest on loans (*Laws*, XI. 921 D), and even refuses to enforce by law the repayment of borrowed capital (*V.* 742 C), he allows interest to be charged on overdue accounts (921 D).

Economic matters are hardly referred to in any other of Plato's dialogues. In the *Sophist* (219 A-C) a distinction is drawn between those arts which are productive or creative (*τεχναι ποιητικαί*) and those which are acquisitive (*κτητικαί*); but the subdivisions of the latter class are fanciful rather than scientific. The dichotomies of this dialogue are an ironical method of describing the nature of the sophist, and not a serious attempt at a classification of the arts. The classification of the different forms of property in the *Statesman* (*Politicus*, 287-289) are somewhat less artificial and, along with the passage in *Rep.* II. 369 B-371 E already referred to, may be regarded as preparing the way for the treatment of economics in Aristotle's *Pol.* I. 8-11.

The subject of wealth is throughout treated by Plato from the ethical point of view. He distinguishes in the scale of good things three grades: (1) the goods of the soul, i.e. wisdom, self-control, and the other virtues; (2) health, the good of the body; (3) wealth. The lower only exists for the sake of the higher good, and pursuit of it is always to be limited and determined by consideration for the higher. (*Laws*, V. 743 E; IX. 870 B; cp. Arist. *Eth. Nic.* I. 8, § 2).

The *Eryxias*, a short dialogue which has come down to us among the works of Plato, but which even the ancient critics agreed in considering spurious, deals with the subject of wealth in the spirit of this ethical estimate of the respective values of good things. The popular opinion that wealth consists in a quantity of money is refuted by the argument that there exist intrinsically worthless currencies, such as the leather coins or tokens used at Carthage, the worthless pieces of iron used in Lacedaemon, and the engraved stones used in Æthiopia.

The possession of quantities of such things will not make a man wealthy elsewhere (*Eryx*. 399 E-400 E). Wealth is shown to be what is *useful* to any one; what is useless to any one—e.g. a house to the nomad Scythian—is not wealth. More particularly wealth is found to be that class of useful things which supplies the wants of the body (400 E-401 E). The writer comes very near to putting in the additional qualification that they must be exchangeable; for he argues that those have wealth who possess arts by teaching which—"in exchange for which" (*ἀντὶ τοῦτ' αὖ*)—they can supply their wants (402 D). But from this economic point of view he passes on to the ethical conclusion that, since he who has the fewest desires is best off, the wisest may be the richest and the rich man the worst off (405 C-406; cp. 394 A). This dialogue has been ascribed by modern scholars, but on mere conjecture, to various members of the Socratic circle, such as Simon the cobbler or Æschines Socraticus, or to a pupil of Plato or of Antisthenes. It contains nothing really inconsistent with Plato's genuine works, but it probably represents the Cynic point of view, afterwards adopted by the Stoics. We may compare the Stoic paradox elaborated by Cicero (*Paradoxa* 6)—"That the wise alone is wealthy" (*Non cupidum esse pecuniæ est*). The writer, if later than Aristotle, which there seems no necessity to suppose, is in any case not influenced by *Pol.* I. 8-11. The *Eryxias*, being the oldest book we know of which isolates the subject of wealth for examination, may be called the earliest treatise on political economy; but it is so only in the sense in which Mr. Ruskin's later writings are economic treatises.

[J. Bonar, *Philosophy and Political Economy* (1893). Bk. i. ch. i. contains a full discussion of Plato.—Jowett's Translation of Plato, third edition, 1892, contains a translation of the *Eryxias*. On that dialogue cp. W. L. Newman's note on Aristotle's *Politics*, I. 9, 1257 b, 11, and C. Ritter, *Untersuchungen über Plato* (Stuttgart, 1888), pp. 84-86. On the influence of Plato's *Rep.*, see arts. CABET; CAMPANELLA; HARRINGTON; MORE; UTOPIAS.]

D. G. R.

PLAY, LE, see LE PLAY.

PLAYFAIR, WILLIAM (1759-1823), attempted in his youth with little success to combine the positions of inventor and tradesman. He went to Paris, and in 1789 became agent to an American Land Company, the operations of which were disastrous to those sent out. On returning to London he opened a "Security" Bank, which, however, soon collapsed. After Waterloo he returned to Paris as editor of *Galignani's Messenger*, but had to leave France to avoid imprisonment on a judgment in an action for libel. His publications were very numerous; many were directed against the French, and he advocated the issue

of forged assignats. In the *Gentleman's Mag.* (1823, pt. i. 564) is an imperfect list of forty-one pamphlets and books, among which, besides those mentioned below, are—

*A General View of the Actual Force and Resources of France, 1793.—Better Prospects to the Merchants and Manufacturers of Great Britain, 1793.—Letter to Sir Wm. Pulteney on the establishment of another Public Bank in London, 1797.—Statistical Tables, from the German of Boetticher, 1800.—Statistical Account of the U.S. from the French, 1807.*

[*The Dictionary of National Biography*, vol. 45.] H. E. E.

He published anonymously in 1785 *The Increase of Manufactures* . . . a proposal to establish a fund for lending sums of money at an interest suited to the circumstances of each case. In 1786 appeared *The Commercial and Political Atlas* (brought up to date in two successive editions 1787 and 1801), remarkable for the application of the graphical method to the statistics of finance. The method is thus introduced:—"Suppose the money that we pay in any one year for the expense of the navy were in guineas, and that these guineas were laid down upon a large table in a straight line and touching each other, and those paid next year were laid down in another straight line, and the same continued for a number of years, these lines would be of different lengths as there were fewer or more guineas; and they would make a shape, the dimensions of which would agree exactly with the amount of the sum" (*Atlas*, 1st edition; the illustration is varied in subsequent versions). By this method "as much information may be obtained in five minutes as would require whole days to imprint on the memory . . . by a table of figures." Thus ordinates at points on a horizontal line represent the amount of exports and of imports at each epoch; the difference between them—forming a stream of varying width—represents the balance of trade. That Playfair should give prominence to this conception is remarkable, as his observations on our trade with France evidence a just sense of the mutual interests of the parties to international trade.

*The Real Statement of the Finances and Resources of Great Britain, 1796*, contains some good remarks on the depreciation of money. "If money should decrease in value faster than the debts increase, then the burdens of the people, though nominally augmenting, may be actually diminishing." The rudimentary idea of an index number may be noticed in the *Appendix*, p. 29.

In the *Inquiry into the . . . Causes of the Decline and Fall of . . . Nations*, which appeared in 1805, Playfair pretends to apply his method to ancient history. In the preface he acknowledges obligation to his brother Professor John Playfair for the idea of the new method. In the same year (1805) Playfair published an edition of *Wealth of Nations*, which contains some acute criticisms; for instance, on Adam Smith's doctrine that "the more a man pays for the tax the less he can afford to pay for the rent" [of a house] (*Wealth of Nations*, bk. v. ch. ii.); and on Sir Matthew

DECKER's observation approved by Adam Smith that "certain taxes are in the price of certain goods, sometimes repeated and accumulated four or five times" (*ib.*). These are supplementary chapters on occurrences in finance subsequent to Adam Smith's time, and on the French "Economists." Playfair evinces some acumen as an economist as well as some originality as a statistician.

*The Increase of Manufactures, Commerce, and Finance, with the Extension of Civil Liberty proposed in Regulations for the Interest of Money, 1785* (anonymous).—*The Commercial and Political Atlas representing by Means of Stained Copper-Plate Charts, the Exports, Imports, and General Trade of England; the National Debt, and other Public Accounts; with Observations and Remarks.* by William Playfair, author of *Regulations for the Interest of Money*, . . . 1786 (2nd ed. 1787, 3rd ed. 1801).—*The Statistical Breviary, shewing, on a Principle entirely New, the Resources of every State and Kingdom in Europe; illustrated with Stained Copper-Plate Charts, representing the Physical Powers of each Distinct Nation with ease and perspicuity,* by William Playfair, to which is added a similar exhibition of the ruling powers of Hindostan, 1786 (and later editions).—*For the Use of the Enemies of England; a Real Statement of the Finances and Resources of Great Britain; illustrated by Two Copper-Plate Charts,* by William Playfair, inventor of Lineal Arithmetic, 1796.—*Lineal Arithmetic; applied to show the Progress of the Commerce and Revenue of England during the Present Century; which is represented by 33 Copper-Plate Charts. Being an Useful Companion for the Cabinet and Counting-House,* by William Playfair, inventor of this method of stating accounts.—*An Inquiry into the Permanent Causes of the Decline and Fall of Powerful and Wealthy Nations, illustrated by four Engraved Charts,* by William Playfair, author of *Notes and Continuation of an Inquiry into the Nature and Causes of the Wealth of Nations*, by Adam Smith, LL.D., and *Inventor of Lineal Arithmetic, Designed to show how the Prosperity of the British Empire may be prolonged*, 1805.—*An Inquiry into the Nature and Causes of the Wealth of Nations*, by Adam Smith, LL.D.; the eleventh edition, with notes, supplementary chapters, and a life of Dr. Smith, by William Playfair, 1805.—*A Letter on our Agricultural Distresses, their Causes and Remedies, accompanied with Tables and Copper-Plate Charts, Shewing and Comparing the Prices of Wheat Bread and Labour from 1565 to 1821.* Addressed to the Lords and Commons, by William Playfair. F. Y. E.

PLEASURE AND PAIN are the only motives taken account of in political economy in so far as "it makes entire abstraction of every other passion or motive but the desire for wealth; except those which may be regarded as perpetually antagonising principles to the desire of wealth, namely, aversion to labour and desire of the present enjoyment of costly indulgences" (Mill, *Unsettled Questions*, p. 138). This abstraction, legitimate within limits, is liable to be strained too far in several directions.

(1) Because economic action is ascribed to UTILITY, it is not to be taken for granted that, as utilitarians have postulated, all action is motivated by pleasure. For perhaps "all that mathematical economics need to assume is that a material quantity of goods will be in a certain proportion to a greater or less strength of motive; whether the motive be taken as 'pleasure' or not is not essential" (Bonar, *Philosophy and Political Economy*, p. 224; cp. Sidgwick, *Pol. Econ.*, bk. i. ch. ii. § 2 note; Marshall, *Principles of Economics*, 3rd ed., pp. 77, 78, note; and *Economic Journal*, vol. iii. p. 388). However, when equilibrium is regarded as the position of greatest advantage to all concerned (cp. Marshall, *Principles of Economics*, 3rd ed., 526-527, and note xiv.), the mechanical analogue being not so much the equality of forces (conceived by Jevons in his analogy of the lever, *Theory*, ch. iv.) as the maximum of energy (indicated by Irvine Fisher in his *Mathematical Investigation*), there is taken for granted the possibility of summing up pleasures which some opponents of utilitarianism have refused to grant.

(2) For the most abstract part of economics, the theory of exchange, it need not be postulated that each party acts from self-interest, but only that he is not actuated by regard for the interest of the other parties, those with whom he competes or bargains. The efforts and sacrifices which are required to supply markets—including the labour market and the loan market—are often incurred for the sake of one's family rather than oneself. The action of the family affections "has always been fully reckoned with by economists, especially in relation to the distribution of the family income between its various members, the expenses of preparing children for their future career, and the accumulation of wealth to be enjoyed after the death of him by whom it has been earned" (*Principles of Economics*, bk. i. ch. v. § 7, 3rd ed.).

(3) The limits within which self-interested action must be postulated may be even narrower than those indicated in the last paragraph. What is postulated is that action should be regular and therefore calculable, rather than that it should be self-interested (*Principles of Economics*, bk. i. ch. v.). "The range of economic measurement may gradually extend to much philanthropic action." F. Y. E.

PLEDGE. A pledge or pawn may be defined as a bailment or delivery of personal property as security for a debt or other engagement. A pledge must be distinguished from a MORTGAGE. By a mortgage the legal property in the thing mortgaged passes to the mortgagee. But a pledge only gives a special property to the pledgee, the general property remaining in the pledgor. Hence the rights of the pledgee commence only with possession,

and a pledge consequently is not within the bills of sale acts. If the pledgor does not fulfil his engagement and redeem the pledge, the pledgee may sell it, but of course, he holds any surplus in trust for the pledgor.

A person who makes a business of receiving pledges is called a pawnbroker, and for the protection of the poor and ignorant, pledges under £10 are subject to special regulations.

[See arts. PAWN; PAWNBROKING:—the Pawnbrokers Act, 1872 (35 & 36 Vict. c. 93), and as to pledges generally, see *Story on Bailments*, tit. Pledge.]

M. D. C.

**PLOUGHGATE.** An ancient Scots measurement of land = 8 oxgangs = 96 Scots acres (122 acres English) = about 590,400 square yards imperial. This measurement is, however, not consistently employed in the same sense in old charters (see **PLOUGH-TEAM**).

[Cosmo Innes's *Scotch Legal Antiquities*, p. 241.]

A. D.

**PLOUGH-TEAM.** In Anglo-Saxon times and perhaps throughout the mediæval centuries the usual plough-team in England consisted of eight oxen, but many instances of smaller teams, even to one ox, occur in Domesday and other records, and horses were not seldom mixed with the oxen. In some parts of England the latter had not been superseded by horses at the end of the 18th century (see **ARTHUR YOUNG'S TOURS**). It is probable that 120 acres were usually reckoned to one full plough, and a ploughland was the unit of land measurement. The size of the unit might and did vary, according to local custom, to the character of the soil, or to the division of the manor into two or three fields. (see **THREE-FIELD SYSTEM**). The word "carucate," and its subdivision "bovate" or "ox-gang," express land measures in terms of the plough-team. Dependent upon its use as a measure was the use of the plough-team as the basis upon which taxation was assessed, and much of the interpretation of Domesday depends upon the right understanding of the ploughland (see **PLOUGH-GATE**).

**PLUMART**, MARQUIS DE. See **DANGEUL**.

**PLUTOLOGY** (Gr. *πλοῦτος*, wealth). This term was used by Courcelle Seneuil to describe that part of his treatise on political economy which dealt with what is described by some more modern writers as "pure theory"; that scientific study of the results of the action of economic motives on men and societies to which the terms "economics" and "economic science" have been applied in the effort to escape the confusions which arose from embracing under the general title "political economy," both these more abstract investigations and the application of the knowledge thus gained, with

that derived from other sources, to problems of practical statemanship. To this second part of the subject the eminent French economist applied the term *Ergonomy*. The Australian W. E. HEARN adopted the title for his work, *Plutology*, or *the Theory of the Efforts to satisfy Human Wants*.

[Cp. *Traité Théorique et Pratique d'Économie Politique*, par J. G. Courcelle Seneuil, Tome i. Partie Théorique ou Ploutologie, Paris, 1858. *Plutology*, by W. E. Hearn, London, 1864, and also the article on HEARN in vol. ii.] A. W. F.

**PLYMOUTH ADVENTURERS**, THE, received a charter from James I. in 1606, to plant all the territory on the American coast, between 34° and 45°, and the islands within 100 miles. Letters-patent were issued to Sir George Somers, Richard Hakluyt, Edward Maria Wingfield, and others who should be joined with them. Two companies were ordered to be formed, one, the first or southern colony, the other, the second or northern colony. As the council of the southern colony was composed chiefly of residents in London, it became known as the London Company, and its jurisdiction extended from Cape Fear to the eastern end of Long Island, from 34° to 41°. The northern colony was called the Plymouth Company, because its council was appointed from Plymouth and the vicinity; its limits overlapped those of the other, extending from 38° to 45°, or from about the latitude of Delaware Bay to Halifax, Nova Scotia.

As regards administration, each colony was to be governed by a resident council of thirteen, to be appointed by the king; the laws enacted by them were subject to revision either by the king or the council in England. The people were granted no part whatever in the government. Trial by jury was allowed only in cases of capital crimes, defined as "tumults, rebellion, conspiracy, meetings, and sedition, together with murder, manslaughter, incest and rape, and adultery." Lesser crimes were to be tried before the president and council, and punished according to their will. Real estate was to be held as under the laws of England (see **LAND SYSTEM IN THE AMERICAN COLONIES**); for the first five years all personal property and the fruits of the labours of the colonists were to be held as a common stock, and each member of the community was to be supported from the general store. The established religion was to be that of the Church of England. The people were enjoined by virtue of such penalties as the president and council might inflict, to "kindly treat the savage and heathen people in those parts, and use all proper means to draw them to the true service and knowledge of God," as well as to lead them "to good and sociable traffic." This was the first constitution of government established within the limits of the present United States.

In April 1607 the London Company founded the first permanent English colony at Jamestown, on the James River, near Chesapeake Bay. English settlers were then only learning the art of colonisation, and most of those who went to Virginia during the first few years of its existence starved to death. Others, however, took their place, and the success of the Virginia plantations was ultimately assured. Tobacco cultivation was a prominent feature. All the early colonists were men, but the company encouraged the immigration of marriageable girls, and the settlers soon found themselves bound to the soil by ties of family responsibility. Labour continued to be scarce until 1619, when the problem was partially solved by the introduction of negro slaves. But as a commercial venture, the company was still a complete failure, and in 1619 the London Company inaugurated a new era by granting a modified form of self-government to the colonists. The Company still did not prosper, however. Among the chief causes were the rapid succession of governors, stimulating the rapacity of their dependants; the multiplicity of offices, by which industry was loaded and revenue absorbed; and the inability to conduct successfully a complex and arduous undertaking by a numerous body of men.

Meanwhile the northern company, which had never been satisfied with its rights under the charter that connected them with the South Virginia Company, urged its claims to a new patent so strongly that one was granted by the king, James I., in 1620. This defined the company's territory as extending from the 40th to the 48th degree of latitude. The Virginia Company loudly remonstrated against the new patent, but in vain; Sir Ferdinando Gorges, the governor of Plymouth, Massachusetts, eloquently argued the rights of the Plymouth Company before the English parliament. He urged the value of the fishing trade, which, even while they were disputing on boundaries, might, he said, be monopolised by French or Hollanders, and those who heard him were so satisfied by his representations that, in spite of all opposing influences, the king could not be induced to revoke the patent.

The Pilgrim Fathers settled in 1620 at Plymouth; ten years later, the colony of Massachusetts was founded by the English Puritans, to provide an asylum for themselves and their friends in the event of the struggle in England going against them. The council for the New England Company, as the successor to the Plymouth Company was called, gave them a grant of land, confirmed by the king, who conceded them in addition very extensive powers of government. Before the close of the 17th century all the territory within the original limits granted to the Plymouth Adventurers had been colonised,

and the settlers were given large powers of self-government.

But the original charters had been abrogated many years before this. In 1624 the Virginia charter was annulled, and the colony became a royal province. With respect to the Plymouth Company, between 1630 and 1635 serious complaints were made in England that discontented spirits full of disaffection to the king, and hostile to the Established Church, were settling on the lands granted by the company. The governor, Gorges, was attacked by the Puritans because of his large territorial claims, while in England he was assailed, as the upholder and author of the reputed licence of laws and opinions among the colonies of New England. Gorges felt this deeply after his long and arduous work in forwarding the plantation of English colonies in New England, and he "therefore was moved to desire the rest of the lords, that were the principal actors in this business, that we should resign our grand patent to the king, and pass particular patents to ourselves, of such parts of the country about the sea-coast as might be sufficient to our own uses, and such of our private friends as had affections to works of that nature." This policy was adopted in 1635, and the lands of the Company, lying between the 48th and 36th degrees of latitude, were parcelled out among its members. With this act, the history of the Plymouth Adventurers, as a separate organising and colonising body, came to a close. The Company had failed because it was unable to grapple with the religious, economic, and land problems which beset it. The king, being desirous of securing a better regulation government of the plantations appointed in 1635 a commission, with Archbishop Laud at its head, to make new laws and a new constitution for New England.

G. B. S.

POCOCKE, RICHARD (1704-1765), successively bishop of Ossory and of Meath, was one of the greatest travellers of his time. He entered Corpus Christi College, Cambridge, in 1722, and in 1733 received his LL.D. From 1733-1736 he travelled on the continent with Dean Milles, and from 1737-1742 visited the East.

In 1743-1745 he published *A description of the East and some other Countries* (2 vols. fol. London). He made other tours in Scotland, Ireland, and England, afterwards edited from his MSS. by D. W. Kemp. These publications have an interest for the economic student from the insight they afford into the social conditions of that time.

The following is a list of them:—*Tours in*

Scotland, 1747 and 1750 and 1760 . . . from the original MS. and drawings in the British Museum, edited by D. W. Kemp, with biographical sketch of the author, Edinburgh, 1887, 8vo.—*Pococke's Tour in Ireland in 1752*, edited with introduction and notes by G. T. Stokes, Dublin, 1801, 8vo.—*The Travels through England of Dr. Pococke*, 2 vols., Camden Society, N.S. xlii., xliv., 1888-1889.—*The tour of Dr. Pococke . . . through Sutherland and Caithness in 1760*, with introduction and notes by D. W. Kemp. A. L.

**POINDING OF THE GROUND** (Scots Law). Where a creditor has a security properly charged against the lands of his debtor and duly registered, or where he is the superior (overlord) and has a claim for feu-duties in arrears, he can, if he be not himself in possession of the lands or entitled to take possession, raise an action of poinding (empounding, pronounced pinding) of the ground, judgment in his favour in which will entitle him to the rents and to execution against all goods found on the lands, provided that these goods are the property of the owner of the land, or else that they are the property of the tenants up to the extent of the rent for the current term and of arrears of rent, if any, due by them at the time and no further. The superior poinding for feu-duties in arrears and for "casualties" is preferred to other creditors, and creditors are preferred *inter se* according to the dates of registration of their respective rights. A creditor, poinding before the trustee in bankruptcy is confirmed, gets priority over the trustee in respect of the whole movable property in the ground, to the amount of one and a half year's interest.

A. D.

**POLEGRAPHY.** (Greek,  $\pi\omega\lambda\epsilon\iota\nu$ , to sell). In the year 1870 M. H. Lefèvre, in a small treatise entitled *Traité des Valeurs mobilières*, explained in outline a graphic method of his own invention for the representation of combinations of operations on the stock or produce exchanges. This method was greatly extended and developed in the work *Le Commerce*, published by the same author some fifteen years later (the date of publication is not shown on the volume itself). Its author claims for it that it greatly simplifies the task of obtaining a clear view for practical purposes of complex combinations of exchange operations, rendering their principles much more evident than laborious illustration by numerical examples, and enabling an instructor to achieve more certain and rapid success with indifferent pupils than could be attained by ordinary methods with those of more than average intelligence, resting his claim on actual experience.

It is proposed to give here such brief outlines as may elucidate the principles of the method, and the range of its applicability, referring to M. Lefèvre's own expositions for more detailed explanations and elaborate treatment of the

many leading varieties of combination and their appropriate diagrammatic presentation.

The real utility of this method is undoubtedly connected with its application to combinations of ordinary purchases and sales for future delivery with purchases and sales of **OPTIONS**; **PUR** or **CALL** as the case may be. The application to definitive purchases and sales for future delivery is of the simplest, but does not appear to present sufficient advantage to justify the introduction of a new method. When the option or privilege is combined with the definitive purchase or sale, a complex state of affairs results, the outcome of which can be advantageously studied with the assistance of the diagrammatic method.

The purpose of the diagram is to determine or to represent the amount of the *difference* to be paid or received as the result of a series of bargains, and it is sufficient if the gain or loss per unit dealt in be shown per £10,000 of stock, or per 50,000 bushels of wheat for example, transactions involving multiples or sub-multiples of the unit selected being readily adapted to the same diagram, as will be seen shortly.

The only apparatus necessary for the construction of the diagram is a piece of squared paper, a pen or pencil, and a ruler. Along a selected line on the paper is marked the series of possible prices of the stock or commodity dealt in, as shown in the annexed diagram (Fig. 1) where the range of price 102-104½ of a stock is capable of representation, each movement upwards of ½ in the price being represented by a movement to the right by the width of one square. If we were concerned with cotton, the width of each square might represent a variation of ¼th of a penny per pound.

Fig. 1.—Simple purchase or sale.

The gain or loss per unit dealt in is similarly represented by distances measured upwards or downwards from this central reference *line of prices*.

The line *Bb* on the diagram represents the position of a buyer of £100 of the stock concerned at 102½ for the next account. If the price rise to 103½, and he sell at that price, he will net a gain of ½ per unit, which is represented by the fact that the line *Bb* cuts the

vertical through the point on the line of price corresponding to  $103\frac{1}{2}$  at a distance  $\frac{1}{2}$  on the *gains* side of that line (omitting brokerages for the present). Generally the point at which the line  $Bb$  cuts any particular vertical indicates the gain or loss resulting from a sale, at the price corresponding to the position of this vertical, of the stock for which the buyer contracted to pay  $102\frac{1}{2}$ . A glance at the diagram shows the answer to the question,—"Shall I gain or lose, and how much will the amount of such gain or loss be, if I sell at the current quotation (whatever that may be) the stock bought at  $102\frac{1}{2}$ ?"

If we wish to include brokerages it is clear that we must add in the case of a purchase, or deduct in the case of a sale, the amount of the brokerage from the current price before constructing the diagram, or we may calculate these separately.

The line  $Ss$  similarly records the position resulting from a sale at  $103\frac{1}{2}$  for future delivery. The *difference* to be paid or received when, for the fulfilment of the bargain, a purchase is made at some other price, being indicated by the intersection of  $Ss$  with the vertical through the price of the said subsequent purchase.

All this is very simple, and shows no very apparent advantage over an arithmetic record. We proceed, therefore, to deal with a combination of two purchases, and of a purchase and sale where the amounts of the two transactions are not identical. When a purchase and sale of identical amounts are combined, the resultant indicates a definite gain or loss unaffected however the market may subsequently vary. This is not the case when the sale and purchase are concerned with unequal amounts, and when two purchases or two sales are combined.

Fig. 2.—Sale with purchase of half as much again.

In Fig. 2 the line  $Ss$  represents, as before, a sale of one unit at, on this occasion,  $99\frac{1}{2}$ .  $Bb$  represents a purchase of half as much again at *par*. By inclining the line  $Bb$  so that it rises *three* squares for each *two* squares crossed in passing to the right, we represent the effect of the increase of quantity in the proportion of *two to three*, i.e. we get the case of *half as much*

again. The *resultant* of the two lines  $Ss$  and  $Bb$  is  $Rr$ , which represents a purchase of *one-half*. To draw  $Rr$  we need only determine two points on it, since it is a straight line, remembering that it is to represent the *sum* of the gains or losses involved in the two transactions before named. One point on  $Rr$  will therefore be where  $Bb$  cuts the vertical through  $99\frac{1}{2}$ , a price which registers neither gain nor loss in respect of the transaction represented by  $Ss$ . Similarly a second point on  $Rr$  is where  $Ss$  cuts the vertical through  $100$ , a price where  $Bb$  represents neither gain nor loss, though  $Ss$  shows a loss of  $\frac{1}{2}$  at this price. The two transactions together are equivalent to a purchase of *one-half* at  $101$ ,—i.e. the operator will lose on the combination so long as the price remains below  $101$ , the amount of the loss being only half as great as if a purchase of a unit of commodity or stock at  $101$  had been the actual bargain made. Fig. 3 shows the

Fig. 3.—Two purchases of different amounts combined.

resultant  $Rr$  of the combination of the purchases  $B_1b_1$  of a unit at *par* and  $B_2b_2$  of two units at  $99\frac{1}{2}$ , which is laid down by the same rules as before. It will be found that however many purchases or sales be combined, the *resultant* is always a straight line so long as the purchase or sale is *definitive*.

The case of an option introduces a form other than the unbroken straight line for the resultant; and the combination of different option bargains among themselves, and with definitive sales or purchases, affords examples of broken lines of all degrees of complexity.

The diagrams for simple call and put options are shown in Figs. 4 and 5, the line  $Ss$  showing the position of the seller,  $Bb$  that of the buyer in each case. Fig. 4 is the case of a *call* option for which the price of  $\frac{1}{2}$  per unit of the stock is paid, brokerage being neglected in this preliminary explanation of the diagram. To include brokerage, the lines representing the transactions must be lowered (i.e. moved bodily towards the *losses* side of the line of price) by the amount of the brokerage. In Fig. 4 then,  $Bb$  indicates the position of a buyer,  $Ss$  of a seller

of the right to demand delivery at  $86\frac{3}{4}$ , the price paid for that right being  $\frac{1}{2}$  per cent (or per mille or other unit taken by way of

Fig. 4.—Call option.

illustration). If the price do not rise above  $86\frac{3}{4}$ , the buyer simply forgoes his right and loses his premium, this being the limit of his loss. If the price rise above this figure, the loss of the buyer or gain of the seller decreases, and at prices above  $87\frac{1}{4}$  the option yields profit to the buyer, who can realise this profit by requiring delivery at  $86\frac{3}{4}$ , and selling again at the price of the day. The seller of the option, if he do not hold the stock, must purchase at the price of the day in order to fulfil his contract, and his gain turns into loss when the price rises above  $87\frac{1}{4}$ , more than the whole of the price received being then required to cover the difference between his buying price and the  $86\frac{3}{4}$  at which he has contracted to sell. The fact that part of the lines *Ss* and *Bb* is horizontal, indicates that over the range of prices corresponding to these parts of the line the loss or gain is a fixed one, independent of the particular price.

In Fig. 5 the case of the *put* option is

Fig. 5.—Put option.

similarly presented, *Ss* showing the seller's position with limited possibility of loss, *Bb* the buyer's position with limited possibility of gain.

The double option, or straddle, the combination of put and call, is represented in Fig. 6, which shows the position of the payer of the double price for the option. The case represented is that of the payment of a price for the option of  $\frac{1}{2}$  per unit (per cent, per mille, etc., as the case may be, the diagram assumes

£100 of stock as the unit) for the right to either demand delivery or require acceptance of stock at the price  $93\frac{1}{2}$ . At prices below  $93\frac{1}{2}$  the line *Ss* sloping downwards indicates that the operator

Fig. 6.—Straddle. Position of the payer of the premium shown by *SsBb*.

is a seller. At prices above  $93\frac{1}{2}$  he is a buyer, as indicated by the part *Bb* of the line sloping upwards. In fact, if the price be below  $93\frac{1}{2}$ , the payer of the price for the option will buy in the market at the market price and sell, in accordance with his contract, at  $93\frac{1}{2}$ . It is clear that if the price remain between 93 and 94, the payer of the price for the option cannot recover his price for the option by his operations. At any price outside these limits he stands to gain on the whole, his gain more than covering the price paid for the option. Here again brokerages are omitted; if they are to be included, the whole line *SsBb* must be vertically lowered to the extent of the brokerages involved.

The position of the receiver of the price paid for the option would be represented by the broken unlettered line on the diagram.

Fig. 7 represents the resultant of the com-

Fig. 7.—Definitive purchase combined with sale of a call option.

bination of the definitive purchase of a quantity of stock, and the sale of a call for the same quantity. The price received for the call is taken at  $\frac{1}{2}$ , the price at which the option may be exercised being  $67\frac{3}{4}$ . With this is combined a definitive purchase at  $67\frac{3}{4}$ , and the resultant *RRR* shows that the combination is equivalent to a purchase of a put at a price for the option of  $\frac{1}{4}$ .

The combinations of various options with one another, and with definitive purchases and

sales of stock, may be worked out in the manner adopted for this case and for those shown in Figs. 2 and 3. To the combination of any two we may add a third, then a fourth, and so on to any number. One example of the *resultant* of several transactions in which brokerage is afterwards taken into account, may serve to show both the possibilities of the method, and the strange forms which resultants may assume. This example is one given by M. Lefèvre, and refers to a number of transactions in French 3 per cent rente. The different items are as follows:

Date.	Nature of transaction.	Amount of rente concerned.	Price.	Premium.
1st	Purchase . .	3,000	86.70	
2nd	Sale of call .	12,000	87.25	25 cm.
3rd	Purchase of call	9,000	86.55	25 "
4th	Sale of call .	3,000	86.45	50 "
5th	Purchase of call	3,000	86.35	25 "
6th	Sale of call .	6,000	86.25	25 "

The individual transactions are represented by dotted lines, the unit representing 3000 francs of rente. To avoid confusion, the horizontal parts of the lines representing the options are not traced, a large dot indicating where they begin. In this case all extend to the left of the dot. It appeared also to be desirable not to continue all these dotted lines beyond the central price line, though of course they do really extend indefinitely beyond that line. The gross resultant is shown by the thin broken (or bent) line in the diagram, indicating an apparent gain to the operator so long as the price remains between 85.70 and 87.12½. This indication is greatly modified by the introduction of the brokerage of 40 francs per 3000 of rente, giving 0.48 per unit on the whole series. The depression of the resultant by the corresponding amount brings it into the position shown by the thick line on the diagram, showing an altogether different situation.

The net resultant on the diagram (Fig. 8) may be read off thus. At prices below 86.25 the operator is a buyer of 3000, between 86.25 and

Fig. 8.—A complex combination. Brokerage included.

86.35 he is a seller of 3000, between 86.35 and 86.45 he is neither buyer nor seller, but is a loser of 3 centimes per unit, between 86.45 and 86.55 he is a seller of 3000, between 86.55 and 86.75 he is a buyer of 6000, and over 86.75 he is a seller of 6000. The positions of gain or loss realisable on making the sales or purchases necessary to cover the position thus stated are shown by the height above or depth below the central line at which the thick re-

sultant on the diagram cuts the corresponding price vertical.

In view of the fact that simple straight lines are the only possible form of *resultant* when options form no part of the transactions, it might almost be said that this method can only be applied with real gain when options are a common form of transaction. As it appears that the option is becoming of greater importance than formerly, this fact may serve as an

excuse for explaining at this length a device which claims to render the arithmetic of such bargains more simple and intelligible.

It is scarcely needful to say that the method is applicable to dealings in wheat, cotton, iron, etc., as well as to dealings in stocks and shares.

[The only writer who appears to have treated this subject in detail is the inventor of the method, M. Lefèvre, formerly private secretary to the late Baron James de Rothschild. To his work *Le Commerce* alone, therefore, we must refer for fuller treatment, the earlier work mentioned above being both less complete in its treatment and no longer obtainable.] A. W. F.

POLICE before this century meant the internal regulations by a government; or in a secondary sense, the instruments by which or the purpose for which such regulations were enforced. Thus in HUME (*Ph. Works* (1875), iii. 298, 299), and A. SMITH (*W. of N.*, ed. McCulloch, pp. 314, 328), it means "regulation," "the administrative," or "order." But a school of practical thinkers, mainly German, beginning with v. OSSE (*Testament* (1556), ch. xx. *Von einer guten Policey*), and ending with v. MOHL (*Polizei-Wissenschaft* (1832) (1865)), and of theoretical politicians, first French, then German—under whose influence *Ordonnances pour la police* (5th May 1399; 21st Apr. 1667, etc.), *Reichs-Polizei-Ordnungen* (1442, 1530, 1577, etc.), and "Landes-Polizei-Ordnungen" (e.g. those of Frederick the Great) were issued—narrowed the meaning of the word on five sides. (1) In THOMASIVS' time (see *Testament*, ed. Thomasius (1717), n. 105), judicial procedure had long since been relegated to a sphere of its own. Thus the famous ordinance of 1667 appointed a lieutenant-general of police for Paris, because the functions of police and justice hitherto combined were "often incompatible"; and Frederick the Great adopted a similar policy in order to secure judicial independence. Judicial procedure included legal capacity, the law of evidence, etc. (2) "Police" was confined to matters in which the public had an independent interest. Thus De la Mare's Preface (*Traité de la Police* (1705) and v. Bielfeld's *Institutions Politiques* (1760) write of "la police" as synonymous with "l'ordre public" or "le bon ordre de la société en général"; and Blackstone (1765) as "the due regulation and domestic order of the kingdom." And this distinction between public and private law was identified with a distinction between mutable and immutable law: "police laws vary according to place and time: laws of justice must be uniform, constant, and immutable" (Von Berg, *Handbuch des deutschen Polizei-Rechts* (1799), i. 132; Hooker, *Laws of Ecclesiastical Polity* (1594), I. x. 7, 10). (3) Hooker defined "polity"—which is the same word as police—thus: "it containeth government" (constitutional law), "and also whatever besides

belongeth to the ordering of" the state "in public" (III. ii. 2); (he wrote "church" because of the adjective in the title of his book). Now these continental writers were absolutists, therefore they did not touch the larger constitutional problems which vexed English writers from LOCKE (1694) to SEELEY (1896). And they treated constitutional details as administrative, so that when first principles were put into the melting-pot in 1788 men had forgotten that police once meant the law of the constitution. And further—until MONTESQUIEU (1748) French writers, until SOLEN (1812) German writers, and until 1850 Prussian statesmen, blended legislative and executive duties. Locke's protest against amphibious extemporary decrees and the Code Pénal, art. 127, were aimed at this school. Now that these functions are separated by a gulf, writers on police justify their habit of looking on the legislature as ancillary to the administration by writing "dictionaries of the administration" like M. BLOCK (1854-92), or on "administrative law" like GNEIST, (1857-84), v. STEIN (1865-88), MEYER (1883-98), LOENING (1884), and HUC DE GRAIS (1881-97), or administrative codes as in Portugal (1878). (4) DITHMAR, first professor of "economic police and cameralistic (financial) sciences" at Frankfurt on the Oder (1727), first separated these three sciences, but only partially. They were still regarded as concentric circles of which v. SECKENDORF's patriot king was centre, and v. JUSTI (1761) still repeated but refined v. SCHRÖDER's epigram "police sows but finance reaps," and protective duties were still praised as the meeting-point of the three. But revenue and wealth were after all distinguished, and economy, when contrasted with police, left some scope for freedom.

Adherents of the police-school—in these first four phases—have passed upon slavery, the inquisition, censorship of the press, and Napoleonic espionage, the blessings of the scientific. Again moral, sumptuary, and usury laws, and the mediæval pricers and viewers and regulators of trade, have under its ægis survived their native guilds and towns. It has never known its limits. The Prussian code (1794) states one limit thus: the state only *supplements* self-help (ii. 17, 2). The French laws, under which the public prosecutor gets his newspapers gratis, or the mayor registers foreigners who have a business (1893), or the commissary of police attends and, in case of disorder, dissolves public meetings (1881), or some employees still need certificates of employment (1890), sound arbitrary to English ears, but represent the high-water mark of free thought and industry to the continental mind. Modern Germany, which has had a more continuous history than France, has supplemented the traditions of the police-school with the opposite principles of individualism and liberty. English economists in pursuing a reverse method—witness A. SMITH and J. S. MILL's fifth books—arrive at

a similar result. But the two schools have not yet quite met.

But it is to the police-school that we owe registrations of births, deaths, and marriages (OBRECHT, 1608), the census, the creation of peasant proprietors out of the wrecks of feudalism, Sabbatarianism, compulsory education (Prussian Code (1794), ii. 12, 43), and the idea of the duty of the state to counteract the mental superiority of employers by Employers' Liability Acts and other social legislation (Hoffman, 1841). Trade licenses also came to us through this channel, but are now mostly limited to dangerous trades (poisons, drugs, arms, etc.)—a limitation which suggests the fifth phase of the police-school.

(5) A further shrinkage of the term occurs in modern codes. (a) Thus the Prussian code of 1794 (ii. 17, § 10), looking at the function from the point of view of the functionary, directs the police "to take the necessary means to maintain public peace, safety, and order, and to ward off dangers to the public or any member thereof"; and the *Code des délits* (1795) takes a similar view. This definition is too wide, for, if pressed, it would include justice and education which have diminished crime, and Irish land laws which were meant to clip the wings of a "criminal conspiracy"; but it is only meant to include non-judicial measures exclusively meant to prevent dangers to life, health, morals, property, or the social organism. (b) The *Code Penal*, bk. iv., identifies "contraventions de police" with offences entailing penalties of five days' imprisonment or fifteen days' fine *plus* damages, if any; Anhalt-Dess (1855), Baden (1863), Bavaria, Württemberg, and Hesse (1871), have published codes enumerating offences against police, but the best definition of police offences is that, unlike crimes, they have nothing to do with the wish or intention of the accused. This is the vital point on which the Italian (1890), following the German (1872) penal code, lays stress; those who attempt or help crimes are guilty, and those who do not intend crimes are guiltless; those who attempt or help offences are guiltless, those who do not intend offences are guilty. From (a) and (b) we get our two modern conceptions of police, as (a) out-of-court criminal procedure; (b) as an administrative and judicial sphere of action which prevents or punishes accidents caused by human carelessness or misfortune or pure misfortune. Both conceptions are unscientific, but meet in the policeman. And of policemen there are two main varieties (W. Roscher, "Geschichte der National Oekonomie in Deutschland," in the Munich *Akademie der Wissenschaften*, vol. xiv.—Conrad Loening, etc., *Handwörterbuch zur Staatswissenschaften*, s.v. "Polizei."—A. Smith, *Lectures on Justice, Police, Revenue, and Arms*, ed. E. Cannan, 1896).

*The Policeman in England.*—England started with the fifth meaning of police over 600 years ago. The idea did not emerge from metaphysical mist, so that discussions about the first four meanings are irrelevant here. And in England offences and minor crimes are confused under the name misdemeanour, so that the policeman naturally takes charge of

all crimes; and popular imagination, which in defiance of history conceives of the magistrate as essentially a judge of crime, associates the man fined for cleaning his bicycle in the street with wife-beaters and the like, especially when the fine is enforced by a constable armed with a distress warrant. And in England we built from the ground upward, not as in France and Lagodo, from the roof downward.

(1) In the 13th century every citizen had to arm himself, and was liable for crimes in his neighbourhood; highways had to be kept clear of bushes, etc., and town-gates closed at night (13 Edw. I. st. 2). (2) Town-bailiffs, assisted at night by hired watchmen, high constables in hundreds, and petty constables in townships, being "wardens of the peace," inspected and reported on these arrangements, and had powers of arrest which exceeded those of a citizen. The idea of the local warden of the peace takes us back to the village community. (3) In 1327 the crown appointed special "wardens of the peace" in each county, who in 1362 became criminal judges under the title "Justices of the Peace," besides being "wardens of the peace." Gradually town-bailiffs and constables of the hundred died out, and petty constables became subject to the J.P., executing and serving his warrants and summonses, whether issued by him *qua* warden or *qua* judge. The main duties of the J.P. were and are as warden. Thus to-day the J.P.s may, if some one swears, and they think there is danger, name special constables in any place in their jurisdiction (1 & 2 Will. IV. c. 41) or parish constables for a year (5 & 6 Vict. c. 109; 35 & 36 Vict. c. 92), and their nominees, unless specially exempted, must serve. They are heads of the potential, conscript constabulary. Further, they certify lunatics, "commit for trial" in serious cases, and like the inspector-constable in small misdemeanours, imprison or admit defendant to bail pending trial. In form "committal" is a trial, in substance a mere certificate that the accused has a fair case. Again, until 1888 they were the rural local governing body, and by means of bye-laws, orders, and licenses, looked after highways, the slaughter of diseased animals, precautions against fire, etc.; they also imposed rates. Both in town and country they still hear rating assessment appeals, enforce payment of rates and orders for the removal of nuisances, etc., or, in most cases, payment therefor, these being all reckoned judicial duties; and their licenses to publicans and billiard-room keepers are a last trace of "la police des mœurs." Again they were once heads of what was called on the continent economic police. From 1562 until this century they could fix wages, enquire into apprenticeships, and act as labour-masters in an age when England was looked on as a vast workhouse; and under laws of 1709 and 1758 priced bread and inspected bakers' weights and measures (5 Eliz. c. 4; 8 Anne c. 18; 31 Geo. II. c. 29, repealed 1867)—they still may inspect weights and measures—and punished offenders. In these matters constables are or were always their assistants, for J.P. and constable are growths from

the same root, and once differed only in degree. (4) A professional police force grew up in towns, but their employers were no longer the J.P.s as such. (a) Under the Municipal Corporations Act, 1835, the elected mayor is J.P. for the town along with the ex-mayor and other nominees of the crown; but the mayor and elected town council cope with accidents arising from drains, buildings, fires, noxious trades, etc., by bye-laws, orders, and licenses, and a committee thereof, called the watch committee, usually control traffic by the same weapons, and always appoint a professional police force similar to that which was established in London. (b) London, outside the city, borrowed its first arrangements from Dublin. In Dublin, in 1723, unpaid constables elected by the parish looked after paid "supervisors of the watch" and "watchmen." In 1765 paid "inspectors" were wedged in between supervisors and watchmen. In 1777 one alderman, called by the Frenchified title "president or guardian of the police," looked after this machinery. In 1786 paid "commissioners of police," who were also J.P.s for all Dublin, hired paid constables, watchmen, and other "ministerial officers of the peace"; at the same time paid divisional magistrates were appointed. In 1795 "superintendent magistrates" replaced the commissioners. This scheme passed to London in 1792, except that the divisional magistrates acted as superintendent magistrate in each division. H. FIELDING (*q.v.*) had called attention to the need of strengthening the hands of the justices half a century before. In 1829 all the paid "watchmen and other ministerial officers of the peace" were made into constables,—superintendent, inspector, sergeant, and plain constables,—and the divisional forces were combined into one "metropolitan police force," and were governed at first by two paid non-judicial magistrates, but since 1856 by a paid commissioner and two paid assistant commissioners of police, who are non-judicial magistrates; these non-judicial magistrates may not attend quarter or general sessions, nor may they try, nor have they committed prisoners. They are appointed by the crown, and are under the home office. This system returned to Dublin in 1836, where it still exists. (c) A modification of these systems was introduced into counties in 1839 permissively, and in 1856 compulsorily. Until 1888 J.P.s in quarter-sessions appointed, with the approval of the home office, a paid chief constable, and determined the numbers of his force; and he, subject to the J.P.s, engaged its personnel. Now a committee of J.P.s and of the elected county council has succeeded quarter-sessions. (d) A similar system has been instituted in Scotch boroughs (1833) and counties (1857). (5) J.P.s and watch committees, and in the metropolis the commissioners, report annually to the home office, which sends round inspectors; only half of the pay of the police force, except in the city of London, comes from local sources, and of that half such part as comes from agricultural land is, since 1896, exempted to the extent of one-half by imperial contributions. No power is exercised by any central authority over local police authorities, nor is there any "general" police like the French *gendarmes*

except in Ireland, outside Dublin, and most of the colonies. True, under the Police Act, 1890, § 25, different police forces may help one another if their heads agree to do so; and warrants, if "backed," bind the police in the district of the J.P. who backs them, and the lord chancellor and judges of the queen's bench division are wardens of the peace and issue warrants for all England and Wales. The police forces, though not centralised, are uniform and allied and act together.

To sum up: the duties of citizen, constable, and J.P. have for six centuries shaded off into one another, and only gradually settled down into distinct organic shapes; the last stage in the process was when watchmen *plus* amateur constables were converted into paid watchmen-constables during last century. The central link was always and is still fragile.

The powers and duties of the professional police force are all derived from their being constables, *i.e.* wardens of the peace, but are enlarged by statute law. They now include (1) *inspection* in public places. Domiciliary visits are made with the aid of a J.P.'s search warrant in case of stolen goods, sheltered criminals, etc., or by the police constable *qua* inspector under some statute. Thus he inspects public-houses, billiard-rooms, and threshing machines, and—side by side with medical officers, inspectors of nuisances, weights and measures, and markets—inspects and samples food and drugs exposed for sale; and may be ordered by the local government board to do sanitary work which sanitary inspectors leave undone. In the case of explosives there are central and local inspectors, the former appointed by the home office and the latter, a "superior officer of police." Obstruction to inspectors or constables doing their duty is a misdemeanour. (2) In *examining* the police constable is at a disadvantage, as he is instructed to caution before arresting his victim. Purely inquisitory legal proceedings are rare; of those that do exist, public inquests by coroners, or by a J.P. in pursuance of the extraordinary Explosives Act 1883, are—private examinations by factory inspectors, public enquiries by board of trade or home office into accidents are not, assisted by police constables. (3) As for *arrest*, the citizen can only arrest suspected felons if a felony has been committed, and red-handed misdemeanants if dangerous, and must arrest only if a constable requests him (*Law Reports*, i. C. C. R. 20). In addition to this, pawnbrokers, railway-guards, workhouse-masters, landowners and their keepers have certain powers in certain cases. In all these cases and some others the constable has a duty and there is no "if." An equal duty to inform against or arrest lunatics at large is cast on overseers, relieving officers, and constables by the Lunacy Act, 1890. In 1895 the constable arrested eight out of nine bad, *i.e.* indictable criminals, on his own responsibility. The inspector constable also admits trivial misdemeanants to bail before summary hearing. (4) "As to *accusation*—unless there is a special inspector charged with the duty, the head of the local police usually prosecutes offences in public places which come under his notice. As

accuser and witness he has in theory no advantage. Local heads of police also report crimes and offences to the treasury solicitor who is directed by the attorney-general to prosecute capital cases, governmental cases, our "police politique" cases reported to him by judges, etc.—amounting in all to about 1 per cent of the bad, *i.e.* indictable crimes in 1895. There is nothing in England like the Scotch procurator-fiscal or Irish attorney-general, who cover the whole or nearly the whole field of crime. (5) Provision against or in case of accidents is made by county and town councils, by their fire brigades and by so many other public local bodies, that the lost and found property office at Scotland Yard, the stretcher and necessary addresses in each station, the help to the man suddenly taken ill or strayed child, are slender reminiscences of a time when police was the sole weapon with which society fought accidents. (6) *Orders*, etc.—"Chief officers of police" license pedlars, hawkers, and sweeps; and in the London metropolis the chief commissioner licenses cab and omnibus drivers; and orders certain traffic or all through traffic out of certain streets at certain times. Otherwise bye-laws, orders, and licenses, with one or two exceptions reserved to the J.P., have drifted away to elective bodies. (7) In civil process police constables execute the distress warrant by which the J.P. enforces payment of rates, fines, and compensation. Indeed the constable and J.P. are for practical purposes co-extensive; consequently recent statutes which give to the J.P. certain landlord and tenant disputes where the tenant's rent is under £20 per annum, and the settlement of wage disputes of London bargemen, have made the police constable intrude into an arena for which he is unfit. (8) *Arms and discipline*.—Unlike the foreign gendarmes and Royal Irish Constabulary (outside Dublin) the English police force is non-military, does not live in barracks, and is usually unarmed except with a hidden truncheon. A month's notice of resignation is required under a penalty of £5 *plus* arrears; neglect of duty is punishable by a £10 fine or a month's hard labour. In Ireland a £5 fine is inflicted for the latter, a £10 fine or three months' hard labour for the former offence. Both in Ireland and England J.P.s—*i.e.* the masters—impose the penalty on the men, but after judicial process.

[For history and theory see P. Colquhoun, *Treatise on the Police of the Metropolis*, 1796.—J. Toulmin Smith, *The Parish*, 1857.—R. Gneist, *History of the English Constitution*, translated by P. A. Ashworth, 1891.—F. W. Maitland, *Justice and Police*, 1885.—Shaw, *Municipal Government in Great Britain*, 1895. For present law and facts see Haycraft, *Powers of the Police*, 1897.—C. M. Atkinson, *Magistrates' Annual Practice 1897*.—*Parliamentary Reports, Annual Judicial Statistics*.]

*The Policeman in France*.—The French separate administrative from judicial police, the former preventing, the latter investigating and bringing before the courts, crimes and offences. (1) The administrative police, if general, is exercised by some minister—usually the minister of the interior or home office, who instructs and orders his inferiors

with or without the help of the council of state; but licensing of plays is assigned to the minister of education; inspection of weights, measures, and insanitary food to the minister of commerce; highways and public vehicles to the minister of public works, etc. Each minister acts as agent of the president of the republic. Outside Paris, the president nominates prefects of departments, who, with or without the help of the selected *conseil-général* of the department—issue to the public bye-laws, *arrêts réglementaires*, or orders and licenses, *arrêts individuels*, as to slaughter of diseased animals, precautions against fire, etc., subject to the veto of the minister concerned. "Commissaries of Police," nominated by the prefect in towns of less than 6000 inhabitants, otherwise by the president, have jurisdiction over the town or commune to which, or to part of which, they are attached. There must be one for a town of 5000 to 10,000; and one more for each additional 10,000 inhabitants. They act under the prefect in "general" and under the mayor in "municipal" police; and can command the services of the watchmen and keepers, but can only "request" officers of gendarmerie to help them. Mayors are unpaid, and elected by and from the elected town or communal council. In general police they are agents of the prefect, but are heads of "municipal" police, streets, public health, repairs, etc. They issue to the public bye-laws and orders subject to the prefect's veto; but in local finance, public works, and property, are subject to "the controul" but never to "the authority" of the town or communal council. They appoint "keepers," *gardes champêtres et forestiers*, who patrol and look after parks, forests, harvests, etc., and are under "surveillance" of the gendarmerie; and if urban, they appoint watchmen, *agents de police*, whose organisation is settled in large capital towns by the president, and being borrowed from England, always follows the English patterns of 1829-1835—thus their officers are superintendents (chefs), inspectors, and brigadiers, and they patrol the streets unarmed, and besides keeping the peace, relieve in cases of things lost or found, accidents, ignorance of the way, etc. Fire brigades are organised by communes and towns, under orders from the prefect, the superior officers being nominated by the president, and the members being soldiers under military law but subject as to their duties to the home office. The gendarmerie is the old feudal, then monarchic force; now it is, like the fire brigade, a military force told off to public duties anywhere, under the civil ministries; unlike the Prussian gendarmerie, it is also under the war office; it patrols town and country, but looks especially after the country, and acts under its officers, whose prefect or commissary "requests" the officers to act.

In the above sketch sub-prefects of *arrondissements*, and their elected councils, often thrust in between mayor and prefect, deputy mayors and different kinds of commissaries, are omitted. Again, the president usually acts on the advice of the home office. Again, the elected councils, originally financial and consultative, have only since 1884 advanced to the stage of "controlling" (they can never dictate to) the official in certain

cases. Again, before 1884, the mayor was a nominee of the president in important towns, and could not nominate his keepers and watchmen. Further, Paris is differently constituted. In Paris, two co-ordinate functionaries, the prefect of police and of the Seine, perform the duties usually associated with general and municipal police respectively; the gendarmes are called the garde republicaine; there are 75 commissaries attached to 80 quarters; there are 80 police stations in each quarter, under an *officier de paix*, who can command three brigades of watchmen (called "wardens of the peace," *gardiens de la paix*); and there are other commissaries and brigades told off to special duties; the superintendent of the watchmen is appointed by the prefect of police, and the *officiers de paix* by the home office (*Règlement général*, 30, 4, 1887). Lastly, inspectors of factories, whose functions since 1893 are enlarged, and of weights and measures, surveyors of bridges, and the like, who are directly under the central administration, are classed as "special police subordinates."

To sum up: administrative police occupies the entire ground of local government, less finance and education. It is a bureaucratic hierarchy in which executive virtue descends drop by drop from the president down to the humblest gamekeeper; and the inferior showers back incessant reports on his immediate superiors. But there are two qualifications. The mayor is now in reality as well as in name an independent centre, whence the powers of municipal police radiate. Representative councils have begun to encroach upon personal power, and in spite of their centralisation there are always two rows of police subordinates—civil and military—and the urban and rural civil police subordinates differ in origin and essentials.

(2) The judicial police include the procureur-général, procureurs de la République, juges d'instruction and juges de paix, in addition to the administrative police. Their duties are as follows:—(a) *Force*—Every policeman must take a criminal caught red-handed, etc.—the etc. is important—before the public prosecutor; but so must every one if requested (*Co. Pén.* 475, 12°). In other cases a police officer, i.e. procureur, juge, préfet, who never acts except sometimes in Paris, commissary, mayor, or officer of gendarmes, issues, and serves, and enforces by a common policeman, or usher of the court, summonses and warrants. It is a minor crime to obstruct a policeman or any one when doing their duty (*ib.* 222-24); (b) *Investigation*—On receipt of a written information by any one, whether aggrieved or not, the policeman questions the suspect, and examines witnesses in private. But only the police officer can invade houses; (c) *Proof*—Watchmen may investigate but cannot "prove." Again, sub-officers of gendarmes, keepers, "special policemen," and revenue officers, may prove certain offences and minor crimes. Again, officers other than the "procureurs," or "juges d'instruction" prove "offences," and, where the criminal is caught red-handed, etc., crimes; otherwise the procureurs, or juges d'instruction act or appoint deputies to act for them. His "proof" is signed by the officer, though he need not write it, and has at

least the effects of a rule *nisi*. It is a summary of evidence as well as evidence. In this stage (c) the policeman has passed from administrator—through two chrysalis stages (a) and (b)—into a full-fledged member of the judicial police; (d) *Trial*, as a rule takes place before the juge de paix, or mayor, sitting as "juge de police," in the case of offences, proof and trial often take place at the same sitting, before the juge d'instruction in the case of minor crimes, before the assize courts in the case of major crimes. Although the "juge" thus suffers a further metamorphosis from public prosecutor into judge, these two functions must be represented by different persons in any one cause. (e) Some questions, e.g. financial assessments and some offences, e.g. public nuisances which require an order for removal, or for payment for removal, never come before any court, but the administration makes and vindicates the law. (f) *Civil process* is as a rule kept distinct, but keepers are made bailiffs of fruit, etc.

The police subordinates are quick-change artists—inspectors and detectives, servants of home office and the court, accusers, judges, soldiers—anything and everything by turns on a small scale. [F. Brayer, *Dictionnaire Général de la police administrative et judiciaire*.—M. Block, *Dictionnaire Général de l'Administration Française*.—G. Meyer, *Lehrbuch des Verwaltungs-Rechts*, 1893.—A. ### POLITICAL ECONOMY.

Political Economy and Science—I. Scope, p. 128. II. Method, p. 138. III. Ethics, p. 137. IV. Political Economy, Applications of Logical Conceptions to, p. 139. V. Political Economy and Psychology, p. 140. VI. Political Economy, Recent Developments of, p. 143. VII. Political Economy, Postulates of, p. 148. VIII. Political Economy, Authorities on, p. 149.

It is not intended in this article to give a summary of the descriptions and theories that are now commonly found in treatises on political economy; since such a summary, considering the extent and variety of the questions which the subject is generally held to include, and the fulness of treatment which has now become customary, could hardly be more than a dry and uninteresting table of contents. What is proposed here is rather a brief discussion of the scope and method of the study, sufficient to indicate clearly the points at which controversies arise; and, without deciding dogmatically any questions of importance on which competent thinkers are still disagreed, to contribute, if possible, to the exclusion of disputes arising from mere misunderstanding, narrowness of view, or confusion of thought.

I. SCOPE. The first thing is to define the subject of inquiry. This task is rendered a little difficult by the important changes that have taken place in the meaning—of the

term "political economy," as used by leading writers, since it was first employed to denote the subject of a systematic treatise. Originally political economy was—as its name suggests—conceived to be the common portion of two arts, "economy in general" and the art of government. "Economy in general" was the art of regulating the employment of a family, or other group of human beings, so as to provide for all the wants of its members with prudence and frugality. "Political economy," accordingly, was conceived as the same art in its application to the group of human beings forming a political society or state. It was thus concerned with what was regarded as the chief domestic business of a statesman, whose aim should be, like a good father of a family, to provide everything necessary for supplying the wants of the society and its members, and to regulate the employment of the latter with a view to this end; due regard being had to the spirit, manners, habits, and customs of his people, and, in a free country, to their constitutional rights and liberties. This is (*e.g.*) the account of the subject given by Sir James STEUART in his treatise (*An Inquiry into the Principles of Political Economy*), published in 1767, nine years before the *Wealth of Nations*. Before the close, indeed, of the 18th century, a very different view of a statesman's duties, in relation to industry and trade, had begun to be widely taken, under the influence first of the PHYSIOCRATS (*q.v.*), and afterwards of Adam SMITH. Still, notwithstanding this fundamental change of opinion as to the maxims of economic policy, the current conception of political economy as a branch of the art of government is definitely retained by Adam Smith. "Political economy," he says, "proposes two distinct objects; first to provide a plentiful revenue or subsistence for the people, or more properly, to enable them to provide a revenue or subsistence for themselves; and secondly, to supply the state or common weal with a revenue sufficient for the public service. It proposes to enrich both the people and the sovereign." This definition, however, of the scope of the study is not given till the commencement of the fourth book of the *Wealth of Nations*: the first two books are occupied in expounding the "causes of the improvement" which the power of civilisation brings about "in the productive powers" of a nation's labour—independently of the fostering care of government; the "order according to which this produce is naturally distributed among the different ranks and conditions of men in the society"; and, in particular, the effects of the accumulation of capital, and of the different forms which capital "naturally" assumes. It is on the basis of this analysis of the "natural" process of production, distribution, and exchange of wealth that Adam Smith proceeds

to frame, in the fourth book, his elaborate indictment of all endeavours of government, whether by special encouragements or special restrictions, to allot to a particular species of industry a greater or lesser share of the capital of the society than would naturally go to it. "All systems of either preference or restraint being thus completely taken away," the old conception of the art of political economy finds its main content withdrawn from it: the sovereign and the statesman are "completely discharged from the duty of superintending the industry of private people and of directing it towards the employments most suitable to the interests of the society." This being so, it is easy to understand how, under the influence of Adam Smith's epoch-making book, a new meaning was given to the old term "political economy": the study so called came to be viewed not as an investigation of the manner in which a statesman ought to regulate industry and trade, but of the manner in which industry and trade would regulate themselves if the statesman would only abstain from ill-advised meddling. Political economy, in short, came to be conceived—if we may apply a distinction that was not used with precision till later—as a part of the science of human society, rather than a part of the art of government; the guidance which the science had to give to government being, apart from questions of taxation, mainly summed up in the simple phrase "Hands off!" The sovereign was, indeed, left with the very important duties of guarding the community against invasion from without and maintaining an exact administration of justice within it; but, indispensable as these functions clearly were to the well-being of industry and commerce, it was not held to be within the purview of political economy to lay down principles for their discharge.

This changed view of the scope of the study soon found clear and distinct expression in the writings of the disciples of Adam Smith. In the influential systematic treatise of J. B. SAY (1803) political economy is defined simply as "the science which treats of wealth"; and Government is merely viewed as a great consumer, whose needs have to be supplied by taxes and loans. Similarly, the very title of RICARDO's epoch-making work, *Principles of Political Economy and Taxation*, seems to imply that the only legitimate function of government which he discusses—taxation—is hardly regarded by him as strictly belonging to "political economy." It is true that, so late as 1821, James MILL began his *Elements of Political Economy* with the old comparison:—"Political economy," he says, "is to the state what domestic economy is to the family": . . . and just as "the art of him who manages a family consists in regulating the supply or consumption of those things which cannot be

produced but with cost," so "the same is the case with political economy." But, at the same time, the declared aim of his treatise is only "to ascertain the laws,"—meaning laws of nature, not laws of man,—which regulate the production, distribution, exchange, and consumption of commodities that cannot be obtained without human labour: that is, James Mill introduces the subject as an art, and then proceeds to announce that it will be treated as a science. With more clearness of view, N. W. SENIOR, in 1837, saw the necessity of dividing the "science of political economy" into two great branches: (1) the theoretical, which "explains the nature, production, and distribution of wealth"; and (2) the practical, of which the office is to "ascertain what institutions are most favourable to wealth." And some years later, in a compendious treatise on political economy, as a "pure science" (written originally for the *Encyclopedia Metropolitana*), SENIOR, with a consciousness that he was narrowing the traditional meaning of the term, proposed to confine the name of political economy to the theoretical branch of the subject; leaving the practical branch to be absorbed in the general art of government. As this view of the scope of the study became, on the whole, the prevalent view among English economists, it may be convenient to examine briefly the arguments by which Senior justifies the innovation. He begins by fully recognising the importance of the questions which the practical branch of political economy, as previously conceived, attempts to answer. Inquiries, he says, as to the means by which the industry of man may be rendered more productive by the action of government, the distribution of wealth most desirable in a given state of society, the means by which any given country may facilitate such a distribution—such inquiries are undoubtedly of great interest. But they "no more form part of the science of political economy than navigation forms part of the science of astronomy. The principles supplied by political economy are indeed necessary elements in their solution, but they are not the only or even the most important elements. . . . They involve, as their general premises, the consideration of the whole theory of morals of government, and of civil and criminal legislation; and for their particular premises, a knowledge of all the facts which affect the community which the economist proposes to influence." The statesman, he explains, who has practically to solve these questions, must consider all the causes which may promote or impede the general welfare of the society for which he proposes to legislate; the political economist, whose systematic attention has been concentrated on wealth, "has considered only one, though the most important, of those

causes": accordingly his scientific conclusions, however true, "do not authorise him in adding a single syllable of advice." His business as a political economist "is neither to recommend nor to dissuade, but to state general principles which it is fatal to neglect, but neither advisable nor perhaps practicable to use as the sole or even the principal guides in the conduct of affairs." Substantially the same view was expressly adopted by J. S. MILL, though the plan of his popular and influential *Principles of Political Economy* is not framed in accordance with it. With characteristic eclecticism, while he includes in his treatise a discussion of the questions of the old art of political economy—even with some startling enlargements—he does not introduce these discussions as belonging to political economy strictly: but as mingling political economy with social philosophy. The same view was also effectively expounded, some years later, by J. E. CAIRNES in his *Lectures on the Character and Logical Method of Political Economy*, with still more pronounced antagonism to the older view than even Senior had shown. "Political economy," says Cairnes, "stands neutral between competing social schemes, as the science of mechanics stands neutral between competing plans of railway construction, as chemistry stands neutral between competing plans of sanitary improvement": it has, accordingly, "nothing to do with *laissez faire*." And since Cairnes, the majority of English writers who have regarded political economy as a scientific study have taken substantially the same view of its scope.

There is no doubt much force in the arguments of these writers, so far as they tend to the conclusion that the art of political economy, according to Adam Smith's use of the term, cannot be completely separated from the general art of government. It is certainly true that in deciding practical questions of public finance—or of governmental action, in matters of industry and trade, on other than financial grounds—it is often necessary to take into account other considerations besides the effects of the proposed measures on the production and distribution of wealth; and that sometimes these other considerations are more important than those with which political economy is concerned. But to refuse therefore to recognise an art of political economy at all, even as a partially distinct branch of a larger whole, was a more drastic measure than these arguments justified; and it was certainly exposed to the drawbacks involved in any attempt to change the long-established meaning of a familiar term. To tell the readers of Adam Smith—for the *Wealth of Nations* has never ceased to be widely read—that "political economy has nothing to do with *laissez faire*," was too daring a paradox; and it certainly has not been very

successful in dispelling the popular confusion between theory and practice which it was intended to clear away. The "laws of political economy" are still liable to be "disobeyed" in the ordinary discourse even of well-educated persons; indeed in 1888, an eminent judge (Lord Bramwell), presiding over the economic section of the British Association at Bath, enunciated with confident brevity the old-fashioned view of the subject. "What will be the best way to add to the wealth of a society must be a subject of study by that society, which will lay down rules—that is make laws—for the purpose; and this is political economy. Adam Smith was not the first political economist, though well called the father of those rules which now prevail. But rules for the purpose existed before him, the great objection to them being that most of them were wrong. There was a law that the dead should be buried in woollen . . . laws were made for fixing wages . . . laws against regrating and forestalling . . . usury laws . . . you cannot deny that there were economical laws because you think them wrong." There can be no doubt that the interest of Adam Smith's book for ordinary readers is largely due to the decisiveness with which he offers to statesmen the kind of practical counsels which, according to Senior and Cairnes, he ought carefully to have abstained from giving; perhaps therefore, in view of long-established usage, it will be found more easy to avoid any confusion between "laws of nature" and "laws of human legislation" in relation to the production and distribution of wealth, if we grant the study of both a place within the pale of political economy, while carefully distinguishing the science or theoretical branch of the subject from the art or practical branch.

And this conclusion will receive further support if we see reason to regard the science of political economy as only a partially distinct branch of the general science of society, just as the art is only a partially distinct branch of the general art of government. This, no doubt, was not the view taken by Senior, Cairnes, and their followers. According to the former, while the sciences which supply the rational basis for the art of government have premises drawn from an infinite variety of phenomena, the premises of the science of political economy consist of a very few general propositions; from which, as he holds, the political economist can draw conclusions universally true in respect of the production of wealth, and as regards its distribution, can at any rate "lay down the natural state of things as a general rule," without turning his attention to any elements of social life beyond the process of producing and exchanging wealth. The scientific value of such deductive reason-

ings will be considered later; what we have now to observe—a point apparently overlooked by Senior and Cairnes—is that the practical arguments in favour of the "system of natural liberty," urged by Adam Smith and his successors, may similarly be presented as deductions from a few premises, representing familiar facts of human experience and not requiring any wide study of social phenomena. Thus it may be argued, first, that from the universality of the desire for wealth, the superior opportunities that each individual has—as compared with any other person—of learning what conduces best to the satisfaction of his wants, and the keener concern he has for such satisfaction, any sane adult may be expected to discover and aim at his own economic interests better than government will do this for him. Then, this being granted, it may be argued secondly that consumers in general—*i.e.* the members of the community generally in the character of consumers—seeking each his own interest intelligently, will cause an effectual demand for different kinds of products and services, in proportion to their utility to society; while producers generally, seeking each his own interest intelligently, will be led to supply this demand in the most economic way, each one training himself or being trained by his parents for the most useful, and therefore best rewarded, services for which he is adapted. Then, keeping within the same narrow lines of analysis and deduction, we may show how in certain cases, such as that of industrial monopoly, the general argument for the coincidence of private interest with the interest of the community fails. All these arguments may be worked out in considerable detail, without touching on any social facts beyond those considered in the science delineated by Senior—the nature of wealth, the general causes of changes in the value of purchasable commodities, the universal desire to obtain such commodities at the least possible sacrifice, and the rational activities to which this desire may be assumed to prompt intelligent persons under various conditions.

It will be replied that this kind of general reasoning cannot by itself enable us to solve any of the practical problems of economic legislation; because such problems, as Cairnes says, often "present other aspects than the purely economical—political, moral, educational, artistic aspects;—and these may involve consequences so weighty as to turn the scale against purely economic solutions." In saying, however, that there are "few" practical problems which do not present extra-economical aspects, Cairnes seems to go too far; since there are certainly some important departments of economic legislation, *e.g.* banking and currency, in which a statesman would usually come to

his conclusions on purely economic grounds. Still no doubt his statement is largely true; even in matters of taxation and public finance, other than strictly economic aims have often to be taken into account,—for instance the actual plan of taxation in England is partly determined by the general conviction that alcoholic drinking is dangerous to health and morals. But, granting that *effects* not strictly economic have to be taken into account in some of the concrete problems belonging to the practical branch of political economy, it is no less true that in some of the concrete problems of economic science *causes* not strictly economic cannot be overlooked. Suppose, for instance—to take the leading question of the *Wealth of Nations*,—we compare the productiveness of the labours of one country at the present time with that of another, or with the productiveness of its own labour at an earlier period—there is no one of the extra-economical elements of social life mentioned by Cairnes which may not come into consideration; political systems, moral opinions and habits, educational methods, artistic faculties and tastes, each in turn may become important. And no general rule can be laid down as to the extent to which these other elements are to be taken into account; since their relations to industry and trade vary indefinitely in closeness and importance in different economic inquiries.

The difficulty of completely separating the science of political economy from the general science of society may be illustrated by examining more closely the definition of the social relations and activities with which political economy is primarily concerned. From Adam Smith downwards they have been commonly conceived as activities and relations connected with wealth; and by writers of this century have usually been classed under the four heads—Production, Distribution, Exchange, and Consumption; or under three of the four, one or other of the last two being often omitted as a separate head. This division of subjects is perhaps a little confusing, as it is partly understood to represent a division of processes; the machinery of exchange—bills, currency, banking—being commonly treated under the third head. But when wealth is said to be “produced” by human labour, it is not matter that is brought into existence but some adaptation of external matter to human needs and desires; and this adaptation is carried on through the whole process of conveyance and exchange, until the “product” passes into the consumers’ possession and political economy hands it over to domestic economy. So again Distribution—the division of the produce into the shares distinguished as wages, rent, interest, profit—is mainly performed through Exchange, so far as it is an actual and not merely ideal division. But when we look

closer at the facts denoted by these two latter terms, we see that what is distributed through exchange in modern communities is not merely the aggregate of material commodities which we commonly call the “produce” of labour; but also the services of professional persons—physicians, lawyers, ministers of religion, educators, actors, etc.—whose labour is not spent in adapting external matter to human needs and desires, but in ministering to those needs and desires in some other way. Now, if the political economist were to extend his inquiries to the causes which render the supply of medical, legal, educational, ecclesiastical, and dramatic services more ample or better in quality in one age and country than in another, his science could hardly be prevented from becoming almost coextensive with the general science of society; especially if he also included governmental services, which in modern communities are mostly paid, and may legitimately be regarded as obtained by the public in exchange for part of the proceeds of the taxes. This extension of the subject is avoided, in treating the topic of Production, by confining attention primarily to the application of human labour to external matter; and only, under this head, taking note of educational or medical services, or the activities connected with the administration of justice, so far as they have an important bearing on the efficiency of industry in the narrower sense. But from the point of view of Distribution and Exchange a somewhat wider survey is properly taken; as the economic aspect of other social activities—at any rate so far as their remuneration is determined by competition and free contract—cannot be excluded from consideration without obvious incompleteness. For instance, in investigating the causes that determine the amount of employers’ profits, the competition of the professions with business for men of ability is an element that cannot be ignored.

To sum up: Political economy, as commonly studied, has included a theoretical and a practical branch, which it is important to distinguish clearly, since there is a popular disposition to confound their respective premises and conclusions. For brevity, it seems convenient to refer to them as the science and the art of political economy; the latter being historically the subject to which the term was mainly applied in its earlier use, whereas among English political economists of the present century there has been a tendency to restrict it to the former. The science of political economy deals with a certain class of social activities and relations, the study of which can with advantage be partially separated from the study of the rest; but the separation is only partial, most other social activities having, as competitively remunerated, an economic aspect, as well as

more or less influence on the activities with which political economy is more specially concerned. The degree of separation between the science of political economy and the general science of society it is well to leave somewhat indefinite, partly because it differs importantly in different inquiries, partly because the general science of society is at present in a rudimentary condition and struggling towards a fuller development,—each step in which is not unlikely to alter somewhat its actual relations to the special sciences which are, ideally speaking, its branches.

Similarly the art of political economy, which deals with a special department of governmental interference, designed to improve either the social production of wealth or its distribution, may be partially, but only partially, separated from the general art of legislation or government. Here, again, the degree of separation varies considerably according to the nature of the problems considered; but on the whole the connection of the art with the more comprehensive art of which it is a part is closer than the corresponding connection in the case of the science. This is partly due to the fact that the general art of government, though its development is not very advanced, has hitherto received considerably more attention than the general science of society.

H. S.

II. METHOD. In the discussion of the scope of political economy we have had to anticipate in some measure the discussion of its method, since the two questions cannot be altogether separated. We now pass to concentrate attention on the latter question, on which express differences of opinion have been more strongly accentuated. Whether the method of political economy is "inductive" or "deductive," and if inductive, how far it is "historical," and whether so far as it is deductive it is "hypothetical" or "positive," and to what extent its more exact reasonings ought to assume a mathematical form—these questions have, in times not long past, given rise to prolonged and sometimes bitter controversy. The polemical treatment of them, however, in England at least, seems lately to have given way to a general prevalence of a more balanced and conciliatory view; and in fact the long sustinment of the controversy seems to have been partly due to misunderstandings and confusions, and partly to inadvertence in applying to the whole of the subject general statements that are only true of *some* of the reasonings included in it.

The most fundamental misunderstanding appears to have arisen from a confusion between the method of the science and the method of the art, as above distinguished. Two distinct propositions, one being important as a premise in the deductive reasonings of the science, the other in the *rational* of the leading

rules of the art, have been more or less blended together—under some such name as individualism or economic egoism—or at any rate regarded as logically inseparable, and forming part of one doctrine. Whereas in reality, though there is a certain affinity between them, there is no sort of logical connection; and though each of them is only true with important limitations and qualifications, the required limitations are quite different in the two cases. The *first* is the proposition, stated with varying amounts of qualification, that the "ECONOMIC MAN,"—i.e. the human being that political economy assumes to be normal—always prefers a greater apparent gain to a less, and prefers to attain any desired result with the least possible apparent loss or labour. The *second* is the proposition that the best possible result will be attained, so far at least as the production and distribution of wealth are concerned, if the individual is left free to regulate his own activities for the supply of his own wants, within the limits necessary to secure a like freedom to all other individuals. It is obvious that the second proposition does not follow from the first, since the economic individual may be deceived by appearances, or his interests may clash with the interests of the community. It is obvious too that they belong to entirely different departments of inquiry—the first gives information as to what happens, without pronouncing whether it is good or bad; the second judges that what happens or would happen under certain conditions is the best thing that could happen. Accordingly the first is important in explaining scientifically the facts of economic experience, but has nothing to do with economic ideals or rules of governmental action in economic matters; while the second leads immediately to a fundamental maxim of policy.

Let us for the present confine our attention to the science. Here the primary issue of importance is not whether the method of economic science is purely inductive or purely deductive; since the prevision characteristic of science necessarily involves some deduction, while the artificially simplified type of human action and social relations, with which deductive reasoning starts, is necessarily formed from observation and induction. The question is rather whether useful results are to be obtained by simple deduction from propositions—like the first of the two above given—generalised without laborious or systematic induction from familiar facts of ordinary experience. This is what the deductive economists contend; and perhaps we may say that the contention would never have been disputed if it had been limited to a certain class of questions, and not apparently put forward as a compendious account of the whole method of economic science. As so put forward, it is contradicted by the continual practice, and sometimes by the express

admissions, of the most deductive economists. It will always be found that the conclusions deductively obtained from premises of the kind above indicated are either (1) of a very general kind, chiefly valuable in a preliminary survey of economic activities; or (2) so far as they are more particular are merely abstract and hypothetical, requiring further knowledge only obtainable by induction before they can be effectively applied to the explanation of concrete facts.

To show this, it may be convenient to quote the "very few general propositions" which Senior, who is perhaps the clearest example in England of the extreme deductive view, regards as "*the premises*" of the political economist. They are these:

1. That every man desires to obtain additional wealth with as little sacrifice as possible.
2. That the population of the world is limited only by moral or physical evil, or by fear of a deficiency of those articles of wealth which the habits of the individuals of each class of its inhabitants lead them to require.
3. That the powers of labour, and of the other instruments which produce wealth, may be indefinitely increased by using their products as a means of further production.
4. That, agricultural skill remaining the same, additional labour employed on the land within a given district produces in general a less proportionate return; or, in other words, that though, with every increase of the labour bestowed, the aggregate return is increased, the increase in the return is not proportional to the increase of the labour.

Of these propositions, the second at any rate can hardly be maintained to be one "scarcely requiring proof or even formal statement"; since Senior himself in justifying it has to refer to the systematic observations by which it has been "ascertained that for considerable periods, and in extensive districts under temperate climates, the human race has doubled within twenty-five years." And only if the limits of increase are left quite vague can the third and fourth propositions be said to represent "familiar facts" included "within the previous knowledge of almost every man." Also the list is by no means exhaustive; it would not be possible to establish the most elementary minimum of conclusions that could be called a body of economic doctrine from these four propositions without several other assumptions:—*e.g.*, as to the law of property, contract and inheritance, as to the gradual satiation of the desire for any particular commodity as its supply increases, and as to the knowledge possessed by buyers and sellers in any exchange of the offers of other buyers and sellers of similar commodities. Still, speaking broadly, and omitting minor corrections, it may be granted that from a group

of assumptions similar in kind to Senior's, and representing like them facts of common experience, a general or typical account of the process of production and the determination of the shares of different classes of producers in a modern industrial community may be deductively worked out. Again it may be admitted that with the same general premises a number of hypothetical problems may be solved as to the economic application of capital, or the determination of prices, wages, interest, rent, on the assumption of a definite set of particular conditions, varying from case to case. And finally it cannot reasonably be denied that both kinds of deduction, those that are general and typical and those that are particular, precise, and hypothetical, are useful as a means of training the intellect for dealing with the complex detail of the questions presented by concrete economic facts. But when we turn to any of these concrete problems—when we try to explain, *e.g.* the changes in prices, general and particular, during the last twenty years, or the fall in the rate of interest, or the differences in the wages in the same employment in different parts of England, or the differences of wages or profits in different employments—it is at once evident that such deductions are not sufficient, and that further data are needed, only obtainable by systematic observation and induction. Indeed the least reflection on any of Senior's four propositions will at once show the need of such further data. Let us take the first, "That every man desires to obtain additional wealth with as little sacrifice as possible." We can infer from this that, *other things being equal*, our "economic man" will prefer a greater gain to a less, in any sale of his services or of material commodities owned by him. But till we know what he regards as "sacrifices" and how he quantitatively compares different kinds of sacrifice with each other and with the prospect of additional wealth, we cannot get much further; and Senior himself dwells on the "diversity" that "exists in the amount and the kind of the sacrifice which different individuals will encounter in the pursuit of wealth." . . . "These differences," he goes on to say, "form some of the principal distinctions in individual and national character." But if so, we require to learn from observation and induction how different nations, or different classes of men in the same nation, estimate different kinds of sacrifice, before we can explain (*e.g.*) how wages and profits vary in different employments—"with the care and hardship, the cleanliness and dirtiness, the honourableness and dishonourableness of the employment," as Adam Smith expresses it. And a little reflection will show that in this consideration of "sacrifice" we must include all the varied motives, higher and lower, that are actually found to conflict

with the desire of pecuniary gain—patriotism, *esprit de corps*, the unconscious influence of habit, conscious regard for custom or class prejudice, the love of independence, the love of country life, the taste for town amusements, regard for health, philanthropy, and many more. Even the “aversion to labour” which some economists have paralleled to the “desire of wealth,” cannot be treated as a uniform force, operative equally in all human beings at all times; nor, indeed, as Senior himself admits, can the desire of wealth itself be so treated. Our estimates of the force of all these motives, if they are to have any scientific value, must be formed on the basis of the most careful observation and systematic induction. The same is true of the conditions of knowledge—which Senior, as we saw, does not expressly notice. For instance, granting that in a perfectly organised market, in which the rates of all exchanges may be easily ascertained, the price of similar commodities will be approximately the same at the same time, allowing for cost of conveyance; it remains true that we can only learn by observation and induction, how far the conditions of mutual knowledge, in the case of the buyers and sellers of any particular commodity, actually approximates to those of a perfectly organised market.

And on many other points of fundamental importance,—such as the standard of comfort of different classes and its degree of stability, the conditions under which increased remuneration tends to increase the efficiency of labour, the extent to which population is limited by prudence or by insanitary conditions, the influence of scarcity, whether of materials or skilled labour, on the cost of production, the degree in which monopoly, whether due to combination or otherwise, limits the effects of open competition—on all these points deductions from familiar facts of ordinary knowledge can obviously give but very imperfect guidance towards the solution of real problems.

Almost everywhere, in short, in dealing with particular concrete questions of political economy, systematic induction is needed for the exactest possible determination of data, as well as for the verification of conclusions.

In declaring that the method of political economy, regarded as a concrete science, is necessarily to a great extent inductive, we also declare that it is necessarily historical, in a wide sense of the term; the facts of which it seeks to ascertain the empirical laws, in order to penetrate their causal connexions, are facts that belong to the history of human societies. The question can only be how far the history studied is recent or remote. Here, *prima facie*, we should distinguish provinces rather than methods of inquiry. There can be no doubt that the whole history of human society presents economic phenomena, the investigation of which,

with a view to the ascertainment of their causes and effects, is a legitimate subject of scientific curiosity; the economic historian, so far as he is scientific, is obviously studying a branch of economic science. The only points on which controversy can arise are (1) how far the knowledge of recent economic history, or the methods useful in obtaining such knowledge, are necessary or useful for the study of remote economic history; and (2) conversely, how far the study of remote economic history tends to throw light on the problems of the present and the recent past.

On the former question an attractive *modus vivendi* between the extreme historical school and the deductive economists is proposed in BAGEHOT's (posthumously published) *Economic Studies* (1880). According to this brilliant and penetrating writer “English political economy—the abstract science outlined by Adam Smith and constructed by Ricardo”—is “only applicable to a limited and peculiar world”; it may be defined as “the science of business,” such as business is in societies of “grown-up competitive” production and trade; a “theory of commerce, as commerce tends to be more and more when capital increases and commerce grows.” It certainly seems clear that elaborate deductive reasonings, based on the easy transferability of labour and capital from place to place and from employment to employment, are primarily applicable only to such advanced societies as Bagehot has in view; and are only useful—if at all—as a preliminary intellectual exercise to the economic historian who is concerned with less advanced communities. But this hardly justifies us in adopting the sharp distinction proposed by Bagehot between an “economic” and a “pre-economic” era; or at any rate a thoroughly “pre-economic” society may with almost equal justice be called “pre-historic.” Any society that has a “history,” in the ordinary sense, has arrived at the stage of development at which the analysis that economic science offers of the fundamental notions of utility, value, wealth, capital, money, of the varying remuneration of employment of man's labour on his physical environment, and of the general laws determining competitive exchanges, must be at any rate partially applicable to it.

However, it belongs rather to the historian than the economist, according to the ordinarily recognised division of intellectual labour, to decide how far this general analysis, or any abstract reasoning based on it, is useful for his inquiries. But it may be worth while to point out to the more aggressive “historicists” that the more the historian establishes the independence of his own study,—by bringing into clear view the great differences between the economic conditions with which we are familiar and those of earlier ages—the more, *prima facie*, he tends

to establish the corresponding independence of the economic science which, pursued with a view to practice, is primarily concerned to understand the present. The more effectively, *e.g.*, he proves that modern economic analysis, and deductions based on the assumption of free competition and mobility of labour, are inapplicable to the study of mediæval history, the more improbable he makes it that the study of mediæval history has any important light to throw on the economic problems of modern communities in the most advanced stage of development.

Taking now the point of view of the economist whose primary task is to understand the phenomena of his own age, we may perhaps reduce the area of controversy by pointing out that the question, how far knowledge of the past is important for a scientific grasp of the present, will naturally receive a different answer in relation to different inquiries. In the first place, it may be noted that some economic propositions—usually of a general and elementary kind—while true in all stages of economic development, still find their most impressive verifications in stages antecedent to our own. For instance, the effect on price of a deficiency in the supply of a necessary of life, which modern cosmopolitan commerce tends to confine within narrow limits, is most strikingly manifested by the dearths of the middle ages. So again, the great epidemics of the same period, especially the so-called Black Death, similarly illustrate the power of a deficiency in the supply of labour to raise its value; and the latter example is all the more interesting because of the barriers of law and custom through which competition had to force its way. Even in dealing with modern questions of a more special kind, the most impressive evidence may often be obtained by a retrospect considerably extended, though not usually so far as in the cases just mentioned. Thus it may be hoped that no modern state may again give such an object lesson in the dangers of an inconvertible paper currency as both France and North America provided in the last quarter of the 18th century; and it may be hoped also that the English student will always have to turn to the first quarter of the 19th for a full exhibition, in his own history, of the evils of an unguarded legal right to poor-relief.

The instances above given are all useful to the student of the economics of advanced communities. But human societies are actually coexisting in different stages of economic development; and concrete economic science, even if pursued with practical ends, cannot exclude from its view the economic phenomena of the less advanced; and for these, instructive analogies are still more likely to be obtained from the past history of societies now in the

latest stage. Thus competent judges hold that it might have prevented serious mistakes in our government of India, if the governing statesmen had had before their minds the historical development of land-tenure, as we now conceive it to have taken place in European countries.

So far we have considered the relation of the science of political economy to economic history regarded as a special branch of the whole historical study of human society,—a branch which, in the division of intellectual labour that the progress of knowledge renders increasingly necessary, has, in the last generation, attained a degree of practical independence resembling that of (*e.g.*) ecclesiastical history. But some of those who, throughout this century, have from time to time announced the proximate triumph of history over the old-fashioned political economy, have rather had in view the general study of human society as a whole, treated historically, as the study of a process of development. It is held that a scientific knowledge of the fundamental laws of this development will enable us to predict in outline the future history of society; and that such a general forecast must be more reliable, even as regards future economic conditions, than any predictions founded on a study of economic phenomena alone. There is much to be said for this contention, on the supposition that adequate scientific knowledge of social development has been attained. But in the present condition of the general science of society, the controversy between sociologists and economists is rather like certain disputes between European nations for the possession of African territory; since it does not seem to relate to any region effectively occupied and cultivated by either science, but to a far-reaching "hinterland" which it is hoped to occupy and cultivate hereafter.

In considering the relation of political economy to history we view it as a concrete science, concerned with the explanation of actual economic facts; when we turn to the question how far its method is properly mathematical, our attention is chiefly directed to the abstract deductive reasonings employed in such explanations. This question was brought into special prominence<sup>1</sup> for English students of the science by the emphatic affirmation of JEVONS, in his highly original and important *Theory of Political Economy* (1871), that "economics, if it is to be a science at all, must be a mathematical science." In a certain sense the affirmation is incontrovertible, since a main aim of economic

<sup>1</sup> The earliest systematic application by an Englishman of mathematic symbols to political economy would seem to be WREWELL's mathematical exposition of some doctrines of political economy in the *Cambridge Philosophical Transactions*, vol. iii. pp. 191-230.

science is to determine the relations of varying quantities—*e.g.* to ascertain how the increase of the quantity of capital in a country affects the rent of land and the wages of labour, how changes in the quantity of a commodity demanded at a given price affect its actual price, etc. The only disputable point is how far it is necessary or expedient to represent these quantitative relations by mathematical symbols or diagrams. The answer must obviously vary to a great extent with the complexity of the reasoning to be represented. Some quantitative deductions are so simple that it would be pedantic to express them otherwise than in ordinary English; some are so elaborate that it would be a *tour de force* to follow them without the aid of the technical language of mathematicians. Between the two comes an intermediate class of reasonings for which the use of mathematical symbols or diagrams is certainly not indispensable, and, while most convenient for persons who have had a mathematical training, is troublesome to those who have not been so trained. Those economists who, while giving an important place to the deductive method, decline to adopt a formally mathematical treatment of economic problems, would seem to be of opinion that the deductions really useful, in the present state of our empirical knowledge, fall within this intermediate class in respect of elaborateness and complexity.

What has been said of the method of economic science will, to a great extent, apply equally to the art of political economy; since the reasonings of art are substantially the same as the reasonings of science, so far as the selection of means for the attainment of the ends of art are concerned; they only differ in arrangement and form. The case is different when we attempt to determine the ends at which political economy, regarded as an art, does or ought to aim. On this point, however, there has not been much express discussion, among English economists at least, owing to their full—and even too sweeping—recognition of the subordination of the art of political economy to the wider art of government of which it is a branch. We may trace, however, in the history of economic ideas, a gradual important change in the general conception of the ends which government ought to have in view, in legislation or other interference primarily designed to produce effects on the wealth of the community. The oldest view of political economy conceived it mainly as a part of the art of public finance; its object was to make the people as rich as possible, in order that the funds required by government might be attained as amply and as easily as possible. And these two objects—the provision of revenue or subsistence for the people, and the provision of revenue for government—are retained, as we have seen, in Adam Smith's definition of the study; only by this time the first object has

come to be conceived as independent of, and prior to, the second. In Adam Smith's view, of course, the first object would, in the main, be best attained by the "obvious and simple system of natural liberty"; and we have noticed how the triumph of this view turned the minds of economists from the point of view of art to that of science, and led them to regard the investigation of the natural process of social production and distribution as their main business. Still, in defining the object of political economy, the improvement of this process is stated as a practical end; only, for half a century after Adam Smith, it is usually the improvement of production rather than distribution that is so regarded. This is strikingly manifested, *e.g.* by J. R. McCULLOCH in his statement of the practical aims of political economy. "Its object," he says, "is to point out the means by which the industry of man may be rendered most productive of wealth, to ascertain the circumstances most favourable to its accumulation, *the proportions in which it is divided*, and the mode in which it may be most advantageously consumed." Here one would almost say that the natural structure of the sentence is deliberately broken, in order to exclude the idea of seeking the improvement of distribution. But even before McCulloch wrote this the attention of thoughtful men had been strongly drawn to the shortcomings of the "system of natural liberty," regarded from the point of view of distribution. In Senior's *Introductory Lecture to the University of Oxford* in 1826, we note an important change of tone. He even goes the length of saying that "diffusion of wealth," such that "all the necessities and some of the conveniences of life may be secured" to the labouring class, "*alone entitles a people to be called rich.*" Then in J. S. Mill's treatise, written about twenty years later, the interest in the improvement of distribution had become so strong as to give the predominant tone to the book; and the most radical proposals of economic change, with a view to the more satisfactory diffusion of wealth, were discussed with sympathy and partial agreement. Finally, in the latter half of the century—largely through the influence of Mill's remarkably persuasive work—the original predominance of production over distribution, in the current view of the art of political economy, has been almost inverted, and the aim of improving distribution has become continually more prominent in the minds of most of those who study political economy with a practical object. H. S.

III. POLITICAL ECONOMY AND ETHICS. The growing importance of distribution as a practical problem has led to an increasing mutual interpenetration of economic and ethical ideas, which, in the development of economic doctrine during the last century and a half,

has taken various forms. It is an ethical postulate that the distribution of wealth, in a well-ordered state, should aim at realising political justice; hence arises a need of showing that the ideal of distribution which political economy—regarded as a branch of the art of government—puts forward, is in harmony with justice. This task was not expressly undertaken by Adam Smith or his leading English successors. But it had been undertaken by the most philosophical writer among the *PHYSIOCRATS* (*q.v.*) namely, by LE MERCIER DE LA RIVIERE, in his *Ordre naturel et essentiel des sociétés politiques*. Political justice, he argues, lies in the recognition, application, and enforcement, by sovereign and magistrates, of the simple natural laws which the Creator has established for the ordering of human society: that is—so far as the distribution of wealth is concerned—in securing to every man personal liberty, and the unfettered control and use, including alienation, of the material things which his labour adapts to his needs. And, from the age of the physiocrats to the present day, the impartial maintenance and enforcement of this “obvious and simple system of natural liberty”<sup>1</sup> has been defended by a long line of individualistic thinkers, as constituting the essence of distributive justice. In the popular conception of this ideal, the notions of “liberty” and “property” are usually kept distinct: but the system attains completer unity if in accordance with the contention of philosophical individualists, the rights of property are regarded as a simple application of the principle of liberty, and all the natural rights of men summed up in the single right to equal freedom.

As an interpretation, however, of the popular conception of ideal justice, the bare notion of Freedom was palpably inadequate: it was necessary to show further that the distribution of wealth resulting from complete industrial liberty was in accordance with Desert, and tended to give each individual engaged in industry and trade the just or “fair” remuneration for his services. It is here that the progress of economic knowledge has most clearly influenced common morality; and the influence has extended beyond the sphere of governmental action, to private morality in matters of distribution and exchange. For “fair” wages and prices in the prevalent morality of preceding ages were vaguely understood to be wages and prices corresponding to the “intrinsic worth” of the respective services and commodities: but political economy, showing the ordinary estimate of “intrinsic worth” to be chiefly determined by shifting custom, exhibited the need of some other interpretation of fairness, recognising the normal operation of supply and demand on rates of exchange. So far as it has attempted to supply this need, the teaching of political

economists has generally pointed to the conclusion that a “free” exchange without fraud or coercion is also a “fair” exchange. It is, however, doubtful how far this interpretation has ever satisfied the common moral consciousness, when cases are considered in which one party to the exchange is found profiting by the ignorance or distress of the other. At any rate it has been widely maintained that a strictly competitive exchange does not tend to be really “fair”—some say “cannot be really free”—when one of the parties is under pressure of urgent need; and further, that the inequality of opportunity which private property involves cannot be fully justified on the principle of maintaining equal freedom, and leads in fact to grave social injustice. To this view of justice or equity, the socialistic contention—that labour can only receive its due reward if land and other instruments of production are taken into public ownership, and education of all kinds gratuitously provided by government—has powerfully appealed; and many who are not socialists, nor ignorant of economic science, have been led by it to give some welcome to the notion that the ideally “fair” price of a productive service is a price at least rendering possible the maintenance of the producers and their families in a condition of health and industrial efficiency.

In the controversy between *INDIVIDUALISM* and *SOCIALISM*, which has been increasingly active during the last thirty years, the duty of preventing, so far as possible, undeserved poverty, has naturally become prominent. This leads us to notice the influence of political economy on the popular conception of Benevolence as a duty. Such influence has naturally varied considerably with variations in the general belief as to the beneficent effects of free competition. But we may say generally that the wider view of consequences which political economy has opened up, has tended, among educated persons, to check the old unqualified approval of so-called “charity,” and has even led to a tolerably wide-spread condemnation of indiscriminate almsgiving and other kinds of philanthropic encouragement of improvidence. On the other hand it has also exposed the fallacy of the old comfortable view that the luxurious consumption of the rich is indispensable in order to provide the poor with work and wages; and, on the whole, it has rather operated in the direction of making the philanthropic redistribution of wealth more circumspect and methodical, than of counteracting the movement to extend its scope, which the growth of sympathy and intelligence in modern civilised societies tends to cause.

So far we have briefly considered the relation of ethics to political economy regarded as an art or a practical study. It should be noted, in conclusion, that economic science, in

<sup>1</sup> Adam Smith, *W. of N.*, bk. iv. ch. ix.

investigating the causal connections of economic phenomena, is concerned in quite a different manner with morality. It has to consider how far, and in what ways, man in civilised societies is actually influenced by ethical considerations in the application of his labour to his material environment, and in dealing with the complicated system of exchanges by which the produce of that labour is distributed. In the deductive reasonings which play an important part in economic method—a part differently defined and estimated by different schools—it is to a great extent convenient to abstract the disturbing influence of ethical motives, so far as they restrain or modify the impulses that prompt a man to make the best bargain he can for himself in any transfer of commodities. This influence may generally be neglected in a certain class of concrete problems also—as in investigating the value of money, or the foreign exchanges. But in other cases—e.g. in the determination of wages—motives of this kind constitute an important factor; and in the development of political economy during the present century we may trace, in the works of our leading writers, a growing recognition of their importance. H. S.

IV. POLITICAL ECONOMY, APPLICATIONS OF LOGICAL CONCEPTIONS TO. Most of the ideas and principles employed in economic investigation have been borrowed from other sciences in which their use is justified by the special characteristics of those sciences. But many of these very general conceptions have to be specially modified when applied to the explanation of industrial phenomena. We may specially consider a group of ideas represented by the terms law, normal, tendency, average, force, cause. We find even in ADAM SMITH some traces of a certain confusion, more or less prevalent in the 18th century, based on the conception of nature and natural law. The confusion appeared chiefly in the method of investigating the study of human affairs. This was dominated by the presupposition that an elimination of the forms superimposed by man upon nature's handiwork would reveal a sort of residue or essence that could serve as a model for imitation and reconstruction. In this way the respective standpoints of science and of art, of positive and practical investigation, were blended in a theory which identified the hidden purposes of nature with the truest aims of man. That which was natural was taken as equivalent to that which was free from artificial interference; and this latter to that which ought to be. The LAWS OF POLITICAL ECONOMY (*q.v.*) thus tended to be alternately presented as something against which it was futile for society to contend, and again as something which it was imperative for society to promote. Political theory suggested a natural rate of wages, a natural rate of profits, as well as a natural right of property and a

natural right to labour. The confusion was, however, gradually dissipated as the provinces of science and of art came to be separated. With this distinction also the double meaning of *law*, which stands either for a *uniformity* or for a *precept*, was explicitly recognised. The term *law* is now almost universally applied in economics in the former sense. Thus an economic law is a specific regularity traceable in actual experience of industrial phenomena; and the confusion between scientific law and ethical law no longer prevails. In this connection the term *normal* has replaced the older word *natural*, and is used as an adjective correlative of *law*. We now read of *normal price* or of the *normal rate of wages*, and understand by the expression *normal* something which presents a certain empirical uniformity or regularity. Emphasis is thus laid on the principle that the usual and the desirable do not necessarily coincide; and that to leave nature to herself, so far as this may be conceived as possible in human affairs, does not necessarily conduce to the greatest social well-being. But in this modern use of the term *law* and its correlative *normal*, there still remains the possibility of misunderstanding and misapplication. The term *normal*, as prevailingly used in deductive economics, does not after all express what is actually found to happen in every case (see DEDUCTIVE METHOD). Of course the word is relative to some particular condition of society to which it explicitly or tacitly refers. But this is not all. It would only be verified in actual experience on a certain supposition, which is never exactly realised. Briefly, the *normal* is a more or less fictitious average. For example, the *normal price* is a price round which the actual prices fluctuate, and towards which, under the influences of competition, the actual price would more nearly approach as the period is lengthened, *provided that the general economic conditions remained stable during the period*. Not only can we not identify the *normal price* with any actual individual price, but we cannot properly identify it with the actual *average* of individual prices, except in so far as the hypothesis of stability of conditions is empirically realised. Estimates of *normal results* are, therefore, chiefly valuable for purposes of deductive exposition, and require various modifications before being applied to inductive explanation or prediction. A further consideration of the utmost importance introduces additional complexity, viz. that the periods for which the term *normal* applies differ considerably for different questions. For example, the *normal price* of a consumption good (see CONSUMERS' GOODS) refers to a period during which the number and efficiency of the working population, and the influences tending to keep up the investment of capital are relatively fixed; while the oscillations of price due

to changes of fashion, to variations of weather, to incidents of discovery, etc., are supposed to compensate for one another. But in determining the rates of wages and of interest themselves, with which the normal prices of commodities are connected, owing to the various ratios in which labour and capital may contribute to the production, a different set of questions is raised. In this case, we cannot lengthen our period in order to eliminate compensatory oscillations. For the general conditions of social development lead us to infer *progressive changes* in the conditions determining the value of productive agents. In these questions definite historical investigation, aided by estimates of various political and moral forces, takes the place of deductive calculations. The deductive method often rests upon mechanical and mathematical analogies; the inductive method, which here takes its place, rests rather upon biological and evolutionary analogies (see *INDUCTIVE METHOD*). The term *normal* ceases to apply, so far as it indicates an average, *estimated over a period of time*. But here it should be pointed out that the term *normal* may also be used to indicate a different kind of average, viz. an average estimated over a range of simultaneous phenomena. Whenever the result of a number of differently quantified phenomena can be calculated by *addition*, then it is useful to know their average value, from which their *aggregate* resultant is immediately found. For example, the total loss to consumers that would accrue from a tax on commodities could be roughly known, if we could estimate the average loss and the number of consumers. This example illustrates the important uses that may be made of the *average*. In these problems the theoretically deduced *normal* ought to coincide with the empirically inferred *average*.

A further implication of the term *normal* will be brought out by consideration of the allied term *tendency*. This term is based on mechanical analogies. It implies a force whose effect is modified by combination with the effects of other forces. The "law of the force," therefore, represents a "tendency" which can only be discovered by constructive analysis. Most of the laws of deductive economics are expressions of such tendencies. They can be applied to the interpretation of particular facts, only on the express proviso that *other things are equal*. For example, the law of *DIMINISHING RETURNS* points to an increase in cost of production of agricultural produce accompanying increase of population; but this tendency may be actually frustrated by improvements in the arts of production, etc. Similarly, the *LAW OF SUBSTITUTION* elaborated by Prof. Marshall (*Principles of Economics*, bk. v. ch. iii.) indicates a tendency towards the most economical mode of producing commodities, which is only realised on the assumption of sufficient foresight on the part of the leaders of industry.

Finally, we may refer to the particular form in which the general idea of *cause* has to be applied in economic deductions. The view of causation which has been popularly prevalent in economic expositions, may be called the *chain-view*. It is supposed that a causal series may be established thus: A determines B, B determines C, C determines D, and so on. Thus controversy has arisen whether it is the *Cost of Production* or the taste of the consumers that determines price (see articles on *PRICE*); and again, whether it is the prevailing standard of comfort or the productive efficiency of any class of labourers which determines their rate of remuneration. In such cases, supposing that a controversy turns on whether A or B is the cause of C, it is further assumed that if it is A rather than B that determines C, then it must be C that determines B. For example, if we decide that the cost of production determines price, then we go on to infer that price determines demand, and so on. Now Professor Marshall has pointed out that the various elements of an economic condition of equilibrium do not, in this way, follow one another in a single causal chain; but that they all mutually determine one another by simultaneous interaction. Thus, neither the amount demanded nor the amount supplied are in general fixed independently of the other, but the price and amount at which the commodity is sold are jointly determined by the joint conditions of supply and demand. This conception of the nature of causal interaction controls the entire exposition of the problems of *DISTRIBUTION* and *EXCHANGE* in its modern form.

[Marshall, *Principles of Economics*, bk. i. ch. vi.]  
W. E. J.

V. *POLITICAL ECONOMY AND PSYCHOLOGY*. If political economy is the science of wealth, then it deals with efforts made by man to supply wants and satisfy desires. "Want," "effort," "desire," "satisfaction," are each and all psychic phenomena.

It would therefore appear that psychology must be to political economy—like the deity of Boethius—"path, motive, guide, original, and end."

Yet it is obvious that the political economist as such is not engaged in the establishment of the ultimate principles of psychology. He has not, for example, to investigate the nature of a concept, or determine the relation of the Will to the Reason. So far it is clearly true (cp. Keynes, *Scope and Method of Political Economy*, pp. 87, 88) that although the laws of the political economist "rest ultimately upon a psychological basis," he accepts psychological principles as his data rather than establishes them as his conclusions; unless indeed he should be compelled to make excursions into

the psychological field proper, because he does not find his premises sufficiently elaborated to his hand.

But this does not justify the reduction of the psychological factor of political economy to a level with the physical factor. Cairnes indeed (*Logical Method of Political Economy*, 2nd ed. pp. 37 and 38, quoted and apparently endorsed by Keynes, p. 85) instances the law of rent, and maintains that, in establishing this law, the economist no more undertakes to analyse the motives of self-interest which dictate the conduct of the landlord and the tenant than he undertakes to analyse the physical qualities of the soil which determine the law of decreasing returns. Now this is very true. The economist starts with both psychological and physical data, which he need not analyse, provided he has satisfied himself that they are true. But the difference is this, that whereas his data are partly physical and partly psychical, his *quesita* are, in the last resort, wholly psychical. For if the law of rent is anything, it is a formulating of the principles which we may expect to regulate the conduct of men, secured in certain possessions and privileges, actuated by certain motives, and in the presence of certain physical facts and laws. The laws of political economy then, being ultimately laws of human conduct, are psychical and not physical; and therefore psychology enters into political economy on something more than equal terms with physical science and technology.

It therefore seems clear that, although the economist, as such, is not concerned with the ultimate analysis of his psychological data, his *quesita* or conclusions are themselves of the order of psychic phenomena. But within the limits thus laid down there is still ample room for diversity of opinion. It may be contended that the economist has to receive, and test, his psychological and physical data alike, to deal with them by the universal methods of dialectic (*i.e.* inductive and deductive logic, or mathematics, if applicable), and then hand over his psychological results to the sociologist. Or it may be argued that political economy is largely, or even prevalently, *applied psychology*, so that the economist must from first to last realise that he is dealing with psychological phenomena, and must be guided throughout by psychological considerations. In that case the relation of psychology to economics will be as close as that of mathematics to mechanics, though not in all respects analogous to it.

It is easy to see that the controversy as to the inclusion or exclusion of CONSUMPTION as a separate and acknowledged division of political economy, has a decisive bearing upon this question. The whole theoretic study of consumption can be little else than the appli-

cation of the great psychological law of diminishing returns of satisfaction or relief to successive increments of commodity or service supplied to the same subject. To admit "consumption" then as a branch of political economy is to admit that applied psychology has its conspicuous place in the science. So that if we are justified in saying that the express study of "consumption" has now been definitively admitted as within the scope of political economy, we are thereby admitting psychological method, as well as psychological data and conclusions, as a part of the science; and the importance of dealing thus expressly with consumption and the psychological phenomena on which this branch of this study rests may be well shown by typical popular fallacies. For instance, there was no more common application of political economy a few decades back than the dictum that "what people want they will pay for," and that therefore all subsidising is a waste of effort, and is "against political economy." Here the datum is that if one and the same man wants A as much as he wants B, he will be willing to give as much for it, sooner than go without it. From this datum certain conclusions as to market values and the commercially wise direction of efforts and resources are reduced, and these in their turn are reinterpreted into the statement that if one of two men is unwilling to give as much for A as the other is willing to give for B, then the first man does not want A as much as the second wants B, and it would be a wasteful and mistaken philanthropy to supply No. 1 with A rather than No. 2 with B. Of course no economist would formulate such an absurdity, but if the economists exclude consumption from express and psychological treatment, they leave room for and almost invite such "applications."

So much then for "consumption." But EXCHANGE is so closely connected with consumption, and the laws of value are now seen to be so intimately dependent upon the psychological law of diminishing returns of satisfaction, that it must be impossible henceforth to exclude applied psychology from the problems of value and of exchange.

An excellent illustration is furnished by the problems of the currency. Of all branches of economic enquiry those that are concerned with MONEY and with FOREIGN EXCHANGES seem most nearly to approach the objectivity of natural phenomena; and what is known as the QUANTITY THEORY has been cited as a proof case of an economic law which is not psychological. But the truth is that no single step can be safely made in monetary science, unless the investigator keeps himself in conscious touch with his psychological basis during his whole investigation. We cannot, without special examination, even say that, in virtue

of the universal law of supply and demand, the more sovereigns there are the lower will be their exchange value. For in this universal law of supply and demand there is a psychological link. Why does an increased supply lower exchange value? Because an increased supply of any commodity satisfies the corresponding want more completely, and reduces the unsatisfied remaining want to a lower degree of importunity. Now in the case of money it is admitted that within wide limits the money function is exactly as well performed by  $x$  and by  $nx$  pieces, so that there is no unperformed money function and money want becoming less and less importunate for satisfaction as the number of sovereigns, but not the command of commodities in general, increases. Thus, if the law of demand and supply is regarded as objective and absolute, and the psychological link forgotten, its applications to monetary problems will have no demonstrative cogency.

We now turn to PRODUCTION and DISTRIBUTION, and here we note at once that the study of "production" must include the theory of labour, in which everything turns upon the law of the increasing irksomeness of successive increments of effort, and the decreasing psychological value of successive increments of commodity, or other result of effort; and the same law invades the study of distribution at every point, allying itself with the better-known physical law of diminishing returns to successive increments of any one factor of production, the others remaining constant.

In all the four main divisions of political economy, then, we see that the direction taken by economic study in recent years tends to a more express and generous recognition of the close connection between psychology and political economy, and the necessity of constantly keeping in touch with our psychological basis even when pursuing those branches of economic inquiry which appear to be remotest from it.

But, especially in connection with "production" and "distribution," another aspect of the question forces itself on our attention. We have hitherto enquired whether the psychological data of economics can be accepted absolutely as results and dealt with by general dialectic methods, or whether they can only be considered as principles, to be applied with constant reference to the psychological conditions of the special problem under investigation. We have now to ask further, are these psychological data, whether facts or principles, to include all the psychological considerations that actually bear upon the production, distribution, etc. of wealth, or are we artificially to simplify our psychology and deal only with the motives supposed to actuate the hypothetical

"economic man"? In the latter case political economy will be a hypothetical science. In the former it will aim at positivity.

And here again it will hardly be doubted that the tendency of recent work has been in the direction of enlarging the psychological area from which the data of political economy should be drawn. This tendency is manifested in two characteristic movements in recent economic investigation, which have in their turn reacted upon it. Firstly, the field of economic study, like so many others, has been invaded by the passion for the concrete method of enquiry, whether applied to contemporary or remote conditions. Now the man who studies the history of a great strike or trade-movement in Europe or America, of the land tenure or village industries of India, of middle-class or artisan budgets in England or France, of the growth and organisation of industry in the Hanseatic cities or the republics of Italy, of the fiscal systems of commercially related peoples, and so forth, finds himself studying the conditions of the production and distribution of wealth, but in a region in which the simplified psychology of Ricardo and Senior is wholly inadequate. So conspicuously is this the case that some economists are ready to admit that no general theory or science of economics is possible, but only a natural history of wealth, production, etc., while others are seeking to reconstruct the general theory of economics on broader and more universally applicable principles. And it is here that the second movement characteristic of recent times allies itself with the historical method. It is the much-discussed mathematical method, which from this point of view is the necessary complement of the historical or concrete method. For no sooner has the mathematical student given to the acknowledged psychological data of economics the form, at once rigorous and generalised, that his method demands, than he perceives that his formula really embrace the general theory of the distribution of resources with a view to maximising a desired result, independently of the nature alike of the resources and the result in question. This brings the economic conduct of man under the same laws as his conduct in general, and promises to give us the wider basis of which we are in search.

Our conclusions throw a curious light on the much-debated but little-understood contention of Auguste Comte, *Phil. Pos.*, vol. iv. pp. 193 *et seq.*, that there is no specific science of wealth, with its special laws and principles, and that the attempt to deal with the wealth-getting impulses of man in isolation must be essentially barren; but that special applications of general principles of philosophy to the industrial and commercial life may be prolific and illuminating in a high degree.

P. H. W.

## VI. POLITICAL ECONOMY, RECENT DEVELOPMENTS OF.

- (1) Economics as concerned with Currency, p. 143; (2) Economics as based on the Element of Labour, p. 145; (3) The Gradual Appearance of the Ethical Element, p. 145; (4) Application of (a) *A priori*; (b) Historical, and the Gradual Rise of the principle of Freedom with new Aspects of State Control, p. 146.

We propose in this place to present briefly a general outline of the leading doctrines of the science as progressively evolved, with the names of the authorities specially associated with each development, so as to indicate, as it were, the skeleton of the history of the science, leaving the student to fill in subsequently for himself the details and elaborations of particular problems. Much generalisation which was considered as true at the time when it was made, and even was true within the limited aspects or conditions of the subject as then presented, has since ceased to be applicable in the wider view or more highly organised system of production and distribution of to-day. And, on the other hand, much which must be still held to be true as ultimate principles, or as the permanent conditions or tendency, is temporarily in abeyance, or is even not applicable as an expression of immediately existing practical conditions or phenomena. Certain views or formulæ which formed part of the growth of knowledge have been superseded or may be regarded as eliminated or definitely on the shelf, and in their place more comprehensive conceptions arise which invite study as the frontier lines of the science and the basis of further progress. To some extent these changes may be attributable to the fact that with the progress of time the science has assumed sometimes more and more of an ethical character; or sometimes more and more the character of an applied science, the object aimed at being, not so much the mere systematising of knowledge, as the amelioration of the social condition generally. Even in regard to the object some change of view is apparent, the avowed purpose of investigation being less consciously an increased production of wealth, and more consciously "the greatest happiness of the greatest number"<sup>1</sup> even though the attainment of this end should involve some sacrifice of material wealth. A more philosophical statement of the case would, however, be, that the present ethical tendency of the science was inherent in it from the first, and its recent more pronounced development a process of natural and inevitable evolution. This widening of view is illustrated by the very definitions of the science. Thus, whereas ADAM SMITH introduced his great work, *The Wealth of Nations*, as an inquiry into the annual labour of nations as a "fund" of national wealth, and J. B. SAY took the

production of wealth, and RICARDO the theory of value as the subject of inquiry, ROSCHER, the founder of the modern historical school of political economists, begins his survey of the science with the declaration, "Ausgangspunkt wie Zielpunkt unserer Wissenschaft ist der Mensch"—the starting-point and goal of our science is man.

(1) *Economics as concerned with Currency.*—

If we go back to the economic investigations of the ancients we see a remarkable conformity in their views with the views which are again coming to the front to-day. ARISTOTLE (*q.v.*), accepting the institution of slavery as he found it, was really more concerned with the happiness of the family life and of the State than with the production of wealth, and on this basis engaged in the investigation of exchanges or commerce, the origin of value, and the real nature of money. The institution of slavery lingered on into our own times and was then abolished rather from ethical than economic considerations, though in this, as in other cases, the ethical view proved to be the true economic view in the end. Aristotle's inquiries led him to the perception that money was the creation of law, a merely conventional arrangement for promoting distribution, and it was probably this view of money as an instrument of distribution, as well as his ethical view that wealth was subordinate to man rather than that man existed for the accumulation of wealth, which made him an authority against usury. But Aristotle appears to have clearly perceived that the utility of gold and silver as materials was a condition of their suitability for their conventional use as an equitable instrument of distribution. In other words he seems to have perceived the importance of natural stability of value in relation to their conventional function. Philosophically expressed the former may be spoken of as the fiduciary system, and it rests, as has been well pointed out, on the doctrine of chances. The latter may be spoken of as the hard or labour money system, and it rests on the principle that money, like the things it measures, must itself be the product of labour, and on the belief that the unrestricted mobility of capital and labour, constantly searching for the highest reward, is practically competent to maintain an unvarying relation or balance between all the products of labour, including money itself. The philosophical interest in the controversy lies in the fact that it is a question of the maximum production and equitable distribution of the wealth produced by labour, consistently with the free operation of scientific principles and individualism, a problem which certainly seems to imply for its solution freedom of money and stability of value in exchange. The two extremes in the history of the science being a definition of money and a world-wide monetary controversy, it is not

<sup>1</sup> Though earlier English writers had been aware of this expression, its currency in these islands is due to the advocacy of BENTHAM (*q.v.*).

surprising to find that during a very large part of the intervening period economic investigation and discovery were mainly related to, or sprang out of, currency problems. The exchange of products was a condition of organised society, and currency was a necessary instrument of economic exchange. With the decline of the Roman Empire, itself largely a consequence of the fall of prices due to the failure under the slavery system—an uneconomic system of production—of a continuous and adequate supply of the precious metals as the instruments of exchange, the then existing stock almost disappeared. This fact, which is the keynote to the history of economic science up to the time of the PHYSIOCRATS, may be best studied in the writings of Mommsen, who has written a special treatise on the subject, of which a French translation (by the Duc de Blacas), *Histoire de la Monnaie Romaine*, is perhaps best known. It was the scarcity of the precious metals as the accepted instrument of exchange during the middle ages that led to the debasements of the coinages, the alterations of coinage ratios in different countries, the laws against usury, and the establishment of the so-called MERCANTILE SYSTEM. The ethical aspect of economics meanwhile continued a force (as evidenced by the writings of AQUINAS, *q.v.*) and strengthened or checked these developments in various ways. The treatises of Nicholas ORESME and COPERNICUS on the subject of money and coinage (reprinted in Paris under the editorship of WOLOWSKI in 1864) may be consulted as contemporary authorities on the difficulties of the period, and as examples of the progress of economic thought stimulated by the phenomena. Under such circumstances the mercantile system or the BALANCE OF TRADE theory was not without justification, indeed the same theory is practically recognised even by free traders in regard to the finances of India to-day. Amongst English treatises of the 17th and the early part of the 18th centuries on the subject, MUN's *England's Treasure by Foreign Trade*, 1664, and KING's *British Merchant or Commerce Preserved*, may be usefully consulted. Economic doctrines tend to crystallise into meanings which their authors would not recognise, thus COBDEN's free trade doctrine has lately been generally represented as a doctrine of low prices, though Cobden expressly repudiated this interpretation; and the desire for an adequate reserve of the metals which constituted the most easily exchangeable form of wealth, crystallised into an assumption that money alone was wealth. The impoverishment of France which resulted from the wars of Louis XIV., and the problems which were thus presented, led to the revolt of the physiocrats, led by QUESNAY and TURGOT, against this doctrine, and to what may be spoken of

as the rediscovery of the fact that real wealth consists of all exchangeable products, and that value is an expression of exchangeability of any kind. The necessary deduction was the doctrine of FREE TRADE. But really the same general conclusion had been arrived at from the consideration of the nature and functions of money alone. In JOHN LOCKE's *Considerations of the Consequences of the Lowering of Interest and Raising the Value of Money*, written in 1691 in opposition to LOWNDEN's anti-usury and coinage proposals, we have not only a recognition of the special or conventional attributes of money as distinct from other commodities, and a clear perception of the QUANTITY THEORY OF MONEY, but a general annunciation of the principle of free trade or free exchange, and the doctrine of LAISSEZ FAIRE. With Locke, however, as with Somers, Montague (see HALIFAX, Earl of), and NEWTON, the consideration of general economics was subsidiary to that of money; or to speak perhaps more accurately, general economics were summed up in the question of the reform of the currency which necessarily involved all considerations of prices and exchange. An American writer, Mr. DANA HORTON, who spent some time in England investigating the records of this country, has given in his *Silver Pound*, a valuable and scholarly exposition of the problem presented to Locke, Somers, Montague, and Newton, and their practical conclusions. It is a fact that the reconsideration of the real nature of money, and the recommendation of conditions necessary for the free international movement of money, preceded and were closely allied with the development of the free trade doctrine. The most conspicuous expounders of the relation between monetary conditions and free trade in the present century have been EMILE de LAVELEYE and Sir LOUIS MALLET, (see particularly the latter's posthumous volume *Free Exchange*). In the middle ages the monetary side of economics was forced on attention from the administrative point of view, as a question of government revenue and the provision of war funds. With the greater abundance of the precious metals, which followed the discovery of America, came a revival of industrial and commercial energy; an increase of production, exchange, and, consequently, wealth under the stimulus of rising prices; and a growth of self-assertiveness and power amongst the producing and trading classes. This caused what may be spoken of as a parallel development of the commodity side of economics. While the economic progress, which resulted from the great increase of the money supply from the mines of Potosi, developed a clearer perception of the disadvantages of monetary stringency, it also led to a recognition of money as a means to an end, rather than as an end in itself. The advent and influence of John LAW, with his

paper money and banking schemes, was made possible in this way. From the philosophical point of view what Law aimed at was the monetisation of landed property, and he sought to give such property the condition of easy transportableness, or circulation, recognised by Aristotle in gold and silver, by means of paper representatives. Law's disastrous experiments undoubtedly gave an impetus to banking as a means of promoting exchanges without the aid of the precious metals, or perhaps, to speak more accurately, as a means of supplementing the monetary use of gold and silver by means of notes or other credit instruments ultimately redeemable in gold or silver, and therefore, held for the time being as equivalent to gold or silver (see ASSIGNAT; REVOLUTION, FRENCH, ECONOMIC ASPECTS OF). Law himself, it should be noted, was a believer in the mercantile system, but his career powerfully contributed to the evolution of the physiocratic doctrine. As authorities on this stage, in the development of the science, Law's own writings, and Courtois's *Histoire des Banques en France*, may be recommended.

(2) *Economics as based on the Element of Labour*.—Adam Smith's treatment of labour and its employment, as constituting the real wealth-fund of nations, was a natural sequence of the revolt from the crystallised dogma of the mercantilists, and to proceed to regard labour as in itself the real standard of value, was a not unnatural step. There is some reason to doubt whether Smith's views on this point have been quite adequately expounded or even understood; assuming a theoretical perfect mobility of labour, and the non-existence of monopolies, and estimating different qualities or kinds of labour as different quantities of labour, there is a point of view from which Smith's dictum might be philosophically justified. Certainly the cost of production theory seems closely allied to Smith's views on this point. It was of course apparent to Smith that land is a factor in the production of wealth, inasmuch as he defines real wealth as "the annual produce of the land and labour of the society." The definition, it may be remarked, is scarcely comprehensive enough at the present day, as it is clear that the wealth of a nation may consist largely of the accumulations of past years, or of revenue derived from investments in other countries, as well as of its own new annual production. We are chiefly indebted to Smith for laying down the ground-work of the modern science, and explaining the general conditions which govern production, including the division of labour, and for the exposure of the fallacies of the mercantile system, and thus more clearly bringing into view the principles of economic exchange or distribution.

(3) *The Gradual Appearance of the Ethical*

*Element*.—After Smith's mapping out of the science, its ethical aspect could not fail to assert itself. The conditions of the creation of national wealth were defined; meanwhile poverty and pauperism continued to exist, and that fact brought the question of distribution permanently to the front. In the year following (1777) the publication of the *Wealth of Nations*, Dr. James Anderson, in a tract entitled *An Inquiry into the Nature of the Corn Laws*, stated the theory of rent generally known as Ricardo's (see ANDERSON), rent being described as in effect a premium for the cultivation of the richer soils, which reduced the profits of the cultivators to an equality with those of the cultivators of the poorer soils. Ricardo's definition was that rent arises out of the original and indestructible powers of the soil, begins when land of different qualities are cultivated, and increases with the increase in the inequality of the land successively brought under cultivation. MALTHUS and the anonymous author (Sir Edward West) of an essay, *On the Application of Capital to Land*, preceded Ricardo, in 1815, in the re-discovery of Anderson's doctrine, and in the mind of the former it necessarily led to the discovery of the law of diminishing returns, and of the doctrine that population tends to increase faster than subsistence. These laws and the counteracting forces operating against them have been discussed by many economists, amongst others, M'CULLOCH, Dr. T. CHALMERS, CAREY, J. S. MILL, Sidgwick, and Marshall (see DIMINISHING RETURNS). CAIRNES has conclusively established the former doctrine as a logical principle by challenging opponents to experiment, and by pointing out that the experiment is actually performed by every practical farmer when he brings inferior soil into cultivation, rather than force unprofitably soils of better quality. FRANCIS A. WALKER's examination, in *The Wages Question*, of the capacity of labour for gradual degradation, and the circumstances which interfere with the mobility of labour, fully demonstrates the "power" and the "tendency" of population to increase faster than subsistence. Counteracting forces, such as improvements in the methods of production, or increased efficiency, may control such tendencies; and it is the work of economists to elucidate and promote the application of such forces. Meanwhile the recognition of the tendencies or laws really reduced the question of the distribution of wealth to a question of wages. Ricardo held that with the constant necessity of resorting to inferior soils, prices and wages tended to rise and profits to fall. Here again we see the influence of the cost of production theory. We must remember that, as M'Culloch has pointed out (Introduction to *The Works of David Ricardo*, edited by M'Culloch), Ricardo arrived at the establish-

ment of general principles, and paid little attention to their practical application. As regards nominal wages, the doctrine is in a sense true; but the law of rent, as stated by Anderson, nevertheless implies the reduction of the real wages of agricultural labourers to the mere value of the produce obtainable with the maximum of effort from the poorest land, or the land that pays no rent. If the real wages of agricultural labourers have risen, it has not been in consequence of increasing scarcity of production in relation to demand or increased cost of production, but in consequence of the increased efficiency of labour as a result of the progress of the natural sciences and invention, and their application to the land.

(4) *Application of—(a) A priori.*—The attention given to the discovery of general or “natural” laws or tendencies, led to the establishment of what is now recognised as the *a priori* school of economists, while the lamentable conclusions to which some of these laws seemed to lead resulted in a revolt against submission to them. The “DOCTRINAIRE” school, influenced by its physiocratic origin, and, therefore, predisposed to attribute all wealth to the operation of uncontrolled natural laws and natural instincts, a view expressed in the very name of the physiocrats, adopted the principle of *laissez-faire, laissez-passer*, a phrase first used as the expression of an economic doctrine by GOURNAY, one of the earliest physiocrats and a friend of Turgot’s. The fact that some of the practical applications of this doctrine, free trade, for instance, were manifestly benevolent; and the long struggle against private monopoly resulting from State control in the form of the CORN LAWS, developed the extreme and uncompromising tenet, characteristic of what has been called the MANCHESTER SCHOOL—that State interference with industry and trade could in no case be beneficial, and that, if left alone, all economic evils would cure themselves. The opponents of this doctrine held to the principle of State control or national policy, which, though to some extent a revival of the principle of the mercantile system, was not absolutely identical with it. Its application from the landowning and capitalist point of view takes the form of so-called protection to native industry in the form of import duties; while from the proletariat point of view it has developed into the doctrines of COLLECTIVISM or SOCIALISM, including the State ownership of the land and of all the instruments of production and distribution. Between these opposing schools, both eminently doctrinaire in their way, has arisen a third school known as the HISTORICAL SCHOOL, which to some extent combines the teachings of both the other schools. This school, on the one hand, believes in natural law, and, on the

other, in the employment or control of natural law, in accordance with the teachings of experience, but without any needless waste of natural energy. It is a little remarkable that, whereas in the earlier part of the century, Manchester, under the influences of the anti-corn-law movement, was the centre of the *laissez-faire* doctrine; and London, under the influence of the landowners, was the stronghold of the principle of State control; London to-day is the centre of *laissez-faire* principles, while Manchester is the centre where the teachings of the historical school have been most appreciated and applied. This result is largely a consequence of the economic advantage which has accrued to Lancashire, in the form of increased efficiency of production, as a result of the factory and mining acts (see FACTORY ACTS) and the legalisation of TRADE UNIONS.

In resisting attack the extreme *laissez-faire* school found it necessary to propound new doctrines, or to emphasise old doctrines which no longer accurately expressed the actual facts of the time. In other words, the *laissez-faire* school having served a useful purpose, tended, like previous schools, to crystallise and to become more and more dogmatic. Chief amongst the newly evolved doctrines was that of the wages fund, perhaps most intelligently expounded by Nassau William SENIOR. This doctrine, like many others which have now been practically abandoned, arose out of conditions under which it was apparently true, and in so far as it expressed a relation between wages and the productive efficiency of labour was not without value. Its fallacies under present conditions have been fully exposed in Walker’s *Wages Question*, in which it is demonstrated that wages are now, at least partly, paid out of the product of present industry, and that new production rather than pre-existing capital, or that portion of capital applied to production, furnishes the true measure of wages. Another doctrine which has failed to stand in its entirety the test of modern research and developments is that of the dependence of exchangeable value on cost of production. To some extent this doctrine was based on Smith’s conception of labour as a standard of value, and Ricardo’s belief that prices and wages must rise with the diminution of production from poor land which required for its cultivation the same as, or even a larger quantity of labour than, rich land required. Modern mechanical developments, the approximation to annihilation of distance by the establishment of telegraphic, steamship, and railway communication, the consequent indefinite extension of cultivation to virgin lands, the instantaneousness of competition from all sources of supply, the rise of the “futures” system of anticipating production, and the vast improvements in productive power have all

tended to make the older doctrinaire authorities less authoritative as exponents of actual conditions. Thus, in recent times, production has, beyond all question, tended to increase faster than population, or, at any rate, the power of production has done so. The laws of diminishing returns and cost of production of the dearest margin have not operated to raise either prices or wages; it is indeed notorious that both have been fixed rather by the cheapest than the dearest portion of the supplies, even when the dearest portion has been required for consumption. The effect of the reduced monetary cost of Argentine wheat in lowering the price of wheat throughout the world in spite of statistical considerations is an illustration. With the recently developed solidarity of the world's markets, prices in many instances, and consequently profits and wages, now depend rather on variations in the monetary standards and relative indebtedness of different countries than on differences in the total actual economic cost of production. Variations in the relative values of the standards, in themselves largely a consequence of differences in the permanent indebtedness of borrowing, as distinct from lending, countries have made many of the old formulæ obsolete in a practical sense, though possibly true in an ultimate philosophical sense. Two doctrines which at present maintain a practical influence are the QUANTITY THEORY OF MONEY in relation to prices, and the doctrine of PROTECTION. The former doctrine was fully stated by J. S. MILL, and is maintained by Professor Foxwell and Professor Nicholson amongst more recent teachers of the science. J. S. Mill also reaffirmed the protectionist doctrine as provisionally applicable to new countries whose industry is practically limited to agriculture, as a means of beneficially introducing greater variety of production. The theory of protection philosophically considered has been most elaborately worked out in connection with the development of the United States. Its chief exponents have been Alexander HAMILTON, Friedrich LIST, Henry C. CAREY, and Simon N. Patten. An excellent account of American experience and thought on the matter has been compiled by Professor Ugo Rabbeno of the university of Modena, and an English translation has been published with the title *American Commercial Policy*. The doctrines of the collectivist or socialist branch of the State control school have been enunciated chiefly by Karl MARX in *Das Kapital*; see also Emile de LAVELEYE'S *Le Socialisme Contemporain*, and Paul Leroy-Beaulieu's *Le Collectivisme*.

(b) *Historical; and the gradual rise of the principle of Freedom with new Aspects of State Control.*—The founder of the historical school, which at the present time is practically in the ascendant, was Wilhelm Roscher, who inaugu-

rated the new departure by a treatise on the historical method of economic inquiry in 1843. Probably the most exhaustive summary of the kind, remarkable for its completeness as a treasury of economic facts and deductions and perfection of arrangement, are the five volumes of ROSCHER'S *System der Volkswirtschaft*, the production of which extended over about fifty years of the author's life. The first volume was published in 1854, and the fifth in 1894. Roscher's great work was designed as "a manual and text-book for business men and students," and the volumes deal successively with (1) The General Principles of Economics; (2) Agriculture and its Allied Industries; (3) Trade, Monetary Systems, the Exchanges, and Manufacturing Industry; (4) Finance; and (5), published posthumously, Poor-Relief and Poor-Law Policy. Roscher's method is analogous to that of the unbiassed experimentalist in physical science; in short Roscher was in economic science what Michael Faraday was in physical science. From his point of view the science is not limited to the production of wealth, but embraces the whole social, family, and religious life of man; speech, art, science, laws, history, and even physiology are all factors to be taken into account in the elucidation of economic problems. Most of the mistakes which were made by the older economists were due to the exaggerated importance attached to the desire to buy in the cheapest market and sell in the dearest—to the neglect of equally powerful influences in the nature of man and hindrances to the free play of this principle in the relative weakness of the workman—which procured for political economy the title of the science of selfishness. Amongst the most successful followers of Roscher's method may be mentioned Emile de Laveleye, Cliffe LESLIE, Wolowski, Cunningham, and Francis A. WALKER. The latter's restatement of the wages problem has probably done more to advance economics as a practical study for application in the amelioration of society, and for its vindication as a science than any specific investigation of a particular problem in economics since the time of Adam Smith. Another great result of the application of the HISTORICAL METHOD is the investigation of the limits within which the State may act to promote economic production and to control and counteract what may be spoken of as the occasionally uneconomic tendencies of unrestricted competition. Practical results of these investigations have been sanitary legislation, the various factory and mining acts for the special protection of women and children and for the general protection of the life and limbs of workers; the free education acts and municipal and state enterprises such as the gas and water undertakings of Manchester and the state railways of India; W. Stanley JEVONS'S *The State in Relation to Labour*, Lord Farrer's *The*

*State in Relation to Trade*, and Sir Frederick Pollock's *Land Laws*, may be usefully consulted with regard to the question of the economic justification and limitation of State interference. The relation between investigations in economics and the physical and biological sciences, established by the formation of the economic science and statistics section of the British Association, has also done much for the modern progress of political economy, and the long series of presidential addresses to that section form an invaluable record of economic thought and discovery in recent years. Apart from the practical effect of discoveries in chemistry and physics on agriculture and manufactures, the application of anthropometrical inquiries, and statistical investigation generally, to the study of economics, has long since dispelled the supposed antagonism between economics and the exact sciences. One result of this development of exact investigation has been the recognition of the personal and moral qualities of the labourer, his social surroundings, aspirations, and physical well-being, as economic forces tending to the increase of wealth, through the increase of efficiency. The contrast is apparent when we remember that Senior wrote, "it is not with happiness but with wealth that I am concerned as a political economist; and I am not only justified in omitting, but, perhaps, am bound to omit, all considerations which have no influence on wealth." To-day the happiness of the labourer is regarded as a most important influence in increasing the production of wealth. American statistical investigations in recent years have finally demonstrated the productive superiority of free over slave labour; Emile de Laveleye in his agricultural researches (*L'Economie Rurale de la Belgique, L'Economie Rurale en Suisse et en Lombardie, and L'Economie Rurale en Néerlande*) has shown, that the personal motive for the avoidance of waste under systems of peasant proprietorship and assured small holdings may more than compensate for the economic advantages of the application of the principle of the division of labour on large holdings. Amongst American economists Schoenhof (*The Economy of High Wages*) has done striking work in this direction. Perhaps the most impressive evidence of the change effected in economic thought by the historical school of economists, and by the recognition of the "interconnection of the sciences" developed by the British Association, is the fact that it is now possible to regard such proposals as that of a legislative eight-hours day and a fixed minimum wage from a strictly scientific, as well as from an ethical standpoint; or, in other words, to consider them as proposals tending to the increase of the national wealth and as true economic limitations in this sense to the doctrine of *laissez faire*. The relation between economics and the exact sciences is,

however, not limited to the last half-century. Aristotle was a naturalist as well as an economist; Copernicus and Isaac Newton both wrote on the currency and treated it as a question of fact and observation rather than of doctrine. Of recent writers Jevons' study of chemistry colours his *Principles of Science*, essentially a treatise on logic and scientific method; his study of geology influences his work on the *Coal Question*, which now influences the finance of this country through turning the attention of statesmen to the necessity of the redemption of the National Debt. And in the present day Suess of Vienna, the author of the great work *Das Antlitz der Erde*, has shown in his *Die Zukunft des Silbers* that the currency question is largely and in some respects essentially a geological question. There was something prophetic in the application of the name "physiocrats" to the first school of modern economists.

F. J. F.

#### VII. POLITICAL ECONOMY, POSTULATES OF.

Under this title Walter Bagehot proposed to pass in review the principal assumptions of economic science, as it had been developed in England (his title is *The Postulates of English Political Economy*), and to examine the conditions and the extent of the validity of each. The two essays bearing the title stated deal with *The Transferability of Labour*, and *The Transferability of Capital* respectively. The discussion of the former leads to the conclusion that there are at least four conditions which must be satisfied before it is safe to assume for any nation that labour can pass easily from employment to employment within it. These are stated to be:—(i) The existence of such employments for it to move between; (ii) the existence of an effectual government capable of maintaining peace and order . . . and not requiring itself to be supported by fixity of station in society; (iii) the nation must be capable of maintaining its independent existence against other nations without a military system dependent on localised and immovable persons; (iv) there must be no competing system of involuntary labour limiting the number of employments, or moving between them more perfectly than contemporary free labour (vide *Economic Studies*, p. 40). In discussing the second of the postulates, *the transferability of capital*, the conditions laid down for its applicability are that there should exist: (i) Capital at the disposal of persons who may wish to transfer it; (ii) transferable labour; (iii) such a development of the division of labour as to create what we call "trade," that is to say, a set of persons working for the wants of others, and providing for their own wants by the return-commodities received from the others; (iv) a medium in which profits can be calculated, that is, a *money*, and moreover, a good money; (v) the means of shifting

"money" from trade to trade, such as, the loan fund, the speculative fund, and the choice of employment by young capitalists or some of them.

The fact that some of the most fundamental of these conditions are by no means universally existent warns us that the conclusions of a process of reasoning in which they are implicitly assumed to be true are not to be applied without much care, if at all, to states of society where these conditions do not prevail. Much of the criticism which has been levelled at the position taken up by Bagehot in this matter appears to have as its object the insistence on the lack of universality of the principles enunciated and the consequent inapplicability, without very careful modifications, of these principles to certain problems of modern life, points which Bagehot himself explicitly recognised; one might go further and state that the two papers in which Bagehot dealt with these postulates were devoted to presenting the very view which such critics declare to have been entirely overlooked.

It is greatly to be regretted that the enumeration of economic postulates and their discussion by such a clear thinker and charming writer proceeded no further than the two essays already named. More exhaustive enumerations have been prepared by several writers, generally under the heading—premisses of political economy. Such premisses may be classed either as axioms or postulates, and the enumerations of leading writers include with more or less of precision the axioms: (i) That the earth is of limited extent and fertility, and that the return to capital and labour applied to it follows the law of decreasing returns; (ii) that population constantly tends to multiply faster than the means of subsistence can be increased. Beyond these axioms we have clearly enunciated the postulates (i): That the leading motive of human economic action is that which prompts to seek the greatest gain in return for the least possible expenditure of effort, sacrifice, and risk; (ii) that freedom of competition exists; (iii) that a sufficient knowledge of the market and intellectual power of judging of the efficacy of means to an end exists to enable such freedom to be exercised.

As Dr. Keynes remarks (*Scope and Method*, etc. ch. vii.), "it is clear that such enumerations as these cannot lay claim to completeness." This able writer goes on to point out that postulates are needed in reference to social customs and legal institutions relating to property; in regard to the variation of utility with amount of commodity; and that what is implied in freedom of competition needs more precise explanation.

It may be remarked that it is by no means necessary to retain the same postulates in every part of economic reasoning. This is illustrated

by the fact that discussions of the economic effects of monopoly are quite usual, and some modification of the postulate of freedom of competition is obviously demanded for the purposes of such a discussion. The theory of international values is an instance where this same postulate is modified very considerably. To quote once more from Dr. Keynes: "On the whole it seems best to regard any preliminary enumeration and examination of economic postulates, not as definitive or exhaustive, but simply as illustrative of the general character of economic theory." The selection given above comprises those which have been generally considered as more fundamental than others, and which recur most frequently, and which are entitled to special mention on that ground. For special problems the importance of the postulates named may become quite subordinate to that of others neither named nor even referred to here.

A. W. F.

VIII. POLITICAL ECONOMY, AUTHORITIES ON. The reader is referred for information on the literature of political economy to the separate articles on the various branches of economic science, which will be found throughout the Dictionary. In these, the principal authors whose works may be specially read with advantage in order to elucidate the subject discussed, are mentioned—either in the body of the article itself or in the bibliography at its close. When there is a separate notice of any of these authors in the Dictionary, the name is printed in small capitals. These notices include the principal economic writers in the British Empire, the United States, France, Germany, Holland, Belgium, Italy, Spain, Switzerland, the Scandinavian nations, and Russia, who were not living at the time the notice was written. Many minor writers have also been mentioned in cases when their works are difficult of access to the student, or when what they wrote is important as showing the economic position of their time.

In the historical notices of the different schools of economic thought—the American, Austrian, Dutch, English (including that on English early economic history), French, German, Italian, Russian, and Spanish schools—the principal authorities on economics of the school described are mentioned, and their relation to their contemporaries explained, together

with those circumstances of the period when they lived which may have exercised an influence on their writings.

POLL TAXES. See TAXATION.

POLLARDS AND CROCKARDS were clipped, base, or counterfeit coins of silvered metal, minted chiefly abroad, which under this more or less generic name obtained such an extensive circulation in this country during the greater part of the 13th and the first part of the 14th century, that the most stringent enactments of the three Edwards scarcely availed to cope with the evil.

The word "pollard" is probably derived from the substantive "poll" the head, whence the verb "to poll," meaning to crop or clip the head of anything (cp. "pollard elm").

Crockard may be akin to the Celtic word "croek," a broken piece of pottery, and may have been applied to the broken portions of the penny which circulated as half-pence and farthings in the 13th century.

Writs and ordinances concerning this false money were from time to time issued during the first part of Edward I.'s reign (stat. 3 Ed. I. c. 15; 7 Ed. I. Pat.; 11 Ed. I., m. 4, Oct. 28; (cp. also Ruding, *Annals of the Coinage*, ed. 1840, vol. i. p. 190); and an ordinance of the 12th year (Temp. incert. Ed. I. or II. Stats. of the Realm),—or, according to Ruffhead's Edition 20, ed. 1. stat. 4, 6, a proclamation describes the various kinds of false money then current. It is as follows:—"First they make there abroad a money of silver with a mitre; twenty shillings of which money weighs only sixteen shillings and four-pence of the money of England. Also they make two other sorts of money with lions, whereon there are bends in the one money and not in the other, but which are as light as the money with the mitre.

"Also they make as well on this side the sea as on the other a sort of false money, which is merely of copper, and is whitened, and when new it resembles the money of England. There is also another sort of money which is made in Germany under the name of Edward king of England, which weighs as little as, or less than, the money with the mitre, and that cannot be distinguished, unless it be by weight. The other deceit which they make in the money is that there are some of them who bring plates of pewter or of lead in the form of a penny, then they put them between two leaves of silver, and afterwards insert them into coin or into copper, where another penny well forged hath been struck." Still, in this description the coins are not severally defined by name, nor can we precisely determine whether any of them in particular, or all of them generally, came under the denomination of pollards and crockards. Ruding, after referring to these various counterfeit coins and quoting Hemmingford, p. 170, says "they were all white money, resembling silver, and were artificially compounded of silver, copper, and sulphur, so that in four or five of them there was not the weight of one penny of silver."

Although several ordinances against "false

money" were passed in succession to that quoted above, notably those of the twentieth year (1292), the first actual mention of these coins by name occurs in the *Stat. de Falsa Moneta* of 1299 (Ruding, i. p. 199) in which reference is made to the "divers bad monies known by the name of pollards and crokards (*sic*, *Old French*, 'Crozcard') and by other names, which are brought and left in the said kingdom . . . by divers persons coming from abroad" (Stats. of the Realm, vol. i. pp. 131-134). They were, it appears, introduced by merchants and passengers, concealed in bales of cloth or merchandise, or taken to uncustomed ports so as to escape the officers of the exchange.

In the same year (27-28 Ed. I.) by the king's command the pollard was allowed to circulate at the value of an *obolus*, that is of half a sterling. This estimate of their value is further confirmed by a petition of the twenty-eighth year, where the bailiff of Fiscamp (*sic* Fécamp?) is allowed to pay £100 in sterling in lieu of £200 in pollards, which the sheriff had refused to receive (*Rot. Parl.*, i. 144 b). Again, we get a description of the double pollard, five hundred pounds of which weighed, after refining, cccxxxii lib., x. s., and vii. ob. (£432, 10s. 7d.). Ruding, vol. i. p. 201, note 3.

At the time of their prohibition the king and others had obtained large amounts of pollards in exchange for sterlings, at the rate of five or six for a sterling, "men not caring for them" on account of their reputed baseness. But this calling in of them at such a low value proved a very profitable concern when it was discovered that two of them were equal to a sterling. Ruding (i. p. 207) refers to an alteration in the value of pollards and crockards which took place in the year 1310, and of the entire prohibition of them which followed "as productive of great inconvenience to the counties at a distance from the metropolis." He quotes instances of petitions for sheriffs who had received such money before its value was reduced, but who had not paid it into the exchequer when its currency was absolutely forbidden" (Madox, *Hist. of Exchequer*, i. 294; and *Rot. Parl.*, i. 273). In the chronicle of the year 1299, Matthew of Westminster writes:—"corrupta insula Angliæ de falsa Moneta, quæ dicitur Crockard et Pollard, in Natali Sancti Stephani protomartyris findebatur, id est, pro obolo habebatur. Hinc quidem Lathomi filius, considerans opera patris sui, dum fabricaret Ecclesiam metricæ et eleganter decorabat:

"Laude decoreris, nostris Sterlinge gereris,

Crokar es, æsque peris, fugias as rite teneris."

[See *Polychronicon*, Fabian, etc., also Walsingham's *Hist. Angl.*, p. 77, quoted by Ruding, note 6 to vol. i. p. 201.] A. L.

POLLEXFEN, JOHN, merchant, M.P. for Plymton, member of the committee of trade and plantations (1675), and of the board of trade (1696-1705), wrote two anonymous economic treatises.

*A discourse of trade, coyn, and paper credit, and of ways and means to gain and retain riches* (1697), reprinted with his initials (1700); and *England and East India inconsistent in their manufactures* (1697) (Anderson, *Or. of Com.* ii.

633). The former is a complete exposition of his views on trade and money. He believes in the force of the economic motive which "draws as the loadstone the needle" (p. 2); and this sentence on the vanity of prohibitions, "The removing of the cause, or the making of such a trade unprofitable, can only afford a remedy" (p. 9), recalls CHILD's *New discourse of Trade* (ed. 1694) (p. 168). Like Sir D. NORTH and LOCKE he knows that money is a commodity, and measures its commercial value by its weight and fineness (p. 11); and he attributes the export of gold to a variance between value of bullion and rates of exchange which was due to local gluts of coin or bills, and would soon right itself (pp. 20, 21). LOWNDES and BARBON's scheme for "raising of the coin" is stigmatised as a measure for relieving debtors who have money (p. 24), and as likely to lead to further measures of the same kind and therefore to hoarding (p. 34). He approves of paper money as an aid to, but not as a substitute for, coin, and points out that if inconvertible into coin it will be valueless or else coin will be hoarded (pp. 71, 72); coin must "lye dead" in order to "support it and make it useful" (p. 66). This criticism on the land and store banks of CRADOCKE, R. MURRAY, and PORTER, and (more recently) of ASGILL, BARBON, BRISCOE, and CHAMBERLEN, represents the best results of 17th-century economy. The author (Davenant?) of the reply to his second treatise (itself an answer to Davenant's *Essay on the East India Trade*, 1696), accused him of identifying national treasure with coin instead of with commodity; but he only wrote that the national "stock should be in money" (*England and East India*, etc., p. 46), money being "the most useful and best deserving to be called the treasure of a nation"; jewels, lead, etc., being less useful because difficult to exchange; silks, wood, etc., being useless until exchanged owing to their perishable nature (*ibid.* p. 7; *Discourse*, p. 157). Even this modified Midas-view, that coin is the best store of wealth, is kept in the background in the *Discourse*. There the main attack on the East India Co. is based on theories of wealth distinct from money. As with Locke high rents, and as with Child (*l.c.* pp. 88, 179) and FORTREY many men, and as with Child (*l.c.* p. 166), HOBBS, and PETTY many "tools" or "materials," mean much riches (pp. 9, 43, 54, 127, etc.); whereas the Indian trade undid what the naturalisation laws did, and brought in toys and silks, few of which (*pace* DAVENANT's statistics) were re-exported. He shares BELLERS's pessimism, and writes that we are "as a tree that hath many branches but little root," as "those that depend to have their riches and necessities from the sweat and labour of others are more in proportion than those that labour to provide these things" (p. 44). Like Sir W. TEMPLE, who merely adapts HOBBS, he treats bodily and mental labour (pp. 43, 46) and parsimony (pp. 80, 158) as the source and secret of "movable riches"; but echoes BACON's echo of MORE's lament that the brain labourers are mostly drones (pp. 44, 46), and that luxury is ousting parsimony. Since VIOLET (1651) there had been a busy controversy on unproductive consumption (Cunningham, *Growth of English Industry*, ii. 239)

but no one else put the impoverishing effect of foreign luxuries into the forefront of the Indian controversy, nor did any other writer make his first and main appeal to public opinion; "no reformation can be proposed that can do us any good but what must begin with ourselves, laws being dead letters unless the genius of our people, course of living and management, can be so changed as to co-operate therewith" (p. 153). But the writer of the *Discourse* was, like Davenant, only a great eclectic (he compares his views to Child's, ROSCHER compares them to NORTH's, etc.) so that you cannot argue with certainty from his theory to his practice. *England and East India*, etc. was written in support of the Foreign Lace Act (9 Will. III. c. 9, amending 13 & 14 Car. II. c. 13), nor does he understand, like Davenant, the specialisation of industries, and he wants to prohibit the export of wool and import of manufactured goods in order to keep Englishmen employed. Indeed his suggestion to prohibit the export of over £50,000 in specie to India is reactionary bullionism. He scarcely applies his notion of foreign to domestic trade. He balances trade with each country out of the custom-house books after the fashion riddled through and through by Barbon and Child (*l.c.* p. 154). But he wants any one to be free to trade at anything, sympathises with Sir H. Pollexfen's defence of interlopers, wishes to turn joint-stock into regulated companies, and opposes to Child's revival of CULPEPER's theory of interest arguments forged from the armoury of MADDISON (1640), MANLEY (1668), PETTY (1682), North and Locke (1691).

PONT DE NEMOURS, DU. See DU PONT DE NEMOURS.

PONTAGE. Money paid in lieu of personal service for the building and maintaining of bridges (see FYRD). In later times the word was also used for the tolls paid by persons passing over a bridge, which were devoted to its maintenance (Cowel's *Interpreter*).

A. E. S.

PONTANO, GIOVANNI (1426-1503). Born at Cerreto, Umbria (Italy), of noble parentage. Banished from his country, he took refuge with Alphonso I. of Aragon, king of Naples. Here he devoted himself to study; was loaded with honours and riches, served the house of Aragon as a minister and ambassador, and suggested reforms which ameliorated the economic condition of the Neapolitan provinces.

Pontano wrote in Latin several works: *De Magnanimitate*.—*De fortuna*.—*De prudentia*.—*De liberalitate*. A disciple of Aristotle, Pontano wrote on wealth, on labour, and the causes which render it more or less productive, on necessity as a stimulus to work. But, in substance, his researches present no originality, following closely the opinions expressed by Aristotle in the first book of his *Politics*.

Pontano discusses the duties of a prince, maintains that he should aim at promoting the public welfare, encourage trade and industry, and strive

to develop the intelligence of his subjects. On the question, debated by writers of his day, whether the state should carry on industries, he is among those who oppose such interference; but he does this only on moral grounds and reasons of expediency, and not by economic argument.

His precepts on taxation are sound, he gives good advice on economic morality, he opposes immoral taxes, as for example the tax on prostitution (*Opera omnia*, Naples, 1505-1508, 2 vols.).

[Fornari, *Delle teorie economiche nelle provincie Napoletane*, vol. i. Milan, Hoepli, 1882.]

U. R.

**POOL.** A division either of traffic or of its proceeds among several competitors, so as to remove the temptation to undersell one another. The word is used in America to designate what in England are known as joint-purse arrangements, but is of somewhat wider application. Pools may be divided into four classes. (1) *Divisions of the field*, where each competitor agrees to take the traffic of a certain district and withdraw from competition elsewhere. (2) *Divisions of traffic*, where the different competitors agree upon a percentage of the business to be handled by each concern. (3) *Gross money pools*, where they agree upon a percentage of the gross receipts. (4) *Net money pools*, where they agree upon a percentage of the profits. The last is much the closest form of combination, and generally involves a system of joint accounting.

The advocates of pools urge that they prevent reckless competition and consequent instability of rates. Their opponents claim that the effect of pools in keeping rates high more than offsets any gain to the community from keeping them steady. The traditional common-law view favours the opponents of pools (*Charlton v. Newcastle and Carlisle Railway Co.*, 5 Jur. N.S. 1096). Pooling agreements are usually held to be contracts in restraint of trade, and therefore against public policy; so that in the majority of instances the courts will refuse to make such agreements a ground of action (*Harford and N.H.R.R. Co. v. New York and N.H.R.R. Co.*, 3 Rob. (N.Y.), 411; *Stewart v. Erie and Western Trans'n Co.*, 17 Minn., 372, etc. etc.) Whether pools are really against public policy or not depends on the relative importance of stability and equality of rates on the one hand, as compared with that of absolute lowness of rates on the other. In industries of a quasi-public character, it may be more desirable that different individuals should be charged the same rates than that a lower average charge should be reached by making reductions for some and not for others. Under these circumstances pools may be a public advantage rather than otherwise. This is especially the case in railroad transportation. The working of the clause against pools in the INTERSTATE COMMERCE LAW (*q.v.*) has been dis-

tinctly bad. Not content with making these contracts void, as they perhaps were at common law, the framers of this statute made railroad pools a misdemeanour; causing much fluctuation in rates, and money losses to investors, without corresponding gains to consumers or producers as a class.

The attitude of the courts in England (*Hare v. London etc. Railway Co.*; 2 Johns and H., 480) toward such contracts is distinctly more favourable than in the United States, and on the continent more so than in England. The government railroads of Prussia, Austria, and other states have gone so far as to enter into permanent pooling arrangements with competing water routes; the authorities holding that by this means only can freedom from wasteful competition and unjust preference be effectively secured.

A. T. H.

**POOR.** Any treatment of the subject of the poor is rendered difficult by the loose way in which the term is applied. We distinguish the official and, to some extent, historical use of the term as applied to the class who are the objects of relief at the hands of the state in this country. We speak commonly of the poor law, relief of the poor, the poor-rate, guardians of the poor, etc. But since 1843, at any rate, a more exact usage has been gradually adopted, and the fact has been brought out that the objects of assistance under the poor law are only one section or class of the poor as a whole, viz. the destitute, or those who are in want of the necessities of life. Outside and beyond there lies a large mass of men who are rightly described as poor, but who, being possessed of the necessities of life, are in want of a larger or smaller amount of its comforts. Thus we may say that the term, officially employed, includes the destitute, but is not confined to them. When we read that the "poor are always with us," we mean that as the standard of living varies, whether in different countries or at different times, so the conception of poverty will vary, but the fact remains that many of the members of every community will fall below the average standard of comfort in living. In short, poverty is a relative, and destitution an absolute state.

This distinction between the poor and the destitute has led to a difference of treatment at the hands of statesmen. Whilst destitution is recognised, perhaps more and more generally, as a proper field for state-action and state-relief, poverty has, as a rule, been left to other organisations, or to individuals for assistance. There are not wanting instances, notably in the last century, when a confusion of ideas on this subject bred infinite practical mischief. Thus when the Berkshire magistrates put forth the celebrated "Speenhamland Act of Parliament" in the year 1795 they were misled by a vague use of language. In their opinion it was the business of the state to guarantee every

labourer the standard of living which they deemed sufficient, hence, when wages were insufficient to maintain such a standard, the deficiency was to be made good out of the rates (see ALLOWANCE SYSTEM). But experience has condemned such attempts, and the attitude of the state towards poverty has been one of two kinds.

I. The state has commonly adopted a policy of *laissez-faire*. It has left the care of the poor and the improvement of their condition to individual or organised action outside itself. Thus in mediæval times the poor were a charge on the revenues of the church. How far a specific portion of the tithe was devoted to their relief is a matter of dispute, but no doubt a moral responsibility lay on the clergy to provide for "God's poor." History shows us that the clergy and, still more, the monastic bodies were often mistaken in the methods they adopted. They did but relieve, as an old writer says, the poor that they had made.

II. Giving up the doctrine of *laissez-faire*, the state has found a new activity as regards the poor. Granting the existence of poverty, and leaving it as a *fait accompli* to be assisted by others, the state has directed its efforts to making easier the escape from it. It would take us too far to enumerate all the various agencies at work to achieve this end. Education is clearly one, temperance legislation is another, inspection, etc. of the dwellings of the poor is a third, and if we look yet further afield we shall see that laws against TRUCK, to secure free trade, and a good currency all help to secure this object. But shortly, the state may be said to have abandoned the attempt to deal with actual poverty, but to show an ever-increasing activity in preventing its appearance and in modifying its effects (PUBLIC ASSISTANCE ; POVERTY).

L. R. P.

POOR LAW, ADMINISTRATION OF. The existence of a poor law implies a redistribution of wealth by the state in proportion to men's needs. Under such a law the destitute have a claim to relief, i.e. to the necessities of life, and these clearly can only be provided at the cost of those who possess wealth in excess of their actual needs, and from whom it is taken by the state in the form of taxes. Now any such interference with the arrangements of society is sure, human nature being what it is, to produce certain results, some general, some peculiar to this form of interference. Thus we may expect a poor law to weaken the motive to exertion and to thrift. If the burden of providing for himself at any period of life is taken off the shoulders of a man, he is less likely to make such provision than when conscious of the necessity to do so, if he wishes to avoid starvation. So, too, he is more likely to be reckless in his manner of living. If it is indifferent to a man whether he supports

himself in old age, or is supported by the state, he is strongly tempted to squander in dissipation what should have gone to maintain him when his working days are over. Again, if he knows that provision by the state will be easily given, he is thoughtless in the matter of marriage, and population increases rapidly. Once more, though this is open to discussion, the relations between parents and children, their mutual responsibility, is weakened by a system which provides support independently of the assistance due from the one to the other. Thus some writers connect the warmth and closeness of family relations in Ireland with the long period during which no poor law obtained in that country. Lastly, the relations between employer and employed, roughly summed up as the labour market, are likely to be disturbed if the state supports its members independently of their earnings. If a man's income falls into two parts, one of which is the reward of labour, and the other is given independently of labour, the latter will soon eat up the former. So, too, the provision of pensions in old age is likely to prevent wages from rising to a point at which they permit of such a provision being made out of them. The extent to which these evils follow on a poor law will depend almost entirely on the way in which it is administered, for we need not, in this connection, discuss the general arguments by which a poor law is justified or defended.

If we consider the history of the English poor law from the date of its first definite beginning in 1601 down to the present day, some very clear conclusions may be reached. The spirit and the methods of administration have varied greatly during the three centuries which it has lasted. In some periods it has been administered strictly—in other periods the administration has been lax, and the variations are to be explained partly by reasons incidental to the state of society at a given date, and partly by the want of a scientific spirit in tracing the connection between effects and their cause. First of all, to define our terms. A poor law may be said to be administered strictly when the right to relief is circumscribed and restricted, when the conditions under which it is given are uninviting, or even deterrent, when the state of the recipient is less attractive than that of the independent labourer, and when political or other disabilities are attached to its receipt. On the other hand, when relief is obtained easily, and is open to all, when it is given under conditions which make it an object of desire rather than a thing to be avoided, and when no distinction is drawn between the pauper and his neighbours, then the administration is said to be lax. Now, roughly, these two principles are seen in the distinction be-

tween "indoor" and "outdoor" relief. Indoor relief is accompanied by enforced residence in a workhouse, with the accessories of a restricted diet, separation of sexes, a loss of liberty, a system of discipline, a prescribed uniform, and a more or less common life. All these features are peculiarly obnoxious to a domestic people, such as the English; though, doubtless, they affect different individuals differently. No such drawbacks attach to outdoor relief. The outdoor pauper receives his relief, whether in money or in kind, at his own home, he is surrounded by his family, he is his own master, he can eke out his dole by small earnings, he can take an interest in his surroundings, he leads a life of comparatively careless leisure. And by a natural train of thought, public opinion has placed a stigma on the receipt of indoor relief which is not connected with outdoor. Not for themselves only, but for their relations, do men shun the workhouse, and all that residence within its walls implies. To condemn a parent to the workhouse is held to be discreditable in children, to secure outdoor relief for him is regarded as a triumph of filial diplomacy. In considering the lessons to be learnt from the history of the English poor law, we shall regard a strict administration as identical with the use of the workhouse as a test of destitution, and as the normal form of relief, and a lax administration as going with the substitution of relief in the pauper's own home for relief in the workhouse.

In the earliest period of poor-law administration the workhouse was by comparison but little employed, but a substitute for it was found in the exaction of work from the able-bodied recipients of relief, for the "aged and infirm" relief was provided either in their own homes or in a poorhouse, built by the parish for the purpose, intended for the aged and infirm only, and consequently more on the lines of an almshouse than of the modern workhouse. But the intentions of the framers of the act of 1601 with regard to the able-bodied were defeated by the action of those who administered it. So long as its administration was confined to the duly elected and responsible overseers in each parish, the mischiefs of the system were kept within narrow bounds. It was the action of the magistrates, who overrode the decisions of the overseers, in virtue of an act of the year 1691 (3 W. & M. c. ii. § 11), that gradually developed these mischiefs. Relief was granted on "false and frivolous pretences," the labour test was applied in a half-hearted fashion or not at all, and by the middle of the 17th century we find proposals for making the test more real, by providing places in which the task of work should be performed. By the end of the century local bodies were busy obtaining private acts for the purpose of building

"work-houses," or "houses of industry," following in this the example set by the city of Bristol. In 1723, by the act 9 Geo. I. c. 7, was authorised the building of such houses, and the use of them as a test, by individual parishes, or by parishes in combination. The results of this growing strictness are to be seen not merely in a decrease of pauperism, but in the increased prosperity of the working class as a whole.

But the system, as was inevitable, raised a reaction against itself. Feelings of humanity (so called) were shocked by its strictness, men forgot the evils which it had remedied, or at any rate the fact that it was the system which had lessened them, and little by little the administration grew laxer and laxer. Workhouses fell into disuse, the overseers were called upon to find employment (ALLOWANCE SYSTEM), the aged and infirm were relieved at home, the maintenance of children was assisted by grants, and gradually the idea was impressed on the mind of the poor that it was well to look to the parish first for the necessities and comforts of life, and to their own exertions only when this source of supply failed. The melancholy tale of the results of this experiment are written at large in the histories of the period, in monographs, and in the report of commissioners appointed to inquire into the system of poor-relief in the year 1832. Shortly, it may be said that this second period, from 1750 to 1834, showed in the clearest light the effects of a lax system of administration. It had cut at the roots of independence and self-help; it had fostered suspicion, heartlessness, and vice, had paralysed industry, and lowered the moral no less than the material standard of living all through the country.

The return to strictness after 1834 remedied, though slowly, the state of things which laxity had produced. Able-bodied pauperism, by comparison, disappeared; old-age pauperism was greatly diminished, the encouragements given to population were lessened, and the returns of illegitimacy began to fall off. The principle of the act of 1834 was to make the position of the pauper undesirable, and with that object relief was to be confined, as far as possible, to the four walls of a workhouse; only sickness and old age were allowed as reasons for giving relief at the pauper's own home. It would no doubt be an exaggeration to say that the improvement in the condition of our working class in the last half-century is mainly due to the reform of the poor law alone. But if we have succeeded in showing that certain results might be expected from certain methods of administration, and that in practice such results are shown to have followed, it is not going too far to say that a strict administration is a negative condition of the well-being of the poor, and that a

relaxation is likely, if not certain, to favour the growth of misery and the decay of character.

So far we have been endeavouring to show that the administration of a poor law should be strict, if the evils contingent on its existence are to be avoided, or repressed, and that a strict administration is in the best interests of the poor themselves, and therefore dictated by humanity no less than by reason. We go on to ask how such strictness may be attained. Now it is a cardinal truth that in a democratic state, laws will only be enforced so far as they are supported by, and in harmony with, public opinion. The act of 1834 erred, perhaps through the needs of the time, in building up a system which derived its strength largely from its centralisation. The area within which the local bodies can act at their own discretion is very small. Hence the poor law has never recommended itself to the popular mind; it has been resented as being imposed from without, and its administration has been improved mechanically, without reference to the popular support on which it must ultimately rest. The effect of a recent act (*Local Government Act 1894*) has been to throw the control of the administration into the hands of the great body of the population, and the results of the change are anxiously awaited, for it has coincided with a tendency on the part of public opinion to favour a more lax system. But as knowledge grows and experience widens their lessons cannot fail of effect, and we may look hopefully forward to a new period of poor-law history, when strictness will be the rule, it may be after some experience of the evils of laxity, and when it will be guaranteed, not by the edicts of a central authority, but by the heartfelt support of the great body of public opinion acting through its representatives, no less than through its officers.

It remains only to notice some points on which administration may be amended.

(1) It is quite possible that, owing to the rise in the standard of living all over the country, the condition of the inmates of workhouses might be improved without its ceasing to act as a deterrent, and it may safely be left to the ratepayers to determine how far they are willing to contribute to increase the comfort of such inmates.

(2) The restriction of outdoor relief is proceeding gradually, and its ill effects are fast disappearing, partly in consequence of the scale on which it is given, a scale which stands in a totally different relation to the standard of living from that in which it stood to the standard at the time at which it was adopted. The extinction of this mischievous system can only be the result of greater knowledge and sounder reasoning, and will probably only be achieved after a great increase in the powers of guardians.

(3) The treatment of the sick has been greatly improved of late years, and, in London especially, the workhouse infirmary is coming more and more to be regarded as a public hospital. The question may be asked whether this principle should not be carried further; and the disabilities of pauperism removed in cases where the sickness of the patient is such as to necessitate his treatment in an institution. If this were done all outdoor medical relief might be discontinued, and the poor encouraged to make provision for themselves against slight and ordinary ailments by means of provident dispensaries and the like. But such a scheme would perhaps involve the treatment of the hospital question as a whole.

(4) The education of pauper children is still a field for experiment and observation. The systems adopted vary greatly. In some unions the children are brought up and taught in the workhouse itself, in others they live in the workhouse and attend the common schools of the place, in others they are placed in large boarding-schools distinct from the workhouse geographically, but an integral part of it; elsewhere they are boarded out, or placed in small groups in cottage homes under the care of foster parents, these homes being in some cases formed into an artificial village, in others scattered through ordinary villages. It can only be said that no one system has yet made good its claim to be considered exclusively the best.

(5) The treatment of vagrants has already been considered (MENDICITY).

[For the system of administration at various dates the works of Aschrott, Fowle, and Nicholls, so often quoted, are full of information, and further authorities will be found in the references contained in those works; see also LEGISLATION, ELIZABETHAN.]

L. R. P.

POOR-LAW HISTORY. It is not possible to name a date at which the legislature determined to have a poor law. The origins of the poor law are derived from FEUDALISM. Settlement and the claim to relief are developments of the SERF's obligation to work on the land of the MANOR, and his corresponding right to derive a maintenance therefrom. When this condition of *status* had given place to hiring and a system of contract, the right of the lord of the manor to bring back his serf to the place where his labour was due, ceased to be valuable. The presence of the serf, where his labour was no longer required, became a burden. The duty of maintaining him, when destitute, was transferred from the manor to the PARISH. The assumption that the poor were *adscripti glebæ* runs throughout. The right to *bring back* having fallen into desuetude, the right to *drive out* the unsettled poor naturally arose. The authorities of the parish church were enjoined to make collections for the poor. The church-

wardens, the curate, and then the bishop were to exhort, and if the people proved contumacious the justices were to order an assessment. This brought on the general assessment of 43 Elizabeth, c. 2 (1601). Was this act a necessity? The alternative pursued in Scotland is instructive. The legislature of Elizabeth followed similar legislation enacted for Scotland, but as was remarked by a parliamentary committee reporting in 1817: "the intelligent persons to whom the administration of it has been entrusted . . . appear to have had so much foresight and judgment as to its effects, that they have very generally and successfully endeavoured to avoid having recourse to its provisions for a compulsory assessment." Till 1845 there was in Scotland no universal assessment for poor rates. The authority of the English precedent then decided the policy of the northern country.

The stronger government of England did not permit "intelligent persons" to evade the law. Henceforward, down to 1834, a perpetual struggle went on between the relief authorities and the relief claimants, as the following brief references will show.

The 13 & 14 Charles II. c. 12 (1662), bears the title "An Act for the better Relief of the Poor," but it is usually known as "The Settlement Act." It recited that poor people migrated in search of better "stock," i.e. employment, and it is apparently assumed that they would not do so if, in their own parishes, benefit under 43 Elizabeth was not withheld. The act was promoted in the interest of the metropolitan parishes, then causing alarm by the growth of their population. At this date the policy of the legislature was to enforce concurrently rigidity of settlement and facility of relief. Henceforward the problem was to curb the abuses to which these regulations gave rise.

Thus 3 & 4 William and Mary, c. 11 (1691), recites that overseers are criminally profuse, accordingly the vestry and the justices are given certain controlling powers. The act had an effect contrary to that expected. The 9 George I. c. 7 (1722), recites that far from controlling, magistrates increased the prevalent mismanagement. Accordingly this act authorised the building of workhouses, and the withholding of relief from those who refused to enter them. This provision, where workhouses were used as a test of destitution, checked the advance of pauperism. The 22 George III. c. 33—GILBERT'S ACT (1782), obliged guardians, in parishes which adopted its provisions, to find for all unemployed poor persons work suitable to their strength and near their own homes. The 36 George III. c. 23 (1796), found that the workhouse test, as permitted by 9 George I. c. 7, was "injurious to the comfort and domestic situation and happiness

of such poor persons," and justices were authorised to order relief to "industrious poor persons" at their own homes. By this legislation every obstacle to pauperism was removed. The rout was further accelerated by the proclamation of allowance scales by the county magistrates.

One act of reparation, 35 George III. c. 101, "An Act to prevent the Removal of Poor Persons until they shall become actually Chargeable," was passed in 1795. It was rendered necessary by the unrepealed provisions of acts for the better relief and settlement of the poor. ADAM SMITH has commented on the cruelty of these ill-considered laws of settlement, but Sir F. EDEN, without palliating their criminal unwisdom, thinks that they could be easily evaded. The complete adscription of the labourer to his settlement was not brought about by the power of removal resting with the parish into which he migrated, but by the inducements to remain in his settlement held out by the profuse administration of relief, and by the refusal of employers to hire any but those who were partly supported by the rates. The law which made the unsettled labourer liable to removal was practically inoperative, but the laws for the better relief of the poor had the unexpected result of reducing the labourer to the immobile and dependent condition of a feudal serf.

The task of the Commissioners of Inquiry appointed in 1832 was to expose and suggest a remedy for these evils. Their celebrated Report was drafted by Mr. Nassau SENIOR, aided by Mr. (afterwards Sir) Edwin CHADWICK. It proved the incompetence of all the authorities then administering the law, and recommended a new central control, which should be independent of political party, a principle already recognised by the government in the appointment of the enquiry commission. It proved also that property was being destroyed by the relentless advance of pauperism, that employers were defrauding the public by throwing their wages-bill on the parish, that labourers were being deprived of every motive for doing honest work, that the domestic life of the poor was being ruined by the parish endowment of bastardy and the neglect of all family affection, that the attraction of the so-called benefits of this spurious philanthropic legislation was confining the labourer to his parish, bereft alike of energy and hope. When we consider how entirely the economic progress of the working class has depended on the facility with which labour has been able to distribute itself and find its profit in new and ever-changing conditions of industry, it will be obvious how injurious this perverse legislative endowment of immobility has been. The mobility of labour and its transferability to different industries, more especially through its power to direct the labour of the young, are the elements which prevent labour sharing the fall of prices, the

inevitable result of free trade and increased manufacturing skill.

The new Central Authority, it was recommended, should have power to issue orders regulating the local administration. The principles which these orders were to inculcate were summed up as follows:—The condition of the pauper must be less eligible than that of the independent labourer. All relief given to the pauper at his own home must be deemed inconsistent with that rule. The poor law is for the relief of destitution, not of poverty. A precise and practical definition of destitution was added. A man is destitute when he is willing to relinquish the maintenance derived from his own resources for one provided for him in a well-regulated workhouse. In short, the workhouse test is the sole method of fulfilling these conditions. Experiments on these lines had been tried at Southwell and Bingham and had succeeded in effecting the emancipation of the pauper. The workhouse, though a measure of confinement for a few individuals, was an instrument of emancipation for a whole class.

An act based on these recommendations was passed in 1834. The prohibition of outdoor relief to the able-bodied, issued by the new central authority, had an almost miraculous effect. Pauperism, it had been generally assumed, was caused by the growth of a surplus population. When confronted with the workhouse, that drastic instrument of social surgery, the alleged surplus disappeared. The farmer and manufacturer, no longer able to draw their wages fund from the rates, and relieved of the burden of wasteful parish expenditure, paid their labourers an adequate reward. The majority of the labouring population found work in their own parishes or the next parish, others migrated to the manufacturing districts. For this last movement the commissioners organised facilities. By these measures the independence of the able-bodied labourer was secured, and the healthful circulation of labour restored. Violent opposition was offered to further reform. The three commissioners yielded to the storm and confined the application of their principles to the pressing case of the able-bodied, during the period that they actually were able-bodied. They thus gave a narrow interpretation to the responsibilities of the able-bodied. Owing to the unpopularity of the commission, it was deemed advisable in 1847 to alter the constitution of the central authority. The Poor-Law Board was accordingly created, and the central authority, which had hitherto been indirectly represented by the home secretary in parliament, became a department of state, and its president a member of the government. A period of exhaustion seems to have followed the strenuous efforts of the commissioners. About 1869 there was a revival of interest. In that year Lord (then Mr.) Goschen issued a circular from the

Poor-Law Board calling attention to the necessity of a stricter administration of the law, and pointing out the utility of co-operation between the poor law and charitable agencies as a means of promoting that end. Mr. Fawcett's *Pauperism*, a courageous attack on popular prejudice, was published in 1871.

The conferences for the discussion of poor-law administration were established between 1868-1870. Admirable reports on the abuses of outdoor relief, in the country by Mr. E. H. Wodehouse, 1871, in the town by Mr. (afterwards Sir) Henry Longley, 1873, were issued by the Local Government Board which, in 1871, took over the duties of the Poor-Law Board. The London Charity Organisation Society was founded in 1868, and its members have very actively taken up the question of the better administration of the poor law.

The arguments of these reformers may be briefly summarised:

They desire to carry the principles of 1834 to their logical conclusion. The maxim, that the condition of the pauper must be less eligible than that of the independent, cannot be confined to the able-bodied at one period of his life. The responsibility of the able-bodied does not exclude sickness, old age, and the wants of those dependent on him. Successful experiments of a strict indoor relief policy continued at Bradfield, Stepney, Whitechapel, and other places for over a quarter of a century are quoted in the same way as were Southwell, Bingham, and Uley in 1834. Pauperism of all forms is slowly but surely being eradicated by the policy there pursued. Economic progress is built up by the successful discharge of responsibilities, and the future of the working class depends on their retention of the right to meet them. The text set by Lord Goschen in 1869, that charitable funds must be used to meet the hard cases which might otherwise be turned to make bad law, is strongly urged. The substitution of outdoor relief from a voluntary as against a legal source is an advance, for a voluntary fund does not exercise the same baneful fascination over the imagination of the poor, as the apparently inexhaustible funds put at their disposal by the poor law. The old poor law impeded the labourer's progress in exchanging status for contract; the maladministration of the new law atrophies his capacity for complete economic independence. Since 1867, a year marked by the passing of the Metropolitan Poor Act, great improvements, involving much additional expense, have been made in poor-law schools, infirmaries, and workhouses. This policy has in many cases been carried out in connection with a stricter administration of outdoor relief.

These views make progress, but they do not appeal to the majority which is guided by sentiment and long-established custom. As

Burke once remarked: "Reason is fatigued; experience has given judgment; but obstinacy is not yet conquered." Guardians have it in their power to eradicate or to multiply pauperism to an indefinite extent. Whether the legislature, especially in a democracy, will ever see fit to limit a discretion too often abused is a question which only the future can determine.

[Poor-law literature is so large that a short bibliographical note must necessarily be inadequate. The following are leading authorities, arranged to some extent chronologically. R. Burn, *The History of the Poor Laws*, London, 1764, gives a learned account of the continuity of our English poor-law system. Sir Frederic M. Eden, *The State of the Poor, or a History of the Labouring Classes in England from the Conquest to the Present Time*, 3 vols., London, 1797, has collected, in the most painstaking and judicial spirit, an invaluable encyclopædia of facts and opinions. During the troubled period, 1796-1834, innumerable pamphlets and more ambitious treatises appeared. The general characteristics of the time may be sufficiently gathered from Sir G. Nicholls' *History* and from the *Report of the Poor-Law Commissioners*, 1834 (see below). It may be enough to mention that BENTHAM's works, particularly *Tracts on the Poor Law*, printed in vol. viii. of his collected works, should be consulted for the origin of some of the ideas afterwards incorporated in the Poor Law Amendment Act 1834. The connection can be traced through the influence and writings of his disciple, Mr. (afterwards Sir Edwin) CHADWICK; see *The Health of Nations: a Review of the Works of Edwin Chadwick*, by Benjamin Ward Richardson, 2 vols., London, 1887, and pamphlets by Sir E. Chadwick too numerous to set out in detail. The publication most fruitful in result belonging to this period is probably *Eight Letters on the Management of our Poor, etc.*, by an Overseer, Newark, 1822, reprinted from the *Nottingham Journal*. This was the work of Mr. (afterwards Sir George) Nicholls, and contains an account of the dispauperisation effected at Southwell and Bingham by methods which the legislation of 1834 sought to make universal. The classical document on the whole subject is the *Report of the Royal Commission*. This was appointed in 1832, and its report was published in 1834. A preliminary volume entitled *Extracts from Information received by His Majesty's Commissioners, etc.*, was issued in 1833. The report and appendices of evidence run to over 8000 pages folio. The report has been reprinted as a parliamentary paper. The standard work on the subject is *A History of the English Poor Law*, by Sir George Nicholls, K.C.B., late Poor Law Commissioner and Secretary to the Poor Law Board, London, 1854 (new edition published 1898). He passes somewhat lightly over the opposition to the new poor law which fell within the period of his own official career. This omission can be supplemented by reference to the file of the *Times* from 1834-1850, or by consulting such books as *The Book of the Bastiles, or a History of the Working of the New Poor Law*, by G. R. W. Baxter, London, 1841; or the more reasonable *Letters of S. G. O.* (the Rev. Lord Sydney Godolphin Osborne), two vols., London, 1891. *Pauperism: its Causes and Remedies*, by Henry Fawcett, London, 1871, contains a valuable interpretation of history; Dr. P. F. Aschrott's *Das Englische Armenwesen, etc.*, Leipzig, 1886 (translated under the title, *The English Poor-Law System*, London, 1888), is a most valuable and well arranged manual; *The Better Administration of the Poor Law*, by W. Chance, Hon. Sec. of the Central Poor-Law Conference, etc., London, 1895, contains the best exposition of different methods of poor-law administration; *Children under the Poor Law*, by the same author, London, 1897, gives a very full account of a special branch of work.

The opposition to what in the text has been called the "party of reform" has not often sought the publicity of print. Mention may be made, however, of (1) a paper, "On the Advantages of Out-door Relief," read at the Central Poor-Law Conference, 1891, by Mr. Mitcheson of Rugby. For a criticism on his statistics see a paper by Mr. Chance, *Charity Organisation Review*, May 1892. (2) "Plain Words on Out-door Relief," London 1894—an anonymous pamphlet and correspondence in the April and June numbers of the *Charity Organisation Review*, 1894; also *Report of the Whitechapel*

*Guardians* for year ending Lady Day, 1894. (3) Also for an argument in favour of an almost indefinite extension of relief facilities, paper read by Mr. George Lansbury, of Poplar, at Central Poor-Law Conference, 1897, on the "Principles of the English Poor Law"; and *Fabian Tract*, No. 17, on "Reform of the Poor Law." For fluctuations of popular and official opinion see Reports of the Poor-Law Conferences (for list of subjects discussed, see index to *Report of Central Conference*, 1896), and Annual Reports of the Poor-Law Commission, the Poor-Law Board, and now of the Local Government Board. T. M.

**POOR LAW, SCOTCH.** In its origin and early history the poor law of Scotland closely resembles the corresponding legislation in England and many of its enactments are obviously modelled on the latter. The primary object of both was the suppression of VAGRANCY rather than the relief of destitution. In a society organised on feudal principles, involuntary PAUPERISM was of necessity comparatively rare, while the "sornare" or sturdy beggar was the crying evil of the time. Even from the first, however, it was impossible to ignore the existence of a certain amount of helpless pauperism, and the suppression of vagabondage was seen to involve the organisation of beggary. Thus the acts of 1424 with which Scotch legislation on the subject may be said to begin, permitted begging only to those below fourteen and above seventy, with a further exception for the impotent, who were to wear a badge.<sup>1</sup> Then in 1535 begging was forbidden outside the parish of birth, the headmen of which were also instructed to make "takings" or collections for the support of its poor. The foundation of parochial responsibility was thus laid; the structure in its essential features was completed by the comprehensive statute 1579, c. 74, to this day the basis of the Scotch poor law, as the act of 1601 is that of the English. Between 1579 and 1698 a long series of enactments were passed to facilitate the enforcement of the law, but they left its fundamental principles unaltered. The same may be said of the only important enactment of the last two hundred years—the Amendment Act of 1845, which however has greatly modified the practical administration of the law.

We will now consider briefly the leading features of the Scotch poor law, with special reference to the points in which it differs from the English. In the first place the distinction between the masterful beggar and the impotent poor was decisively emphasised by the act of 1579, which prescribed for the former the ferocious punishments characteristic of the time. In 1617 they were after the English fashion committed to the care of the justices of the peace, and the parish constables to be appointed by them. In 1663 a species of enforced slavery was authorised, and by the act of 1672 and the proclamations of the privy council in 1692 and 1698, correction houses were prescribed, but without result. Owing to

<sup>1</sup> The most highly privileged mendicant in Scotland was the "Blue-Gown" or King's Bedesman. The class became extinct about 1863, but the type was immortalised by Sir Walter Scott in Edie Ochiltree of the *Antiquary*.

the relatively backward and unsettled state of the country, vagabondage long continued a much more serious evil in Scotland than in England, but the treatment meted out to the vagrant has been broadly similar in the two countries. In Scotland vagrancy is now dealt with by the police under 25 & 26 Vict. c. 98, 1862 (see VAGRANCY). In their treatment of the able-bodied poor, however, as apart from vagrancy, the English and Scotch poor laws are radically dissimilar. The provision in the act of 1601 granting relief to the able-bodied in exchange for work has no counterpart in the Scotch law. In England the principle thus admitted gradually received a more generous interpretation, till early in this century it was made to sanction a wholesale system of out-door relief to the able-bodied, with results disastrous to the nation and more especially to the independence and morality of the labourers themselves. But in Scotland the class of persons entitled to claim relief as a right, remains, as under the act of 1579, those who, being wholly or partially disabled by age or infirmity, "of necessitie mon live bee alms." When the impotence is permanent its subjects are placed on the regular parish roll; when merely temporary, relief is given during disablement. But these classes, denominated respectively the regular and the occasional poor, have alone a right to demand relief, and able-bodied persons out of employment cannot even at the discretion of the authorities be legally ranked as occasional poor. The expediency of adhering to this principle under the conditions of modern industry with its recurring periods of depression will naturally depend largely on the adequacy of voluntary effort to meet the demand made upon it on such occasions. The experience of England, where the claim of the able-bodied is admitted, has, at all events, done much to strengthen the case in favour of the Scotch system.

The establishment of a settlement or right to relief in a parish depends on birth or residence for a term of years. By the act of 1845, five years' continuous residence without recourse to common begging is required for the acquisition of a settlement, and at least one year's continuous residence in any subsequent period of five years for its retention. Wives follow the settlement of their husbands, and children of their parents. Relief, however, cannot now be refused to the impotent who have no settlement in the parish, but the relieving parish is given recourse against the parish of settlement. The law of settlement in Scotland, though the source of considerable litigation and expense, has always been free from the peculiar hardships so closely associated with the working of the English law. A power of removal of persons likely to become chargeable, such as existed in England from 1662-1795, has never been known in Scotland. There no one is liable to be removed who does not actually solicit alms, and as a consequence the checks and counterchecks which complicate the operation of the law in England are entirely absent.

By the act of 1579 the authorities entrusted with the administration of the law were the magistrates in burghs and the justices in landward parishes, who were instructed to appoint overseers

and collectors. But the constituted authorities seem to have been lacking in zeal, and before the close of the century the enforcement of the law had been committed to the kirk-session with the assistance of the presbytery. During the civil war the powers and duties of these ecclesiastical bodies in respect of the poor naturally fell into abeyance, to be restored, however, in 1672, with the substitution of the heritors for the presbytery as co-adjutors of the kirk-session, an arrangement which subsisted till 1845. The kirk-sessions and heritors were, it is true, subject to the supervision of the magistracy, but, unlike the justices in England, the Scotch magistrate had no power to interfere with the ordering of relief; and to this is partly to be attributed the fact that the operation of the poor law in Scotland was never marked by the undue laxity and careless extravagance which, prior to 1834, characterised its administration in England. In this connection also it is to be noted that the general assessment sanctioned by the act of 1579 was not absolutely compulsory, as in England under the 43rd Elizabeth, but only compulsory at the option of the local authorities. Each parish was responsible for the support of its own poor. But down to middle of the 18th century the method of assessment was rarely adopted, the poor being supported out of the contributions at the parish kirk. But with the break-up of feudalism and the clan system, and the advent of the modern industrial régime, came a rapid increase in the claimants for relief; while the equally rapid growth of dissent from the Established Church seriously curtailed the amount of the available funds. Under the kirk-sessions and heritors, however, the stern teaching of the Calvinistic church dominated the administration of the law. A legal assessment was avoided where possible, on the ground that it tended to sap the foundations of self-reliance and thus to encourage pauperism. This was the position of Dr. CHALMERS. Still the commission of inquiry appointed in 1843 found that the relief given was in general, but more especially in the Highlands, quite insufficient, that the amount was determined not by the necessities of the pauper but by the amount of the voluntary contributions, and that steadily, if slowly and with misgiving, the authorities, especially in the larger towns, were being driven to the adoption of the legal assessment. Under the act of 1845, in all parishes where it was resolved to raise the necessary funds by assessment, the administration of the law passed to a body, called the parochial board, elected by the ratepayers, the burgh magistrates, and the kirk-session. A central authority called the Board of Supervision was created to secure greater uniformity in the administration of the law, and to protect the interests of the pauper against the too extreme parsimony of the local boards. The latter were directed to appoint as clerk, relieving officer, and sole executive of the board, inspectors of the poor, dismissible only by the Board of Supervision. The pauper was at the same time granted a right, said to have been much abused, of appeal to the sheriff against a refusal of relief. Under the Local Government Scotland Act 1894, the board of supervision was superseded by the Local Govern-

ment Board for Scotland, while the powers and duties of the parochial boards were taken over (May 1895) by the newly created parish councils. With the advent of the new régime in 1845 the transition to the system of legal assessment was greatly accelerated. In 1845, 230 parishes raised the funds by assessment, 650 by voluntary contributions; and within ten years the numbers had become 700 and 183 respectively. In 1896 out of 877 parishes or combinations all save 24 had adopted assessment. With regard to the distribution of the burden the principle of the Scotch poor law has always been that each should contribute according to his ability—his “means and substance.” There are various modes of approximating to this, but the only one now legal is that by which one half of the assessment is imposed on the owners and the other half on the occupiers of real property, rateably according to the net annual value of their heritages. Of the 853 assessed parishes only 162 at present (1896) avail themselves of the power of classification of occupants granted by § 36 of the act of 1845.

In dealing with the aged and impotent poor, the prevailing method in Scotland has always been that of out-door relief. Under the sway of the kirk-sessions and heritors this took various shapes, such as money, victuals, or a license to beg, according to the state of the voluntary funds. Only in a few of the larger towns were there poor-houses for the reception of the aged and helpless. By the act of 1845, however, facilities were given for the erection of poorhouses on the English model; and in 1896 there were 66 such poorhouses representing parishes with an aggregate population of 3,933,841, leaving only parishes with a population 91,806 still unprovided for. The result of their application as a test of destitution is seen in the steady decrease in pauperism. For some years after 1845 there was a marked increase in the number of the registered poor and their dependants, but this was largely the result of the changed conditions of relief and not of a real increase in pauperism. Taking the fifty years 1847-96, while the population has increased from 2,781,000 to 4,170,000, the number of paupers and their dependants has decreased from 106,000 to 98,000. For the first twenty years of that period the ratio per cent of paupers to population remained about 3·8, and for the last twenty years the average was 2·5, and in 1896 it stood at 2·3. When, moreover, allowance is made for the rapid increase of the lunatic poor, the falling-off in the numbers of the ordinary poor is seen to be still more pronounced. Taking the ordinary poor, we find that in 1877 there were 8046 “indoor” to 85,334 “outdoor” paupers. In 1896 the former had increased to 9569 while the latter had fallen to 76,494. Pauper children are as far as possible boarded out in the rural districts, and this feature of the Scotch system is generally admitted to be one of its best.

[Nicholls, *History of the Scotch Poor Law*, London, 1856.—R. P. Lamond, *The Scottish Poor Laws*, 2nd ed., Glasgow, 1892.—*Annual Reports* of the Board of Supervision, 1846-95, and of the Local Government Board for Scotland, 1896 onwards.]

POOR RATES. See RATE, INCIDENCE OF.

## POOR RELIEF AMONG THE JEWS OF ENGLAND.

I. General, p. 160; II. Historical, p. 160; III. Institutions, p. 161.

I. *General*.—The relief of the Jewish poor in England is, and always has been, almost entirely carried on by the Jewish community. This state of things is not due to the fact that any legal disability prevents, or ever prevented, English Jews from availing themselves of relief under the poor law, but is explained mainly by three causes: (a) the unwillingness of poor Jews to take refuge in any workhouses except those few in which special arrangements are made to enable them to observe the complicated dietary regulations prescribed by their religion; (b) the natural charitableness of Jews towards the poorer members of their faith; (c) the desire of the Jewish community to protect itself against misconception by preventing poor Jews from becoming chargeable to the poor rate. Sir Julian Goldsmid, a leading member of the Jewish community, said in the House of Commons on the 11th of February 1893, “By means of the Jewish Board of Guardians we Jews in this country have endeavoured as far as possible to relieve our Christian fellow-countrymen from payments on our behalf” (*Hansard's Parliamentary Debates* for 1893, viii. 1199).

II. *Historical*.—Though Jews have lived in England since the Restoration, and have always regarded it as their duty to relieve the poorer members of their community, the history of their more important charitable institutions scarcely goes back beyond the beginning of the 19th century. This is due to the numerous divisions which existed within the community throughout the 18th and more than a half of the 19th century, and which have not yet entirely disappeared. The first Jewish settlers in England in the 17th century were men who, though coming mostly from Holland, were of Spanish or Portuguese descent. They founded a synagogue in Bevis Marks, London, and several charitable institutions, which, though doubtless sufficient at first for the wants of their poor, were on a small scale. Among the institutions were a charity school for children of the congregation (1664), an orphan school for boys (1703), and for girls (1730), societies for giving dowries to portionless girls (1724), and for apprenticing boys (1749), a hospital for the sick and aged (1747), and a society for distributing food to the poor (1778). But the Spanish and Portuguese Jews were, in the latter half of the 18th century, outnumbered by the German and Polish Jews, who, continually recruited by immigrants from Germany, Poland, Russia, and Holland, founded three

synagogues in London in the 18th century—the Duke's Place Synagogue in 1722, the Hamburg or Hambro, Synagogue in 1736, and the New Synagogue in 1760. Each of these synagogues was a separate organisation. Each devoted considerable funds to the relief of its own impoverished members, though even this work was somewhat irregularly performed owing to the fact that the synagogue revenue was to a great extent made up of the voluntary offerings of members, and was therefore somewhat fluctuating. But, besides the members of the synagogues, there was always a large class of poor persons, mostly foreigners, who, though regarded as belonging to the German and Polish portion of the community, had never been in a position to contribute towards the funds of a synagogue, and had therefore never acquired the privileges of membership. There was no permanent arrangement among the three synagogues for the relief of this class of the unattached poor until the foundation of the Jewish Board of Guardians (described further on) in 1859. Sometimes, indeed, it was agreed between the three "German" synagogues as a temporary expedient that, out of every four unattached Jews seeking relief, two should be dealt with by the Great Synagogue, the largest of the three, one by the New, and one by the Hambro. But even this arrangement was not adhered to for long, and a competent authority describes how, at another period, "the strange poor, to complete the given shilling, had to call first at the Great Synagogue for the first moiety of sixpence, and to the other two city synagogues for the two remaining moieties of threepence severally."

Another good authority, writing in 1801, says that "the synagogue administration, with respect to the poor's aid, is . . . very inadequate as to funds, and ill-directed as to manner." The synagogue funds, however, were largely supplemented by private charity.

The first effort to introduce unity and system into Jewish poor relief was made in 1801, when a proposal was brought before the government of the day by Abraham Goldsmid, the leader of the German and Polish congregation, for the constitution, by parliamentary authority, of a board which should consist of representatives appointed by the various synagogues, and should have power to assess the synagogues and individual Jews for contributions, and to devote the money raised by this means and by voluntary donations to the establishment of a school, a hospital, a workhouse, and an asylum for the aged. The scheme met with opposition and was dropped. But the same impulse that gave rise to it led to the foundation of the "Jews' Hospital for the Reception of Aged Poor, and Educating to useful Industry Youth of both Sexes," opened at Mile End in 1807. The establishment of

the Jews' Free School in 1817, of the Jews' Orphan Asylum in 1831, of the Jews' Infant School in 1840, and of additional homes for old men and widows in 1840 and 1843, did much to relieve the condition of the Jewish poor. But the synagogues remained apart; and, as has been said above, there was no organisation to deal with the "unattached poor" until 1859. Numerous as are the charitable institutions of the English Jews at the present day, the history of poor relief among the English Jews during the last thirty-eight years is practically the history of the Jewish Board of Guardians.

III. *Institutions.*—The chief charitable institutions in London at the present time are as follows:—(a) *The Jewish Board of Guardians*, established in 1859 by the three German synagogues to provide one general authority for the distribution of charitable relief, partly in addition to, and partly in supersession of, the relief dispensed by the synagogue authorities themselves and by private donors. The Board was at first intended to deal chiefly with "unattached" Jews, *i.e.* those who were not specially attached to, and relieved by, any synagogue; but this limitation of its work was removed within a few months of its foundation. The board now consists of fifty-five members, *viz.* thirty-two elected by the subscribers, twenty-one elected by the members of the London synagogues, and the two overseers of the poor appointed by the Council of the United Synagogue. It carries on its work through the relief committees, which distribute money, nourishments, and medical and surgical help; the loan department; the emigration department; the industrial department, which apprentices poor Jewish boys and girls to employers who undertake to allow them to observe the Jewish Sabbath and festivals; the clothing department; the fixed allowance committee; the sanitary department, which endeavours to secure the removal of sanitary defects in the habitations of persons assisted by the board; and the workrooms, which provide instruction and employment in sewing to destitute Jewish women and girls. The departments are mainly administered by members of the board, with the assistance of a staff of paid officers, of a visiting committee consisting of about fifty honorary visitors, and of about a hundred and twenty "visiting guardians of apprentices."

The income of the board for 1906, exclusive of sums received for investment (legacies, *etc.*), was about £62,000, made up as follows:—subscriptions, donations, and subventions (from individuals and synagogues), £34,000; income from investments, trust funds, *etc.*, £7000; repayment of loans by borrowers, £18,500; repayment of premia by apprentices, £2500. The expenditure was about £65,000, *viz.* gifts of

money or kind, temporary allowances, medical relief, etc., £20,000; permanent allowances, £9000; emigration, £7000; loans, £21,000; apprenticeship, £3000; work-rooms, £800; sanitary department, £600; expenses of management, £4000. (b) The Jews' Hospital and Orphan Asylum, formed by the amalgamation in 1876 of the Jews' Hospital, founded in 1807, and the Jews' Orphan Asylum founded in 1831. The institution maintains, educates, and apprentices about 340 orphan children, and grants pensions to eight aged persons. Its expenditure in 1906 was £12,050. (c) Home for Aged Jews, formed by the amalgamation of three institutions founded in 1840, 1843, and 1871. Expenditure in 1905, £1800. (d) Board of Guardians for the relief of the poor of the Spanish and Portuguese Jews' congregation, founded 1837. Expenditure in 1905, £1800. (e) Home and Hospital for Jewish Incurables, founded 1889. Expenditure 1905, £3700. (f) Soup kitchen for the Jewish poor, founded 1858. Income in 1896, £2000. (g) The Russo-Jewish committee, founded in 1881, which administers a fund raised in that year and increased in 1905 for the relief of Jewish sufferers from persecution and popular violence in Russia.

There are, besides, numerous smaller institutions, and the amount annually expended by specifically Jewish charitable institutions in London is probably about £130,000. There are, in addition, Jewish boards of guardians in Manchester and Liverpool, each spending about £1500 a year, and one in Birmingham spending about £1000.

B. L. A.

**POPULATION: ECONOMIC THEORY.** (For recent movements, see **POPULATION, THE SLACKENING INCREASE OF**, in the Appendix.) By the population of a country is meant the *numbers* of its inhabitants, and, whatever account is taken of differences of quality, it is of quality in close relation to numbers. Like all other statistics, the numerical data of population require an interpreter, an observer able not only to count, but to collate and reason. He must, for example, distinguish between a change in

the method of investigation and a change in the facts investigated—as where there is a growing accuracy of registration or enumeration, and the real increase in numbers is less great than the recorded.

Taken by itself, a single census, giving the numbers of human beings found alive in the British Isles on a particular day, say 5th April 1891, tells us nothing of one important feature of population—its perpetual change. It would give us the statical view, which might be also the qualitative or demographical, of the distribution of ages and sexes, and of ranks and occupations. But a second census enabling us to compare the numbers at two periods, and thereby estimate the movement between them, gives more than twice the illumination of one. To be used fruitfully the statistics of population must be comparative.

Further, the data must be used with the cautiousness appropriate to their imperfections. It is given to few countries, as to few individuals, to count exactly; the questions of a census must be few, direct, and simple, or the intentional, as well as the unintentional, errors will be multiplied. The greater the numbers of a people, the more true will averages be, and the more truly may general conclusions be drawn (see **STATISTICS**). But, on the other hand, verification becomes more difficult; and the statistician must consider how far he may justly assume that the inaccuracies are a constant quantity, or cancel each other on the whole, or be inappreciably few in view of the largeness of the area.

Taking a nation like our own, which has at its command the chief, if not the whole, of the scientific apparatus necessary for sound statistics of population, we find among the institutions established largely if not wholly for the ascertaining of facts in relation to this subject the following:—

(1) The decennial census (see **CENSUS**), giving the numbers of the people as enumerated on a particular day.

(2) The annual returns of the registrars-general for England, Scotland, and Ireland, giving the numbers of births, marriages, and deaths.<sup>1</sup>

(3) The returns (to the board of trade) on emigration and immigration.

The figures yielded by all three may be used to check each other; and the usefulness of the check will be evident when it is observed that the numbers of the people, as estimated by 2, for the year of the census, are never found to coincide exactly with the enumerated numbers of the census itself. The divergence is, however, so small in comparison with the great numbers enumerated (in 1891, 238,000 out of

<sup>1</sup> For England we have (a) annual reports; (b) decennial supplements thereunto; (c) quarterly returns; (d) weekly returns; (e) annual summaries.

29,000,000—hardly 1 per cent), that we evidently possess accurate enough knowledge on this subject to draw general conclusions as to general tendencies. The use made of these figures by statesmen, whether for electoral or financial purposes, may here be neglected. The special difficulties of the actual enumeration are considered elsewhere (see CENSUS). The numbers of the nations of the world are now known with a fair approximation to accuracy. The strictly economic aspects of the subject are an ample theme by themselves.

Political economy is occupied, in the first instance, with the results that would flow, in human societies, from the pursuit of material wealth. But the bare abstraction, desire of wealth, has been so unfruitful, that all economists have been quick to add to it a group of rival elementary desires, such as desire for leisure and desire for marriage. The desire for marriage is introduced "for the sake of practical utility" (J. S. MILL, *Unsettled Questions*, p. 140). The effect is to deprive political economy of a great part of its abstractness, yet the inclusion is inevitable; if we exclude the desire of marriage, and all reference to increase or decrease of numbers, we go far to treat society as inanimate, not to say non-human. Thus at the rise of political economy, both in England and in France, the study included the subject of population, and therewith of statistics. Political arithmetic, one of the precursors of economics in England, was mainly an endeavour after statistics of population; and the spread of life insurance and annuities, at the end of the 17th century, helped to swell the numbers of those who were studying the facts. The writers of the mercantile school (see MERCANTILE SYSTEM) had considered economic policy rather than economic principles. But the PHYSIOCRATS and the Scottish philosophers were forming economic principles, however tentatively. The absence of a census served to make the discussions more indecisive, but possibly also to make the sifting of principles more complete. From very want of facts men were driven to principles in order to reach the facts deductively. The academical debate between the champions of the ancients and the champions of the moderns led to D. HUME'S *Essay on the Populousness of Ancient Nations*, 1752. Hume at once dismisses the notion that the world was in its prime in antiquity and is now old in modern times. Men are much the same now as then, and we cannot tell when the prime of the world gives place to its old age. Against the special diseases of our own age we have to set the special troubles of ancient society. "The equality of property among the ancients, liberty, and the small divisions of their states, were indeed favourable to the propagation of mankind. But their wars were more bloody and destructive, their governments more factious and

unsettled, commerce and manufactures more feeble and languishing, and the general police more loose and irregular. These latter disadvantages seem to form a sufficient counter-balance to the former advantages, and rather favour the opposite opinion to that which commonly prevails with regard to this subject" (*Essays*, vol. i. pp. 468-469, 4to ed. 1768). There can be no doubt what was Hume's own view,<sup>1</sup> though when challenged by Dr. Robert WALLACE, he took refuge in scepticism. His arguments involve a close scrutiny of the classical authorities; but there shines through the whole the *a priori* principle that the ancient world could not have been more populous than the modern, and therefore it was not. It could not have been, mainly because "wherever there are most happiness and virtue and the wisest institutions there will also be most people" (*ib.* 427). Were all difficulties removed, almost every one would marry; "and the human species would more than double every generation." How fast do men multiply in a new colony, and how quickly are the gaps filled up after a plague! "Where there is room for more people they will always arise" (*ib.*).

The prevailing tone amongst political writers had been that population could not be made to grow fast enough. BOTERO, in 1589, *Delle cause della grandezza delle città*, had no doubt pointed out that the *virtus generativa* of men was the same as it always was, but the *virtus nutritiva* became more and more hampered. But Botero was soon forgotten, and the same views were only in the 18th century rising again into the consciousness of his countrymen (especially GENOVESI and ORTES, the former not altogether clear). FRANKLIN, writing in 1751, *Observations concerning the Increase of Mankind*, remarked that there is no bound to the increase of living things, whether plants or animals, provided they have room and food and no rivals. The growth of the American colonies was exciting general attention in Europe. These colonies had arisen from economic as well as political causes; and they were destined to be as instructive economically as politically.

Besides all this, a debate was waged through a great part of the 18th century that came far nearer home than the antiquarian controversy of Hume and Wallace; it was debated whether the numbers of the English people were decreasing, and, if so, whether the large towns were the cause of the decrease. RICHARD PRICE, the promulgator of the *Northampton Table of Mortality*, maintained the affirmative in both cases

<sup>1</sup> See Gibbon, *Decline and Fall*, ch. ix. (pub. 1776, in the year of Hume's death). As to the superior populousness of the north in ancient times, says Gibbon, "a more serious inquiry into the causes of population seems to have convinced modern philosophers of the falsehood and indeed the impossibility of the supposition. To the names of Mariana and of Machiavel we can oppose the equal names of Robertson and Hume."

against J. HOWLETT, W. WALES, and Arthur YOUNG. The discussions on the effects of enclosures, and of large and small farms, were largely affected by the views of the various disputants on the major question of DEPOPULATION. The *Essay* of MALTHUS (1798) soon silenced the followers of Price, though it was unconnected both in origin and in aim with their controversy.

It has more than once happened in the history of economic study, that—to the eye of the later historian—the times seem fully ripe for the enunciation of a particular doctrine, when yet it is either not proclaimed or else when proclaimed excites no attention. The dependence of population on subsistence, and the tendency of population to overtake, if not to exceed, subsistence, had been stated by QUESNAY when he wrote: *La propagation n'a de bornes que celles de la subsistance, et elle tend toujours à passer au delà; partout il y a des hommes dans l'indigence.* (Quoted by Oncken in art. Quesnay, *Handw. d. Staatswissensch.* p. 329, without a reference.)<sup>1</sup> Quesnay converted the Marquis MIRABEAU to this view (Higgs, *Physiocrats*, 1897, p. 23). The doctrine of TURGOR as to the tendency of wages to a minimum implied a similar view of the tendency of population to a maximum. The said tendency of population had been observed by Dr. ROBERT WALLACE (*q.v.*) to have vital importance for projects of social reform. ADAM SMITH, finally, had remarked that "the demand for men necessarily regulates the production of men; quickens it when it goes on too slowly, and stops it when it advances too far" (*W. of N.*, I. viii.). "Every species of animals naturally multiplies in proportion to the means of their subsistence, and no species can ever multiply beyond it" (*ib.*). He had noted also the rapid increase of the American colonies and the causes of it. The population, he says (1776), doubles there in twenty or twenty-five years, not because of immigration, but by "the great multiplication of the species" (*W. of N.*, I. viii.). But when Malthus, till then completely unknown, published his *Essay on Population* in 1798, he made as great an impression as if nobody till then had written on population. The two great schools of political economy, the French and the English, adopted his doctrine with little or no modification.

The chief arguments of the *Essay* have been fully presented elsewhere (see art. MALTHUS). They owed their impressiveness (1) to the attention then excited by GODWIN's *Political Justice* to which the *Essay* was a reply; (2) to the directness of their bearing on current English economic policy, especially in the matter of poor laws; (3) among economists, to the skill with which the theory of population was incorporated with the general doctrines of the economic system, and brought into connec-

tion with all the leading questions in economics, then as now under discussion.

Assuming that food is necessary and the desire for marriage ineradicable, Malthus contends that not only is the increase of population limited by the increase of food, but wherever there is increase of food there will be a corresponding increase of population. Yet the increase of the food compared with the increase of population is slow, laborious, and difficult. "Population when unchecked increases in a geometrical ratio; subsistence increases only in an arithmetical." (See ARITHMETICAL RATIO; GEOMETRICAL RATIO.) Malthus in short begins abstractly to suppose all impediments to population removed, and all impediments to production of food left standing, then the one will increase geometrically, the other arithmetically.

Up to this point all seems simple, and all had been said before, even as to the ratios by Voltaire; but Malthus showed in detail the modes by which the tendency of population to increase was repressed, so that the actual numbers were brought within the limits of the actual food. Plants and animals reproduce themselves, and the new offspring, finding no food, dies. In the case of men, this only happens with the most savage, most nearly akin to the brutes. With the others the repression is effected in various indirect ways, under various disguises. The checks are "vice and misery," and "the fear of them." They are preventive as well as positive, preventing births as well as causing deaths. Malthus in 1803 pleaded guilty to exaggeration; and admitted that among the preventive checks was moral restraint, which was certainly neither vice nor in the ordinary sense misery, though by his own definition it might be the fear of it. If the 1st edition of the *Essay* gave a picture of the struggle for room and food in its gloomiest aspects, the 2nd brought out more fully how among civilised peoples it is a struggle for the attainment or more often for the retention of a standard of living, in which, in proportion to the degree of civilisation, the necessities of life go far beyond the bare physical requisites of mere living. Yet the average man will marry and will need to struggle to preserve the accustomed necessities. The pressure of the principle of population will make itself felt as a stimulus to his labour and inventiveness. Felt it will always be. The pressure of population on the means of providing necessities will continue as long as the race continues.<sup>1</sup>

Of the conclusions fairly deducible from the arguments of the *Essay*, the following are the most important to the economist and the statesman.

1. The principle of population is a chief,

<sup>1</sup> Mr. Lyttleton (see below) is probably right in contending that there is no tendency in the case of human beings to increase *beyond* the food, unless there have been artificial encouragements. But there might still be a tendency to increase *up to* the food.

<sup>1</sup> See also notice below (p. 160), of works of l'Abbe Mann.

perhaps the chief cause of poverty, and its effects cannot be removed though they may be aggravated by human institutions. It is also the chief cause of low wages.

2. The only sound encouragement of population is the encouragement of industry, especially agriculture.

3. Very fertile lands are comparatively scarce, and an increasing population compels the cultivation of the less fertile. Hence arises the phenomenon of rent.

4. The pressure of population is a stimulus to industry. Population, unchecked by prudence or necessity, increases geometrically; production of necessities, unaided by invention, increases arithmetically.

5. Relief of the poor by poor rates (see POOR LAW) or CHARITY (*q.v.*) does not by itself add to the food, and therefore only raises the price of the existing supply. Emigration relieves the pressure for the time, but, if there is no greater prudence than before, the gaps are soon filled, and the old pressure reappears.

6. The difficulty is not remote but present, for a population is adequate<sup>1</sup> or excessive in relation to the actual not the possible food. Nothing but greater prudence of the several citizens will remove it. The burden of responsibility lies on the individual, not on the state.

7. An increase of population is both safe and desirable if caused by a low death-rate; it is much less so if caused by a high birth-rate. There is in the former case an economy; in the latter, if without the former, there is a waste of lives. (See *Essay* (later ed.), bk. ii. viii., *On the Checks to Population in England*.)

8. A high standard of living is as desirable for the whole people as for the middle and upper classes, and it is best preserved by late marriages.

These are only a few deductions that might be made from the *Essay*; and, as they are not all equally evident, they were often attacked in detail by critics unable or disinclined to controvert the first principles. Much too was built upon the *Essay* that has needed reconstruction or demolition; the theory of rent has submitted to the one, and the theory of a wages fund has not escaped the other. We are now more careful than Malthus to point out that a change in distribution of wealth may convert an excessive population, into a well-fed population, provided that production is adapted to the change. But the first principles of the *Essay* suffered hardly at all from the earliest critics, and have been little amended by the latest.<sup>2</sup>

<sup>1</sup> 'Giusta popolazione,' Genovesi, *Lezioni di economia civile*, pt. 1. ch. v. p. 122 (in the *Scrittori Classici di Economia politica*, vol. vii. 1808).

<sup>2</sup> The mathematical formula for the growth of population was restated by Quetelet, *Physique Sociale* (1835). Another restatement has been recently put forward by Professor Karl Pearson, *Stat. Journal*, June 1896. Compare the formula in Malthus, *Essay*, ii. ix. footnote.

Something was felt to depend on a question of fact. America was taken by Malthus as the best example of a near approach to the conditions under which the highest theoretically possible increase would be realised; it was important to be sure therefore that the doubling of the American population in twenty-five years had been due to natural increase, and not simply to immigration from the Old World. Francis PLACE (*Illustrations and Proofs of the Principle of Population*, 1822) was able to show this with great effect from Dr. Adam Seybert's *Statistical Annals, 1789-1818*, of the United States (publ. 1818), and from the English records of ships and passengers cleared for the United States, under the Act 43 Geo. III. c. 56. The years when governments were restless from wars and rumours of wars were precisely those when emigration and immigration would be closely watched, and the records would be most likely to be full and accurate; and the records pointed to an emigration of 10,000 per annum at the utmost (Place, pp. 68, 69), while the population of the States increased from 4 millions in 1790 to 7½ in 1810 (*ib.* 46). The census of 1820, not published at the time PLACE wrote, made the population for that year 9½ millions. In other words the increase had been at the rate of about 225,000 per annum, of which emigration accounts for less than  $\frac{1}{20}$  part (*cp. Edin. Rev.*, Jan. 1820, p. 70; and July 1821, p. 365 *seq.*). The free population, as distinguished from the slave, increased at a much faster rate than this (see Macaulay's article on Sadler, *Edin. Rev.*, July 1830, pp. 318, 319).

The illustration of Malthus was thus substantially justified. Since then the United States have become more and more like Europe in the filling up of room, if not in the supplying of food, and we can no longer point to the States as a much nearer approach to geometrical increase than can be found elsewhere.

An interesting attempt to modify the Malthusian doctrine by American experience was made by A. H. EVERETT (*New Ideas on Population*, 1823). Everett considers that an increase of population is not likely to take place without bringing with it an increased efficiency in the production of food, the new men being new workers, and in civilised countries becoming in each generation more and not less skilful owing to their numbers and the resulting division of labour. A careful statement of the Malthusian doctrine will show it to be quite consistent with this "new idea." Malthus himself needed to explain to SENIOR that to say population had a tendency to increase did not mean that it actually did increase,—that on the other hand the actual progress of humanity in invention and industry was not due to any "tendency" in the same sense of the word, such progress being not spontaneous, but the result of vigilance and effort (see *Two*

*Lectures on Population by W. N. Senior, Prof. of Pol. Ec., Oxford, with a Correspondence between the Author and the Rev. T. R. Malthus, London, 1829).* In short, if man relaxes his watch over his appetites, his numbers will increase to the level of the food; but to increase the food he must use his reason. Appetite unwatched by reason will bring men to poverty; this is perhaps the most succinct statement of the Malthusian "law" of population.

Malthus himself speaks oftener of a "tendency" and a "principle" than of a "law." Sadler on the contrary wrote a book entitled *The Law of Population* (1830), in which he tried to prove that the prolificness of human beings, otherwise similarly circumstanced, varies inversely as their numbers (vol. ii. p. 352), meaning that where the population is dense the births are few, and where it is thin they are many. On the best interpretation, this could only mean that population increased fastest where there was most room for it. Obviously the food is as important as the room, but if we add food then Sadler's principle is that of Malthus. Doubleday, *Law of Population* (1846), suggested that the increase is inversely proportional to the food. This is only true in the sense that excess and luxury will in some cases injure reproduction. In any other sense the contention is a paradox, and is so treated by Darwin and other leading biologists.<sup>1</sup> Darwin traces his own theory directly to Malthus: "It is the doctrine of Malthus applied with manifold force to the whole animal and vegetable kingdoms, for in this case there can be no artificial increase of food, and no prudential restraint from marriage. Although some species may be now increasing, more or less rapidly, in numbers, all cannot do so, for the world would not hold them. There is no exception to the rule that every organic being naturally increases at so high a rate that, if not destroyed, the earth would soon be covered by the progeny of a single pair. Even slow-breeding man has doubled in 25 years, and at this rate in less than 1000 years there would literally not be standing room for his progeny" (*Origin of Species*, 1859, ch. iii., cp. Wallace, *Darwinism*, 1889, p. 10).

On this power of increase, and on the fact that the offspring always differs though slightly from the parents, is built the theory of natural selection. In the struggle for existence among organisms that cannot all survive, those will survive which have the peculiarities that give them advantage over others. In Mr. Spencer's phrase the fittest will survive. Without discussion of the additions to Darwinism proposed by recent biologists, it may be said that the theory of natural selection in its broad sense

is now an accepted doctrine, and it is applied to human beings in a state of individual savagery as well as, with reservations, to nations of men in relation to each other even when civilised. The individual citizens of nations, however, are to a large extent withdrawn from the crude form of natural selection. Modern states endeavour so far as possible to prevent the trampling out of the weak, but not perhaps so much by State law as by philanthropic agencies; and they do not even forbid the physically weak and sickly to propagate.<sup>1</sup> Hence, though the doctrine of population is in abstract theory only a particular case of a general biological law, the form which that law assumes in the case of man is still recognized as in many ways exceptional.

The protest of W. R. GREG (*Rocks Ahead*, 1874, and *Enigmas of Life*, 1872) and others against the degeneration of type which might seem to result from interference with the struggle for existence, is made more intelligible if we adopt the theory of Mr. Herbert Spencer on "individuation" and reproduction. This theory is that "individuation," including the concentrative intellectual force of a man, can only grow at the expense of the reproductive force.

H. C. CAREY (*Principles of Social Science*, 1858-60) had taught that "the power to maintain life and that of procreation antagonise each other, that antagonism tending perpetually towards the establishment of an equilibrium," animals with large brains being less prolific than animals with small. PROUDHON, *Contrad. Econ.*, had found consolation in a similar equilibrium. But Spencer states the view most carefully: "The forces preservative of race are two, ability in each member of the race to preserve itself and ability to produce other members, power to maintain individual life and power to generate the species. These must vary inversely. When from lowness of organisation the ability to contend with external dangers is small, there must be great fertility to compensate for the consequent mortality; otherwise the race must die out. When, on the contrary, high endowments give much capacity of self-preservation, a correspondingly low degree of fertility is requisite. Given the dangers to be met with as a constant quantity, then, as the ability of any species to meet them must be a constant quantity too, and as this is made up of the two factors, power to maintain individual life and power to multiply, these cannot do other than vary inversely; one must increase as the other decreases,"—*Biology*, vol. ii. pt. vi., "Laws of Multiplication," p. 401, ed. 1867. What is gained for reproduction is lost to nutrition.<sup>2</sup>

<sup>1</sup> The pax Britannica in India has been purchased at the expense of over-population.

<sup>2</sup> Carpenter, in his *Comparative Physiology* (3rd ed. 1881), is quoted by Spencer as writing to the same effect. Spencer's view was stated by himself in the *Westminster Review*, April 1852.

<sup>1</sup> See above (DOUBLEDAY), and compare Dr. C. London's *Solution du Problème de la Population et de la Subsistance* (Paris, 1842), pp. 301-313. His "solution" is "l'allaitement de trois ans."

The growth of the one set of powers is at the expense of the other, most manifestly so in the higher organisms, such as man, where the special organs of individuation, as opposed to genesis, draw to themselves a great amount of the total force in the animal (*ib.* 408, 409).

It must be added that "the inverse variation of individuation and genesis is but approximate. Recognising the truth that every increment of evolution, which is appropriate to the circumstances of an organism, brings an advantage somewhat in excess of its cost, we see the general law, as more strictly stated, to be that genesis decreases not quite so fast as individuation increases" (*ib.* 477). "Every type that is best adapted to its conditions, which on the average means every higher type, has a rate of multiplication that insures a tendency to predominate" (478). The pressure of population in man's case is undoubted, and it is "perennial" (498). It causes "a never-ceasing requirement for skill, intelligence, and self-control; involves therefore a constant exercise of these and gradual growth of them" (499). Excess of fertility is the cause of man's evolution;<sup>1</sup> and the "evolution itself necessitates a decline in his fertility" (501). The getting of food will become harder and harder, and the increased labour will cause a greater and greater diminution of reproductive power (503).

There would thus be an eventual harmony; as with the spear of Achilles, the cause of the mischief would be also the cure of it (cp. Dante, *Inferno*, xxxi. 4).

But it may be doubted whether Mr. Spencer's admissions do not weaken his main argument. In the first place he allows that the struggle for existence meets with interference in the case of men, and has not its perfect work — *Biology*, ii. 487; cp. *Study of Sociology*, ch. xiv. pp. 340 *seq.*, 14th ed. 1888. If domestic animals, such as dogs, are spoiled by their protected state for many purposes of scientific inference, much more so are men in society, and much more so will they become. The dependence of sociology on biology asserted alike by COMTE and Mr. Spencer, is evidently not close enough to enable us to use biological generalisations as necessarily true of human societies, at least in their civilised form. The institutions of modern civilised societies are adapted to preserving the weak and even encouraging their multiplication (see *Study of Sociol.*, *loc. cit.* p. 344).

In the second place Mr. Spencer admits that it is much more easy to support his view in the case of women than in the case of men (*Biol.*, *loc. cit.*, *Study of Sociol.*, p. 379). Now as civilisation preserves the weak of both sexes,

the result would still be that the biologically unfit would survive. No one is better aware than Mr. Spencer that intellectual growth is not necessarily moral; and he would probably allow now, whatever he might have done in 1852, that, after all, a conscious "moral restraint" must intervene if a stable equilibrium is to be produced between population and the means of living.

In the third place it is stated too absolutely that in the long run, owing to the slackened multiplication due to intellectual strain, there will be an adequate instead of an excessive population, and the strain itself will be relaxed. It might obviously be retorted, as it is by Prof. John, *die jüngste Entwicklung der Bevölkerungs-theorie*, 1887, that the multiplication would on Spencer's own principles at once begin afresh, unless, we may add, there had been such a development of morality as to make men keep up from principle the conduct at first enforced by the discipline of necessity.

In any case it seems difficult to avoid the conclusion that there is still scope for the preventive check of Malthus, though not necessarily in the form he preferred; and the severe labour of which Mr. Spencer speaks is not far removed from that class of checks which was called too bluntly by Malthus "misery." Without adopting Spencer's view as an adequate solution of the whole difficulty, we may allow that it concerns a *vera causa*. The higher education of women and their more active part in the intellectual battles of life will, *ceteris paribus*, lead to lessened multiplication; and this in two ways at least: (1) By lessening the dependence of women it will, on the whole, lessen the number of marriages; and (2) for physiological reasons it will lessen the birth rate. Spencer explains the low birth-rate of France mainly by the hard work thrown on French women;<sup>1</sup> but if it be hard *physical* work this would rather involve a high death-rate of infants than a low birth-rate; it is from hard mental work that the latter would more probably come. The stationary state of the French population is admittedly due mainly to deliberate prevention. *A priori* this prevention might be expected to result in a degeneration of type; but there are no conclusive proofs of such an effect at present. When English politicians are providing against the possible opponents of the British nation on the seas or in the battle-field, France is still in the first rank of them.<sup>2</sup>

Incidentally it is a strong confirmation of the Malthusian doctrine that the French settlers in Canada (according to M. de Molinari's article in the *Journal des Economistes*, December 1886, translated in *Statist. Journal*, March 1887) have

<sup>1</sup> Compare his *Sociology*, vol. iii. (1897), p. 361.

<sup>2</sup> M. de Molinari (see *infra*) believes there is physical degeneracy, proves it by the rejections for the army, and ascribes it largely to the forced service itself!

<sup>1</sup> Mr. Spencer frankly acknowledges that, though he came near to Darwin's idea, he did not actually reach it (*ib.* 500 n.).

increased from 60,000 to 2,000,000 in a century and a quarter, while the population of France, but for immigration, is stationary. M. de Molinari (*loc. cit.*) contends that the economic advantages of the present attitude of the mother country considerably outweigh the drawbacks. The low death-rate is to be set against the low birth-rate; the adult population is proportionally a much greater part of the whole than elsewhere, and it is the adult members of a nation that must defend it.<sup>1</sup> On the other hand,—and this argument is supported by C. de Varigny, *Revue des Deux Mondes*, 1st December 1890, *La théorie du nombre en matière de population*,—the sinews of war are in a sense not men but money; great numbers without wealth are less strong than smaller numbers well-furnished.<sup>2</sup> Now France is wealthy; “she exports more capital than she imports” (Molinari, *loc. cit.*); and her immigrants provide her with servants ready made, in place of servants to be reared by herself at great cost.

It will be asked if there is not a danger in the adoption of a policy of restriction, whether (a) by a class within one nation, or (b) by one nation within a large group, in face of competitors who increase as before. This objection recalls the old arguments against the adoption of free trade by a single nation in the face of protectionist rivals. The answer at least is similar; the new policy is adopted because it is a source of strength. The effect of the example of the middle classes has in recent years become appreciable even in this country. The birth-rate has become lower among the working classes (see Reports of Registrar for 1895, London, Lancashire, Durham), and there are reasons for thinking that improved expectation of life, and lessened birth-rate, have exerted a mutual influence. Among nations the position of France in the matter of population is only the most striking instance among many; the phenomenon of lessened rate of increase is becoming general among European nations, and is showing itself in the United States of America. The utilitarian argument (see Prof. Sidgwick, *Politics*, pp. 148 *et seq.*, that the total amount of happiness is greatest where there are most units to be happy) may be answered by the remark, that the intensive happiness may be greatest where the units are not the most numerous; 100 very happy may be better than 1000 only slightly so. The contention that it is dangerous for one nation to begin till all nations are ready, proceeds from that class of reformers who would take no decisive action without a universal consensus. Experience seems to show that reforms usually spread from the parts to the whole, and may begin at once and anywhere.

The bearing of the growth of population on

<sup>1</sup> ἄνδρες γὰρ πόλις (Thucyd.) can receive this new interpretation.

<sup>2</sup> Cp. Quesnay, *Maximes*, apud Daire, *Physiocrates*, i. 101-103.

the relation of working men to their employers will be discussed elsewhere (WAGES FUND). TRADES UNIONS have in practice shown belief in the principle, that the supply of labour must be kept low in order that its value may be kept high. There may remain a doubt whether the immediate economic disadvantage of large numbers, as likely to underbid each other, is not counterbalanced for the nation by the military advantage of them. But the military advantage depends largely on the financial resources; and, if the military struggle were over and the large numbers had vanquished, the problem that troubled Godwin and Malthus in 1798 would present itself again. Even in the best of all possible societies there is no room for unlimited increase. This has been clearly seen by many of the leading advocates of socialism; and the Malthusian theory of population is only fatal to socialism on the assumption, which is not justified, that all socialists are blind to it.

[*Bibliography* (in addition to the works cited in the text). The subject is discussed more or less fully in almost all English text-books of political economy, most fully in those of J. S. Mill<sup>1</sup> (for the classical doctrine), Professor Marshall (for modern facts in 3rd ed. of *Principles*), and Professor Nicholson (for careful re-statement). In French there is still nothing to surpass *Du Principe de Population* of Joseph GARNIER, 4th ed. 1857. The article “Population” by Garnier and Legoyt in the *Dictionnaire de l’Économie Politique* of 1853 is masterly, and its bibliography is excellent. It may be supplemented for German writings by the *Handwörterbuch der Staatswissenschaften*, art. “Bevölkerungslehre und Bevölkerungspolitik,” by Dr. Elster; and for Italian by the *Bibliografia* of Cossa and Bertolini (*Giornale degli Economisti*, 1891-94).

*A Reply to the Essay on Population in a series of Letters*, Anon. [W. Hazlitt] 1807. The first three letters had appeared in Cobbett’s *Polit. Register*. Hazlitt thinks “the extent of population is only limited by the extent of the earth;” “the difficulty is not in making more land maintain more men, but in making the same spot of ground maintain a greater number than it did before” (36, 37). In short, he concedes it only in the case of intensive cultivation and diminishing returns.—James Grahame, *An Inquiry into the Principle of Population, including an exposition of the causes and the advantages of a tendency to exuberance of numbers in society, a defence of Poor Laws*, etc. (Edinburgh, 1816). Answered by Malthus in Appendix to his *Essay*, ed. 1817.—George Ensor, *An Inquiry concerning the Population of Nations, containing a refutation of Mr. Malthus’s Essay on Population*, Part I, London, Ellingham Wilson, 1818. Ch. vi. brings out the difficulty of estimating population without a census, by hearth money, etc. (cp. pt. 3, ch. vi.). The book is rather a plea for political reforms than

<sup>1</sup> Mill’s famous paradox that it is doubtful if machinery has lightened human labour, is expressly founded on the Malthusian theory (see *Pol. Econ.*, bk. iv. ch. vi., on the stationary state).

an economical argument.—*An Enquiry into the Principles of Population, exhibiting a system of regulations for the Poor, designed immediately to lessen and finally to remove the evils which have hitherto pressed upon the Labouring Classes of Society*, Anon., London, 1832. The labourers have put themselves at disadvantage by increasing too fast. But chemistry can make food out of sawdust and dry bones (p. 60), and the real desideratum is a better adjustment of labour. The higher classes must be educated to do more for production, and the labourers should learn to "shape work for themselves, and depend less on the capitalist" (ch. viii.).—Robert Dale Owen, *Moral Physiology, a brief and plain Treatise on the Population Question*, 8th ed., 1832. Perhaps the most temperate of the books written to recommend the Neo-Malthusian view of the subject.—Rev. W. F. Lloyd, Professor of Political Economy, Oxford, *Two Lectures on the Checks to Populations*, Oxford, 1833. Some very acute economic observations.—Travers Twiss, Professor of Political Economy, Oxford, *On certain Tests of a Thriving Population*, London, 1845. A thoughtful and useful statement of general principles both economical and statistical.—Among the best recent books on the subject of population are: Kautsky, *Der Einfluss der Volksvermehrung auf den Fortschritt der Gesellschaft*, 1880.—Lexis, *Bevölkerungs-statistik*, 1875 (for mathematicians). (Compare *Die Theorie der Massenerscheinungen in der menschlichen Gesellschaft*, by the same author, 1877).—Heinrich Soetbeer, *Die Sozialisten und die Malthus'sche Bevölkerungstheorie*, 1886.—Dr. A. Südekum, *Ueber das Malthus'sche Gesetz und das Bevölkerungsproblem der kommunistischen Gesellschaft*, Kiel, 1894.—Vitt. Lebrecht, *Il Malthusismo e i problemi sociali*, *Saggi critici*, 1893.—Nadailac, *Affaiblissement de la natalité en France, ses causes et ses conséquences*, 2nd ed., 1886.—G. B. Longstaff, *Studies in Statistics*, 1891.—Professor van der Smitten, *La Population*, 1893 (unnecessarily long).—Professor Levasseur, *La Population Française*, 3 vols., 1889-92.—Dr. J. B. Haycraft, *Darwinism and Race Progress*, 1895.

Among pamphlets and articles may be mentioned—

Dr. W. Ogle, "The Marriage-Rates and Marriage-Ages, with special reference to the Growth of Population," *Statist. Journal*, June 1890 (recommends retardation of marriage;—women should marry five years later than they do now). R. H. Hooker, "Is the Birth-Rate still falling?" *Manchester Stat. Journ.*, January 1898.—F. S. Crum, "The Birth-Rate in Massachusetts" (*Quarterly Journal of Economics*, April 1897).—Castelot, "Théories de la Population en Allemagne (from 16th century), *Journal des Économistes*, 15th May 1895.—Dr. W. Cunningham, British Association, Southport, "On the Statement of the Malthusian Principle," 1882.—A. T. Lyttleton, "The Question of Population," *Economic Review*, April 1891 (one of the best recent English surveys of the whole discussion).—Professor V. John, *Die jüngste Entwicklung der Bevölkerungstheorie*, Internationaler Congress für Hygiene und Demographie, Vienna, 1887.—G.

Lagneau, *L'Immigration en France*, 1884.—Father Fortin, "Les derniers renseignements officiels sur les mouvements de la Population en France," *Études Religieuses, Philosophiques, Historiques, et Littéraires*, for March, April, June, August, October 1895.—Father Clarke, "New Malthusianism" (*North American Review*, September 1896).—*Encyclopædia Britannica* (9th ed.), art. "Reproduction," by Professor P. Geddes (in connection with Mr. H. Spencer's theory).—J. M. Robertson, "A hundred years of Malthusianism," *University Magaz.*, October and November 1897.

Mention should be made of the *Recueil des Mémoires Académiques de M. l'Abbé Mann*, Bruxelles, 1778-83, 4to, especially the mémoire; *Sur les moyens d'augmenter la Population et de perfectionner la Culture dans les Pays Bas Autrichiens*, 5 Avril 1775, p. 71: "Le degré de la population suit la mesure de la subsistance; ainsi plus on fait rapporter à la terre plus on la peuple." But MANN does not push the principle far.] J. B.

POPULIST MOVEMENT IN THE UNITED STATES. The populist or people's party in the United States dates as a separate organisation from the year 1889, when delegates from the FARMERS' ORGANISATIONS in the U.S. and the Knights of Labour met at St. Louis and passed resolutions supporting, among other proposals, the free coinage of silver and the government ownership of railways. The next year (1890) another convention was held at Ocala, Florida. The "platform" adopted was very similar to that of 1889, the principal change being that "government control" of railways was substituted for ownership. A meeting at Cincinnati followed in 1891, when other political "planks" were introduced, as, abolition of national banks—election of president, vice-president, and senators by direct vote.

The convention at St. Louis in February 1892 modified this "platform"—abolition of national banks, direct election of president, vice-president, and senators were omitted; instead of government control, government ownership of railways was re-instated.

The next convention was at Omaha, July 1892. "Free coinage of silver, a minor clause on abolition of national banks, a sub-treasury scheme, or some similar system, a graduated income-tax, plenty of paper money, government ownership of railroads, election of senators by direct vote of the people, non-ownership of land by foreigners, revenue of state and nation limited to expenses, eight hours' work, postal banks, pensions, and prohibition of the present contract law and immigration system, these were the measures advocated."

The St. Louis platform of 1896 was on very similar lines to the Omaha platform of 1892. The address introducing it is full of overstatement. The nation is described as being "brought to the verge of moral, political, and material ruin." Corruption dominates, the people are demoralised, mortgages cover their homes, labour is impoverished, the land concentrated in the hands of the capitalists. Of the "platform" itself the more important "planks" refer to "currency, re-establishment of silver, government ownership of railroads, and the limited ownership of lands."

The expansion of the currency is desired, by the free coinage of silver and the increase of the currency to at least 50 dollars (£10) per head. But more important than this is the proposal for "cheap money, unlimited in amount and issued on land and other securities." Those who support these projects confound "money" with "capital"—they hope that "an ample and cheap currency will mean capital easily secured." Depreciation, however, is sure to follow as the "money" has no substantial basis.

"Prices go down, confidence is destroyed, and a financial crisis crowns the inflation. Such has been the experience of the past, such will be that of the future." These are the words of Mr. Frank L. McVey, from whose very clear description of the "Populist Movement" in *Economic Studies*, *American Economic Association*, August 1896, this statement is derived. Mr. McVey does full justice to the honesty of intention of the "rank and file" of the movement, but he cannot extend this feeling to all concerned. He regards the party as in a transient state and likely to be absorbed by the new silver party. Its success in the past since 1891 has been almost phenomenal, "but that success does not, under existing circumstances point to any probable future success."

PORPHYRY (A.D. 233-A.D. 303?), a Neo-Platonist philosopher and Aristotelian logician, concerns economists in respect of the principle of bilateral division which has been associated with his name. A diagram illustrating a series of such sub-divisions has been designated a "tree of Porphyry." This logical device is no doubt conducive to perspicuity of arrangement. Jevons regarded the bifurcate classification as the "foundation of all strict scientific

method" (*Principles of Science*, vol. ii. p. 381), and classes the authority of Bentham as supporting this (*ib.*). In this opinion Jevons probably went fully far. In economics, as in other sciences, a plural rather than a dual division is sometimes best adapted to bring out essential properties.

F. Y. E.

PORTAZGO, PONTAZGO, AND BARCAGE, tolls paid by travellers in Castile as a right of passage on the king's land. They were generally levied on the ways leading to fairs and markets. In Aragon they were called *Peage*.

E. ca.

PORTER, GEORGE R. (1792-1855), economist, married the sister of RICARDO. A paper on life assurance, which appeared in Knight's *Companion to the Almanac* for 1831, led to his receiving an appointment, the following year, in the Board of Trade. On the organisation of the statistical department of that office, Porter was placed at its head, becoming, besides, in 1840, senior member of the railway department. In the following year he was promoted to be one of the secretaries. Porter was one of the founders of the Statistical Society, to the journal of which he was a frequent contributor. In 1836 he published the two first sections, on population and production, of *The Progress of the Nation in its Social and Commercial Relations, from the Beginning of the Nineteenth Century to the Present Day*, London, 12mo. Sections three and four, dealing with interchange, and public revenue and expenditure, followed in 1838, and the final portion, treating of consumption, accumulation, moral progress, and the extent and condition of our colonies, in 1843. New editions, bringing the figures down to date, were issued in 1846 and 1851, 8vo. *The Progress of the Nation*, has been termed "an invaluable record of the first half of the nineteenth century. It is remarkable for the accuracy and variety of its information, and for the skill with which the results of statistical inquiry" are dealt with. It is written in an optimistic spirit, characteristic of the time of its appearance. Free trade and popular education are, throughout, regarded as the sure heralds of an industrial paradise (see LAISSEZ-FAIRE). In 1846 Porter published a translation of Bastiat's *Popular Fallacies regarding General Interests* (see BASTIAT, F.), London, 16mo. He also wrote *The Effects of Restrictions on the Importation of Corn, etc.*, 1339, 8vo.

POSITIVE LAW is nearly always used, in distinction from natural law, to indicate the enactments or decrees of a recognised authority. It is law laid down by man in the concrete, and may be either in agreement with the supposed law of nature or at discord with it. Lorimer, Ahrens, and generally speaking the jurists of the school of Krause, insist that the proper use of the term is in the sense of concrete embodiments of the natural law, in which case only the enactments in harmony with the law of nature could receive the name,—not “law as it is,” except in so far as that is “law as it ought to be,” but these writers wish to give an entirely new and unfamiliar meaning to a well-known term.

[Distinction in Grotius, *De Jur. B. et P. Proleg.*, 40. 17.—Wheaton, *Internat. L.*, 3rd Engl. ed., ed. A. C. Boyd, London (Stevens), 1889, pp. 4 seq.—Holland (Prof. T. E.), *Elements of Jurisprudence*, 8th ed. Clar. Press, 1896, ch. iv. : *Positive Law*, pp. 37 seq., cp. iii. 33, etc.—Lorimer, James, *Institutes of Law*, 2nd ed. 1880, pp. 8 seq.—Green, T. H., *Works*, vol. ii. pp. 399, 400.—Austin, John, *Jurisprudence*, ed. 1832, lect. v. pp. 130, 131.—Bluntschli, *Staatsrecht*, ch. vii. note, quotes Melancthon, *Philosophia Moralis*, for the narrower use of the words.]

J. B.

POSITIVE THEORY OF CAPITAL. This is the title of the second of Prof. Böhm-Bawerk's volumes on capital, the first having been negative and critical (“History and Criticism of the Theories of Interest on Capital,” 1884). It appeared in 1889. Capital is defined as “products which are the means for the making of other products,” and interest is explained by the difference between the value of goods now present, and the value of goods still future, present goods having *ceteris paribus* the higher value.

[For a sketch of the theory, see the Harvard *Quarterly Journal of Economics*, April 1889, and, for exposition and illustration, see Prof. W. Smart's preface to his translation of the Positive Theory, (Macmillan, 1891).]

J. B.

POSITIVISM. It would not be possible, within the space here available, nor indeed would it be appropriate in this place, to attempt a complete account of a vast and many-sided system of thought, comprising a synthetic view of the several fundamental sciences, a theory of history, and a moral and religious doctrine. It is in the works of Auguste COMTE (*g.v.*) that positivism must be studied by those who wish to understand it as a whole. We shall only endeavour to exhibit in outline his estimate of political economy, and his view as to the systematic regulation of industrial society and the nature of the reform which its existing condition requires.

A letter to Gustave d'Eichthal in 1825 shows that Comte had early occupied himself with economic questions, and warmly sympathised with the efforts of English statesmen to remove restrictions on trade. In his *Philosophie Positive*, when treating the subject of sociological method, he entered on a criticism of the economists of the time. He censured them on grounds the most important of which have since been reduced to the following heads—(1) the isolation, in their investigations, of the material aspect of society from its intellectual, moral, and political aspects, neglecting the consideration of the consensus, and mutual action of the several social elements; (2) the metaphysical, or viciously abstract, way in which their doctrines were presented; (3) their immense exaggeration of the office of deduction in their researches; and (4) their want of relativity—the too absolute and unhistoric character of their conclusions, which often assumed that economic phenomena were identical in all stages of social development. Comte would be the first to admit that in some, at least, of these respects a marked tendency to reform, due in part to his own influence, has manifested itself since he wrote.

But whilst pointing out these vices, especially of method, into which writers on the subject had fallen; he fully acknowledged the “eminent services,” to use his own expression, which political economy had rendered. Its beneficial work was twofold. In the first place, it acted powerfully in discrediting the old social and political system by proving, even to the satisfaction of existing governments themselves, their radical inaptitude for directing the industrial movement. This influence he recognised as having been exercised in a special degree by the “immortal work” of Adam SMITH, which he singled out for special commendation. These negative tendencies were, however, he thought, carried much beyond the needs of their essentially temporary destination; and the exaggerations of the less large-minded members of the school went so far as to consecrate a public state of non-government and a personal spirit of individualism. Sometimes a more rigid DOCTRINAIRE (*g.v.*) even denied the necessity of any regular moral instruction, and proposed the suppression of all state aid to art and science—and the more recent assaults on the fundamental institution of property had set out from principles maintained by recognised leaders in economic theory.

Besides its negative action, which within just limits was provisionally indispensable, political economy had done valuable service by fixing the attention of speculative minds, as well as of statesmen, on the social importance of the industrial character which distinguishes modern from ancient civilisation (see CITY—ANCIENT, MEDIEVAL, MODERN), and thus giving prominence to the idea of social progress. But as long as the attempt should be made to treat the material existence of societies apart from the

other elements of their life, he held that no genuinely scientific theory of the subject could be constructed, and that only indirect and partial lights could result from such an effort. Economic studies must be absorbed into the larger science of SOCIOLOGY (*q.v.*), or at least must be conducted under its permanent presidency and control.

Proceeding now to the practical question of industrial regulation, we have to recognise at the outset that we cannot by ever so unanimous a vote alter the nature of things or of men, or change the general direction of human development. The true character of the world we live in is expressed by the phrase "modifiable fatality"; the main course of events, social as well as physical, is beyond our control, and the possible range of minor modifications is strictly limited by natural law. The first requirement in social action is to have at our command a scientific exposition of the constitution and evolution of society, and this positivists affirm to have been given by Comte,—the theory of development, the most essential as well as the most difficult branch of sociology, having been once for all established by his law of the three states and his hierarchical arrangement of the sciences, followed by his laws of the historical progress of moral sentiment and practical activity. The order of things instituted by man must be simply a consolidation and improvement of the natural order spontaneously arising from the action of these and other social laws. This principle condemns all the socialistic schemes which have been propounded for placing industrial life on essentially different bases from those which have been gradually elaborated in the course of history; so that, whilst they would be subversive and anarchical if realised, they are, in fact, incapable of more than a brief existence under an impulse of revolutionary violence. But, further, they are delusive when considered with a view to the interests of working men. No partial and merely material schemes can solve the social problem. The questions most important for the working classes are, in their nature, moral rather than political. Accordingly, positivism substitutes for the stormy discussion of rights the peaceful determination of duties, and for disputes respecting the possession of power, a study of the rules which should regulate its employment. What positivists believe to be wanted is not a violent change in existing social arrangements, but a regeneration of opinions and habits due to a general adoption of the religion of humanity, which embodies the real laws of society and teaches the true nature of the several social relations. The effect of this would be the foundation of a new spiritual order, renouncing all wealth and temporal power, proclaiming in general principle, and declaring in individual cases, the duties of each class, on the basis not of chimerical opinions but of a demonstrable social doctrine. From the nature of modern society one primary office of such an order would be to stand between the capitalist and the workman, enforcing by moral means the just claims of each. The calm but energetic action of such a body would satisfy the poor, whilst reassuring the rich, and, without disturbing the essential institutions

which exist as the result, whether of natural law or of historical causes, would inform them with a new spirit, and gradually and peacefully modify them as might be necessary. The working classes are, and, except in very special contingencies will always be, unfit to take part in the direct government of society, or to decide finally on political measures; and, such an office, if it were assigned to them, would tend to corrupt them without furthering their real welfare. In the system now indicated, their public function, as distinct from their professional occupations, would be to support the new spiritual order by the force of opinion in the difficult work of controlling the exercise of material power, whether in the form of wealth or of numbers, by the continuous application of a rational moral doctrine already accepted by the community. This solution, it will be seen, amounts to the reconstruction, on better bases and in a more favourable situation, of the division of the temporal and spiritual powers, empirically pursued and partially realised in the middle ages (see AQUINAS; CANON LAW). The spiritual authority so established, resting only on intellectual and moral influences, subject to full discussion, and depending on the laity for its maintenance, could not be oppressive. It would not merely improve the relative conduct of classes within each state, but would systematically apply moral considerations, where they are now so much needed, to the mutual relations of different political communities. The more these great questions are studied, the clearer it becomes that the only solution which is neither illusory nor degrading is the moral one, which would insist, through a suitable organ, on the subordination, not of wealth only, but of all individual powers and endowments to the continuous service of humanity. The necessity of such a function is universally recognised, but many continue to ignore the obvious truth that every social function requires an appropriate organ. What has been said sufficiently indicates that positivism does not sympathise with the collectivists (see COLLECTIVISM), or any other party aiming at the elimination of the ENTREPRENEUR (*q.v.*), an impracticable, as well as a mischievous, programme. The rise and progress of a type of society essentially devoted to industry secures to the chiefs of that form of activity an ultimate political ascendancy, which they would, indeed, have already attained if they had set themselves, following the example of the best among them, to govern the working classes, instead of exploiting or deserting them. They are to be regarded, as are also their workmen, as public functionaries; their special office being that of preserving, increasing, administering, and transmitting the social capital. Their employment of this capital, though requiring to be morally regulated as we have described, should not, except in extreme cases, be the subject of legal control. Without the guarantee of a just security, they cannot perform their functions aright. Positivism favours, instead of opposing, the concentration of wealth in the hands of the active rich—as increasing the power available for social ends, whilst more visibly fixing responsibility for its

proper use—subject, however, to the condition that the extent of the industrial administration of each capitalist ought not to exceed his capacity of personal supervision.

Of the further prescriptions of positivism affecting the industrial world, which may be studied in the *Politique Positive* of Auguste Comte, the only one which we can mention here is that of the withdrawal of women from non-domestic labour, so that they may be altogether devoted to their proper social duties—the economy of the household, the care of the health and comfort of its inmates, and the early education of the young, especially the cultivation of their affections and the formation of their habits.

[See COMTE, Aug. ; COMTE, AUG., AND ENGLISH POLITICAL ECONOMY. See also Littré's *Auguste Comte*, 1864. The later positivists do not all follow Comte in rejecting political economy, and Littré does not.] J. K. I.

**POSSESSION ; POSSESSIO**, when used without any technical meaning by Roman legal writers, signifies the mere fact of physical control of a thing. *Possessio*, in a legal sense, is physical control of a thing either by oneself or by one's agent, to which the law attaches special legal consequences. Possession of this kind, which may be called legal possession, is simply matter of fact, not of right or title to possess (*possessio in facto non in jure consistit*). Hence a person may have legal possession of a thing, while some one else has the right to such possession, though the latter may vindicate his right in an action based on proof of title.

Thus a thief may have legal possession of the property of another, as against the world in general.

The special consequences which may attach in Roman law to possession are of two kinds.

(1) Possession is protected by means of interdicts (see *INTERDICTUM*) against arbitrary disturbance on the part of any one, including the owner of the thing, except that the possessor cannot maintain such an interdict against a person from whom he has taken possession by violence or by fraud or by his leave and licence (*vi. clam, precario*).

(2) Possession for the time defined by law gives rise, under certain circumstances, to a title of ownership by usucapion (see *USUCAPIO*) or prescription (see *PRÆSCRIPTIO*). E. A. W.

**POST.** See **POST OFFICE, THE**.

**POST OFFICE, THE.** English postal history begins about the middle of the 16th century. Events forced Henry VIII. and his successors to maintain an organised service for despatches. Increasing trade led the foreign merchants to institute a service to the continent, and their jealousies placed its control in the hands of the government. Thus in 1558 Thomas Randolph united the mastership of both posts. By the provision of horses at fixed points all travelling and correspondence were made easier. A monopoly increased the effectiveness of the service, and the control of correspondence thus secured became a valued instrument of government.

Its utility and necessity were openly avowed until the restoration, and fully realised by Charles II. and James II.

In 1635 the posts within the kingdom were opened to private letters on the proposal of Thomas Witherings. The growth of correspondence probably made such a step necessary to maintain government control. A monopoly on existing postal routes was proclaimed and secured by cheap rates as much as by law. For a single-sheet letter only 2d. was charged for 80 miles or less, and 4d. up to 140 miles. Beyond this, 6d. was charged, and 8d. to Scotland. No profit was expected, but a reduction of expense by about £3000. In 1640 the parliament dismissed Witherings, and a struggle for control of the post office ensued. In 1644 Edmund Prideaux became postmaster. Until 1650 he worked at his own cost, taking the postage. He opened new posts, and in 1650 a rent of £5000 a year was wrung from him. Since then the post office has always been a source of revenue, and frequently administered in that character only. In 1653 Prideaux ceased to be postmaster, and the office was "farmed" for £10,000 a year. The profits were estimated at from £14,000 to £20,000 a year. This revenue was from the postage on letters only, though the monopoly of letting post-horses secured postmasters at low salaries, and so reduced the cost of working.

In 1657 the first post office act of parliament was passed. It reduced the rate beyond 80 miles to 3d. for England and to 4d. on letters to Scotland. It fixed the charge to the public for post-horses at 2½d. a mile for each horse, and "a guide groat for each stage." In 1660 a new act repeated most of the Commonwealth act, and forbade the carriage of mails in ships not built in England and navigated by English crews. Private posts of three years' standing were to be taken over and their organisers rewarded. From 1660 the post office was farmed for £21,500, and in 1667 this was increased to £43,000. In 1663 the revenue of the office was assigned to the Duke of York, and in 1677 he took the management into his own control instead of "farming" it. On his accession in 1685 the revenue was estimated at about £65,000. Thenceforward it became a part of the personal revenues of the sovereign, and subject to that minute exchequer control which has always marked its administration. From 1688 to 1691 the payments into the exchequer averaged £50,000 a year. In 1695 they were £63,000, and in 1700, £77,384. They represent the net revenue after deducting all charges, and are the only index of the volume and growth of correspondence.

Throughout its history the post office has at once encouraged, absorbed, and suppressed private enterprise. In the 17th century bad roads and slow communication made it difficult

for a central administration to extend its system. Hence locally managed branch posts were necessary, but when these were established a desire to increase revenue and government control, as well as to simplify the system, led to their absorption. The same motives led to the suppression of competing private posts. In 1649 a post, established by the corporation of London, was suppressed by Prideaux. In 1680 William Docwra took over a small business of collecting and delivering letters in London and Westminster. He opened many offices and employed a large staff in delivering letters and parcels up to 1 lb. in weight and £10 in value, with free insurance, at a charge of 1d. each. In 1682 proceedings were taken against him for infringing the royal monopoly. Docwra pleaded that as no local post existed in London he was not competing with the official posts; but the king's bench held that the monopoly extended to all places except those lying off the lines of posts. A nominal fine was imposed, and the system taken over by the post office. It was worked tolerably well, though probably not so well as by Docwra, and the case illustrates in its details the conflict of monopoly and private enterprise. The penny post, which as late as 1801 became the twopenny post, existed as a separate branch in London until the introduction of uniform penny postage. In 1709 an attempt was made by Charles Povey to set up a halfpenny post in London, but it was promptly suppressed, and no other serious attempt was made to challenge the postal monopoly until 1869, when the operations of the Circular Delivery Co. were pronounced illegal. In 1890 two messenger companies, who included in their work the special delivery of letters, were compelled to pay a royalty to the post office, and the monopoly remains in active force. It covers the collection and delivery of letters, except letters sent by a servant, friend, or person specially employed by the sender. Its defence is that by its aid a cheap uniform service is maintained in remote districts, such as would be impossible if private enterprise were allowed to occupy the more profitable centres; but even so protection within these areas needs to be carefully limited if it is not to check the elaboration of social enterprise.

Towards the close of the 17th century, and for the first twenty years of the 18th, the network of posts was extended by contracts given to many private persons. In 1720 Ralph Allen, the most distinguished of these contractors, then postmaster of Bath, made a general contract for the establishment of "cross-posts," i.e. posts crossing from one post-road to another. He received the postage on letters he carried, and paid all his expenses and £6000 a year to the government. His contract was renewed from time to time until his death in 1764, and he opened many new posts at his

own cost, besides giving a daily post on many of the main lines. This he did in preference to increasing his payment to the exchequer, and his enlightened policy brought an ample reward. In 1761 his accounts showed a profit of £12,000 per annum. Allen's distinction in other ways is well known, but his work in the post office is worthy of all praise, and ranks him with Rowland Hill.

In 1784 John Palmer, also a citizen of Bath, organised the mail-coach system. Previously mails were carried by mounted post-boys, who were constantly being robbed. Insecurity had altogether destroyed the efficiency of the service for business purposes. The new coaches with armed guards were practically exempt from robberies, and the increase of correspondence was enormous. Palmer was promised 2½ per cent on the net revenue beyond £50,000, but the government soon tired of its bargain and forced on him a pension of £3000 a year. In 1813, after a prolonged discussion in parliament, a grant of £50,000 was made to him.

The 18th century was marked by the growth and abuse of the "franking" privilege enjoyed by members of both houses of parliament. In 1716 franked letters were estimated at 17,500 a year. In 1763 their postal value at current rates was £170,000 or nearly twice the net revenue. In 1764 a reduction of some £30,000 a year was made by an act requiring the whole address to be in the same writing as the "frank." Successive governments tried to reduce the burden, but it was not extinguished until 1837.

The growth of the revenue of the post office, and of the volume of correspondence, from 1724, is shown by the following table. From 1704 to 1713 the average net revenue was £67,000, and from 1714 to 1723 about £93,000. The increase was due chiefly to an increase of rates in 1711.

Years.	Gross Revenue.	Expenditure.	Percentage of Cost.	Net Revenue.
1724-1732	£177,492	£81,400	£46	£96,002
1734-1743	187,348	94,175	50	93,173
1744-1753	205,480	115,764	56	89,716
1754-1763	234,121	146,210	62	87,911
1764-1773	278,960	121,713	44	157,247
1774-1783	359,984	209,176	58	150,808
1784-1793	517,434	209,061	40	308,373
1794-1803	961,223	333,506	35	621,627
1804-1808	1,453,082	419,980	29	1,033,102

The variations in expenditure in the earlier decades were due to the loss of packet boats, and other war expenditure. The increase of revenue from 1764 was due to the diminution of "franks," the growth of trade, and the absorption of Allen's "bye-posts." The enormous growth of revenue from 1784 was owing to Palmer's mail-coaches, and the growth of trade. The increase in net revenue is remarkable. Successive increases of postage rates are considered to have produced little or no increase of revenue.

The early years of this century were marked by

stagnation. In 1839 the revenue was less than in 1814. High rates checked correspondence or diverted it to irregular channels. On the 10th January 1840, Rowland Hill's plan of uniform penny postage was introduced after much resistance. The number of letters increased in a year from 82 to 169 millions, but the net revenue fell from £1,600,000 to less than £600,000. This was partly due to an over-sanguine estimate, but more to the substitution of costly railway conveyance for carriage by mail-coaches, the expense of which was very small, and had been treated by Rowland Hill as an almost negligible quantity. Besides the reduction of cost an improvement in the quality of the service had to be given.

Hill had relied on the substitution of pre-payment, made easy by the device of adhesive stamps, for payment on delivery, to save the cost of complicated treatment and accounting, but the public at first regarded pre-payment as an insult to correspondents and were slow to adopt it. In former days pre-payment would have been fatal to safety, and only a system of hand-to-hand accounting more elaborate than our present system of registration, with payment by the addressees, could secure delivery. The saving due to pre-payment illustrates well the commercial value of the honesty which makes the system possible.

Since 1840 the chief changes in the letter post have been in the increase of the limits of weight. In 1871, 1 oz. instead of  $\frac{1}{2}$  oz. was allowed for 1d. and in 1897 the limit has been raised to 4 oz. In 1870 halfpenny post cards were issued, at first at face value, but in 1871, in deference to an outcry of the stationers, a charge of  $\frac{1}{2}$ d. for 12 was added for the material. In 1894 private cards were allowed to be used with adhesive stamps. In 1883 reply post cards were issued.<sup>1</sup>

The book-post was instituted in 1848 for the encouragement of education and literature. The rate of 6d. a pound was reduced in 1855 to 1d. for 4 oz., 2d. for 8 oz., and 2d. for each additional half pound. In that year 3 million book-packets were posted. In 1856 circulars were admitted to the book-post. In 1866 a rate of 1d. for every 4 oz. was introduced, and in 1870 a rate of  $\frac{3}{4}$ d. for every 2 oz. The post has also been extended by widening the definition of articles transmissible, and has in 1897 been practically absorbed in the letter post, except for packets of less than 2 oz., by the assimilation of rates.

In 1862 a special rate was allowed for patterns sent abroad, and in 1863 for patterns sent by inland post. In 1870 the rate for patterns and samples was made the same as for books, but in 1871, on a reduction of the rates for heavy letters, the pattern post was abolished from the difficulty of distinguishing genuine patterns from other small packets. In 1887 it was re-established, but it has now also, by the assimilation of rates, been absorbed in the letter post.

<sup>1</sup> In 1890 railway companies were allowed to accept single letters for transmission by train for a fee of 2d. on each letter in addition to postage. This service may be used either as an alternative or as a supplement to the ordinary post. In 1891 the post office undertook the delivery of letters and parcels by express messengers, employed either for the whole course of transmission or on arrival by post at the terminal office.

The newspaper post had its origin in the 17th century, when "the clerks of the roads" were allowed to frank newspapers, and thus became the chief newsagents. Many newspapers were also sent under other franks, and practically none paid postage. In 1825 newspapers were allowed to pass free by act of parliament, but they were still charged with a stamp-duty, which was compulsory till 1855, and was accepted as an equivalent of postage until 1870, when the rate of  $\frac{1}{4}$ d. for each registered newspaper was introduced.

The parcel post was established in 1883, and since 1885 has been extended to nearly all parts of the world except Russia and the United States, which have no internal parcel posts. The high charges of the railways for parcel mails has led to the extended use of road coaches for this service. The economic advantages of the parcel post—e.g. to the agricultural districts in the cheap and expeditious carriage of agricultural produce—are scarcely yet developed.

In 1841 the registration of letters was begun, with a charge of 1s. for each letter. No compensation for loss was given. In 1847 the average number of registered letters sent by the night-mails from London was only 320. In 1848 the fee was reduced to 6d. In 1853 letters for the colonies and abroad were first registered. In 1864 the fee was reduced to 4d., and in 1878 to 2d., with compensation for loss up to £2. In 1886 a system of insurance up to £10 was introduced. In 1891 the limit was increased to £25, and in 1892 to £50. In 1886 the insurance system was also extended to parcels.

In the present century the post office has assumed three new functions—the transmission of money, and telegrams, and the custody of savings. These are alike only in requiring a widespread system of branch offices. In 1792 the "clerks of the roads" at the general post office were allowed to issue money orders as a private venture. In 1798 the business was transferred to Barnes and Stow, two officials, from whose successors it was taken over by the post office in 1808. In 1839, 188,000 orders were issued at rates of 6d. for £2 and 1s. 6d. for £5. In 1841, when the rates were 3d. and 6d., one and a half million of orders were issued. In 1862 the maximum amount was raised to £10, with a commission of 1s. In 1871 a graduated scale of charges, rising by pennies, was introduced, and 12,000,000 orders were sold. In 1877-78 the number reached its maximum of 18,000,000. The increase was checked by an increase of rates in 1878, and in 1881 by the introduction of postal orders which have superseded to a great extent money orders for less than £1. Recently there has been a steady increase of orders for higher amounts. In 1855 money orders were first sent abroad to the Crimea, and the system was gradually extended to the colonies. In 1869 a money order convention was made with Switzerland, and since then others have been made with practically every civilised state. In 1889 money orders were issued as an experiment by telegraph between London and seventeen large towns, and the system has since been extended to all money-order offices. The post office "money" order is a restricted form of cheque which offers security as its chief advantage. The postal

order is a bank note with a time limit to currency. Its chief disadvantage is the risk of loss and the temptation to dishonesty of post-office servants. Their enormous utility, chiefly to retail trade, is shown by the sum £55,075,961, transmitted in 1896-97 by means of these two kinds of orders.

In 1870 all private telegraphic undertakings except certain cable companies were purchased by the government for £10,130,000, and a strict telegraphic monopoly established. It covers the transmission of electric signals with or without the use of wires, and even more. In 1869 the charges for telegrams of twenty words varied from 1s. to 6s., according to distance, with a local charge of 6d. in London and some other large towns, covering about 2 per cent of the total number of telegrams. The total number of offices open was about 2000, but many of these were competing offices clustered in busy centres. Many towns of from 3000 to 6000 inhabitants were from five to ten miles from an office. The use of the telegraph was a luxury confined to certain classes. The expense and difficulty of sending telegrams limited public use. These results represent the development of telegraphy by commercial enterprise in about twenty-five years. Upon the transfer to the state a uniform rate of 1s. for twenty words with free addresses was given. Within two years 2200 new offices were opened. In 1869 the total number of telegrams was less than 7,000,000. In 1870 it rose to 10,000,000, and in 1872 to about 15,000,000. In 1884-85 the number of telegraph offices was 6000, and the number of telegrams about 33,000,000. A new rate of 6d. for twelve words including addresses was introduced, and in 1886-87 the number rose to 50,000,000. The average payment for a telegram fell from 1s. 1d. to 8d. The revenue, which in 1884-85 was £1,755,118, increased by only £3000 in 1885-86, while the number of telegrams was increased by 6,000,000. The traffic in large towns was especially stimulated by the change. In London local telegrams increased from 1,800,000 in 1884-85 to 3,800,000 in 1886-87. The growth of the telegraph service has since proceeded rapidly in all parts of the kingdom, though the business is one that is especially sensitive to commercial depression. Since 1878 a keen competition has grown up between the telephone and the telegraph. In many cases their functions are different, but the telephone undoubtedly takes the place of the telegraph in local communications. At an early date a decision was obtained that the transmission of messages by means of telephones is an infringement of the telegraphic monopoly, and since then all telephone companies have paid a royalty of 10 per cent on their earnings to the post office. The protection of a more cumbersome system at the expense of a more convenient system, even though the former has been acquired by the state at great cost, appears to be open to serious economic objections, though the present arrangement may be defended on other grounds.

The amount paid by the state for the telegraphs has often been said to be excessive, but it must be remembered that it represented not merely the actual value of the plant and business acquired, but also all future possibilities. The telegraphs

have not been financially successful in the hands of the state, but even this result is exaggerated in appearance by the inclusion of all capital expenditure with the annual expenditure. A. M. O.

See POST OFFICE in Appendix.

POSTLETHWAYT, JAMES (d. 1761), perhaps a brother of MALACHY POSTLETHWAYT, wrote *The History of the Public Revenue from the Revolution in 1688 to . . . Christmas 1758*, London, 1759, 4to. He published *Collection of the Bills of Mortality from 1657 to 1758 inclusive, with A Comparative View of the Diseases and Ages, and a Table of the Probabilities of Life, for the last 30 Years*, London, 1759, 4to.

[*Dict. Nat. Biog.*—M'Culloch, *Lit. Pol. Ec.*]

POSTLETHWAYT, MALACHY (1707-1767), wrote on the financial condition of the country from the standpoint of seeking its improvement. His largest book, based on the French work of J. SAVARY DES BRULONS, of which it is in a great part a translation, was *The Universal Dictionary of Trade and Commerce*, London, 1st ed. 1751, 2 large vols. fol. 4th ed. 1774, apparently little more than a reprint of the 3rd ed. of 1766. The book contains a good deal of information, often taken from the works of others, and, generally without acknowledgment, put together in an unsystematic manner (M'Culloch, *Lit. Pol. Ec.*). He also wrote: *The African Trade the Great Pillar and Support of the British Plantation Trade in America*, etc., 1745, 4to.—*The National and Private Advantage of the African Trade considered*, 1746, 4to.—*Considerations on the Revival of the Royal British Assiento . . . with an attempt to unite the African Trade to that of the South Sea Company*, etc., London, 1749.—*Great Britain's true System*, etc., 1757, "little more than a transcript from CANTILLON's book, published two years before" (Cossa, *Introd. to P. E.*, trans. by L. Dyer, Macmillans, 1893).

Postlethwayt "compares the commercial and colonial policy of England with that of Holland, and tries to show how the British system might be improved, so as to outdo our rivals."—Cunningham, *Growth of British Industry and Commerce in Modern Times* [see also Ashley, *Introduction to English Economic History and Theory*, and *Dict. Nat. Biog.*].

POSTLIMINIUM, the *jus postliminii* is an expression used in Roman law for the right of a person on his return from capture in an

enemies' country to be put in the same legal position as he held before his capture, his recovery of his rights being based on the fiction that he had never left his own country and so had never lost his rights by becoming a slave of the enemy.

E. A. W.

POTHIER, the abbé Remy (1727-1812).

Wrote: *Éclaircissements sur le prêt, l'usure et le trafic de l'argent* (Reims, 1809) in opposition to the strict views of CANON LAW (*q.v.*) on these subjects.

E. Ca.

POTHIER, ROBERT JOSEPH (1699-1772), a councillor at the *Présidial*, a court of justice, and professor of law at the university of Orleans. He is said to have been so conscientious in the discharge of his judicial duties that, having once forgotten to mention, in a report, a document decisive on the case, he indemnified the losing party out of his own pocket. A member of the *Chambre des Domaines*, he so often inveighed against the fiscal exactions of the revenue officers that they were wont to call him the "intractable" man.

A studious and highly gifted jurist, he worked twelve years at the correction and co-ordination of the text of the *Pandects—Pandectæ Justinianæ* 1748 and 1782; translated into French in 1817, 26 volumes, and in 1818-20, 5 vols. 4to. Some years earlier he published the *Coutume d'Orléans* (1760, 1776, and 1780). Thoroughly acquainted with French law, he wrote a long series of learned monographs on all its various branches: *Traité des Obligations—du Contrat de Vente—des Fiefs—des Constitutions de Rentes, etc.*, which has been of invaluable assistance to the authors of the present *Code Civil*. Writing with great simplicity and extreme clearness, he was accustomed to examine every question under the double aspect of the *for intérieur* and the *for extérieur*.—natural equity and positive law. His works have often been republished in a collected form, from 1773 to the present time (Pothier, *Œuvres annotées et mises en corrélation avec le Code Civil et la législation actuelle*, par Bugnet, 2nd ed. 1861-62, 11 vols.).

E. Ca.

POTTER, WILLIAM (17th century):

Published anonymously *The Key of Wealth; or a new way for improving of Trade, etc.* (London, 1650, fol.). This work, being in the nature of a lengthy and involved discourse, the author published a short abstract of the same under the title of *The Tradesman's Jewel; or a safe, easie, speedy, and effectual means for the incredible advancement of Trade and multiplication of Riches, etc., by making Bills become current instead of Money* (London, 1650, 4to). The author is here concerned to show how the advancement of trade depends upon the quick circulation of commodities which in their turn are proportionable to the revolution of money or that which passes for such. To facilitate a quicker mercantile exchange, Potter advocated the current use of bills drawn on fixed security of land, houses, or known capital, and the formation of a reliable company of tradesmen who should be responsible for these bills printed

in their name. This security was to be further "backed" by annually-paid insurers, who, in case of the highly improbable failure of all the company, would make the bills good. Under these conditions the credit of these bills would, the author thought, be every whit as assured as that of the Chamber of London or the Bank of Amsterdam. In the same connection Potter also published *Humble proposals to the Honble. the Council for Trade, . . . shewing what particulars . . . if enacted by Parliament, would conduce to advance trade, imploy the poore and prevent the cruelty of creditors . . . tending (likewise) speedily to promote the enterprise discovered in a late treatise entitled the Key of Wealth* (London, 1651, 4to).

A. L.

POULETT SCROPE. See SCROPE.

POULLAIN, HENRY (end of 16th and beginning of the 17th century), appears to have been connected with the mint. The French monetary system for the coinage of gold and silver had preserved the old mediæval ratio of 12 to 1, which no longer corresponded to the actual ratio resulting from the larger quantities of silver relatively to gold imported from America during the 16th century; other countries had adopted different and higher ratios, whence a great deal of trouble and disturbance in France, a flowing out of French gold and silver, and an extensive circulation of inferior foreign coins, which attracted the attention of SULLY (see his *Économies Royales*, section iv. "Questions Monétaires," pp. 110-114 in Guillaumin's *Petite Bibliothèque Économique*).

On this occasion Poullain printed, under the title of *Traictés des Monnoyes pour un conseiller d'Etat* (Paris, 1621, reprinted by Leverrier in 1709) the memorials, which he at different dates had submitted to various statesmen; the first one only (*De la Science et Cognition que doit avoir un conseiller d'Etat au fait des Monnoyes*) is inscribed to Sully. It is divided into twelve *Maxims*, and is directed principally against the mintage of excessive quantities of small copper coins, an expedient then followed in Spain, which evidently excited the fears of Poullain; enumerating the six possible means of *weakening* the currency, he emphatically declares this one to be more dangerous than the five others taken together (p. 27, ed. 1621).

As to the exports of specie resulting from the existence of different ratios in different countries, a circumstance on which Poullain insists, he only once alludes to the desirability of making an international arrangement, which certainly was beyond reach at the period when he wrote. His remedies are the prohibition of monetary exports, and regulations ordering that no foreign coins shall be allowed to enter the kingdom: by exception, the most usual ones may be accepted by French merchants residing near the frontier, but only by *weight* instead of by *tale*, thus recommending a curious revival of a practice said to have been prevalent during the middle ages, and with the further obligation to carry them to the nearest mint to be recoined.

## POUND.

Pound, Egyptian, p. 178; Sterling, p. 178; Tower, Troy, Avoirdupois, p. 178; Turkish, see Medjidie, p. 179.

**POUND, EGYPTIAN.** The currency of Egypt was re-organised in 1885, the standard of value then adopted being the gold pound of 100 piastres. This pound is of the weight of 8·500 grammes, and is composed of gold of the millesimal fineness of 875. Its value in English standard gold (1 oz., 916·6 fine = £3 : 17 : 10½) is 20s. 3·7d.

In addition to the pound the law provides for the issue of gold coins of the value of 50, 20, 10, and 5 piastres, proportionate in weight to the standard coin, and of the same fineness.

The English sovereign, the French 20-franc piece, and the Turkish pound, circulate in Egypt, and are received at the following rates :

Sovereign	97·50 piastres.
20-franc piece	77·15 "
Turkish pound	87·75 "

F. E. A.

**POUND STERLING.** This title, which now stands for the gold sovereign, was originally used to designate a pound weight of silver (5760 grains), of which 11 oz. 2 dwt. consisted of fine metal and 18 dwt. of alloy, which is equivalent to a millesimal fineness of 925. The word "sterling" implied silver coin of this fineness, to which reference is made by Ruding as having been the "old standard of England" in the reign of Edward I., and which was probably introduced into this country by the Anglo-Saxons.

The "pound sterling" was therefore a pound weight of silver of the recognised standard, and one of the earliest instances of the use of the expression occurs in the fourth year of Henry II.'s reign (1158). This pound was coined into 240 pence (see PENNY).

Sterling fineness was maintained unaltered until the reign of Henry VIII., when a debasement of the coinage was begun, and continued until the reign of Mary. On the accession of Elizabeth the old standard was re-established. With the exception of this brief period of fifteen years, the sterling fineness of the silver coins of England was maintained without alteration from the earliest Saxon times until the year 1816, when the standard silver currency was abolished.

In 1816 the standard silver currency was discontinued, and a gold standard of value adopted. The silver token coins then introduced are, however, of the same fineness as that of the old currency, the continuity of the sterling fineness of the silver coins being thus maintained to the present day. The title "pound sterling" has, however, since the above-mentioned date, been applied to the gold sovereign, which in its turn is subdivided into 240 pence. Both the words "pound" and "sterling" now used to describe the sovereign, are thus legacies from a former system of currency. The title "pound" has no reference to any pound weight of gold, and the term "sterling" originally implied coins of a millesimal fineness of 925, whereas the fineness of

the gold coin is 916·6. In the sense, however, that "sterling" represents coins of the standard fineness fixed by law, the term may be considered rightly applied to the gold coins of the realm.

The following table records the various finenesses adopted for the silver coinage during the period of debasement referred to (see ALLOY):—

Year.	Reign.	Fineness of the Pound.		Fineness expressed millesimally.
		Silver.	Alloy.	
		oz. dwt.	oz. dwt.	
From the introduction of "sterling" by the Anglo-Saxons to the year 1542.		11 2	0 18	925·0
1543	Henry VIII.	10 0	2 0	833·3
1545	"	6 0	6 0	500·0
1546	"	4 0	8 0	333·3
1547	Edward VI.	4 0	8 0	333·3
1550	"	6 0	6 0	500·0
1551	"	3 0	9 0	250·0
1553	"	11 1	0 19	921·25
1553-58	Mary	11 1	0 19	921·25
(1558 to 1816)	Elizabeth to George III.	11 2	0 18	925·0

The origin of the word sterling is generally traced to **EASTERLINGS**; the name popularly used in Norman times to designate traders with England who hailed from German and Scandinavian ports, and in dealing with whom this standard of value was employed.

F. E. A.

**POUND. TOWER, TROY, AVOIRDUPOIS.** The old mint pound, kept in the Tower, and known as the Tower pound, was equal to 5400 of our troy grains. It was the standard for gold and silver from Saxon times, and this weight of silver was the earliest form of the pound sterling. An Act of 51 Hen. III. (1266) declares that the English penny, "called a sterling, shall weigh thirty-two wheat corns in the midst of the ear; and twenty pence do make an ounce; and twelve ounces a pound." This gives us the origin of the divisions of our monetary system.

Troy weight was probably introduced from France early in the 14th century. By an Act of 18 Hen. VIII. (1527) the Tower pound was abolished, and the "pounde Troye, which exceedeth the pound Tower in weight iii. quarters of the oz." was declared the legal standard for gold and silver. Taking the Tower pound at 11½ troy ounces, the troy pound would weigh 5760 grains, as at present.

The **AVOIRDUPOIS** pound, of 16 ounces, and equal to 7000 troy grains, is at least as old as the beginning of the 14th century, and superseded the old commercial pound, or merchant's pound, which contained 14 Tower ounces, or 6750 grains troy. There was also formerly in use a commercial pound equal to 16 Tower ounces, or about 7200 grains troy.

Our present standard weights are believed to be almost exact equivalents of those, legalised in 31 Edward I. (1303), renewed in 12 Hen. VII. (1497), and again in the reign of Elizabeth (1588), and kept in the Exchequer. They were again adjusted by 5 Geo. IV. c. 74 (1824),

which declared the standard troy pound to equal  $\frac{5760}{252 \cdot 458}$  of the weight of a cubic inch of distilled water, temperature 62° Fahr., barometer being at 30 inches; and finally they were scientifically adjusted by the Standard Commission (1843-1854).

Troy and avoirdupois weights compare with metric weights as follows:

1 grain troy =	·06479895 grammes
1 lb. troy =	373·23937728 „
1 lb. avoirdupois =	453·5926521 „
1 gramme =	15·43234874 grains troy
1 kilogramme =	2·04621248 lb. avoirdupois.

POVERTY. Much of the confusion of thought incidental to economics arises from the fact that the terms employed have also a popular and loose sense. We speak of the poverty of an individual or of a nation, but we also speak of poverty of surroundings, of intellect, even things inanimate, as scenery, or a building, or a poem, are said to be poor. Underlying all these uses is the same idea, viz. a defect or shortcoming with reference to an end or to a standard, more or less arbitrarily set up. Applying this economically, we find that poverty implies the absence of some of the material conditions or "goods" of life, without which life is imperfect. Thus Aristotle, in a well-known passage in the *Ethics*, speaks of a certain *χρημία* or equipment, without which goodness and happiness are impossible. So that, whatever be taken to be the end of life, poverty implies an insufficiency of the material equipment needed to attain to it. This marks it off at once from destitution, which implies the want of the conditions necessary to a merely physical life, or to put the distinction shortly, destitution is the lack of the necessities of life, commonly so called, poverty an insufficient supply of its comforts (see POOR).

Although it is no doubt true that material well-being is not the only or the highest end in life, no one would seriously combat Aristotle's statement that a certain level of material comfort, the provision of a certain amount of necessities and conveniences, is essential to any high type of life whatsoever. Hence a growing conviction that poverty is an evil which the government of a country should combat. Such a feeling is of comparatively recent date, as witness the writings of the early church fathers on the subject, and the popularity in the middle ages of vows of poverty, with their embodiment in the orders of monks and friars.

But granting that the lessening of poverty, or in other words, the general diffusion of a

higher standard of material comfort, is a proper aim for government—nay, one of the reasons for corporate life, the question remains how it may best be attained. The history of nations is a long record of the failure of experiments with this object. Governments have attempted by arbitrary action to raise wages and to cheapen commodities; to redistribute and to equalise wealth. The secret of their failure has lain in the fact that, so far from calling out and strengthening the motives which lead men to seek independence and to improve their position, they have weakened and crushed them. Without going too far into detail, the results of the teachings of experience may be summed up under one or two heads: (1) the history of the poor law has shown conclusively the mistake of endeavouring to act immediately on the individual, and to better his position, as it were, in spite of himself; (2) in this country, at any rate, we have satisfied ourselves that in all exchange of commodities the fullest freedom should be permitted, subject only to the prevention and punishment of fraud. The extension and development of this principle, till it amounts to a general policy of *laissez-faire*, allowing of unlimited competition, and leaving it to each to prove his right to succeed in the struggle, is claimed by the extreme individualists as the only solution of the problem. But (3) the tendency of the time is for government to interfere more and more where services are exchanged; strengthening the position of the weaker party, and enabling him to compete on somewhat more equal terms. Under this head would come the various acts of parliament regulating the relations between employer and employed. (4) Hand in hand with these measures go all those which aim at improving the conditions under which the poor live, at increasing their opportunities to improve their position, and so nullifying in a measure inherited inequalities, and the restrictive power of poverty. Such, for example, would be the provision of education, and the opportunities of carrying it on, whether general, in the shape of free libraries, or technical, in schools and institutions for the purpose. Closely connected with these are the opportunities for thrift which are afforded by the post office savings banks and insurance policies. It is a question of degree how far this provision of the means of escape from poverty should be carried. In education, for instance, we have now, as the phrase runs, a ladder set up by which the passage from one stage in society to another is made easier, but we do not, as is the case elsewhere, provide, to any large extent, means of rational recreation (see PUBLIC ASSISTANCE). (5) The work of the state in England may be said to be limited to the provision of an exodus from poverty, of which

men may avail themselves according to their inclinations and powers. The extreme socialists would go much further in the direction of organisation and co-operation, until the means of production, being in the hands of the state, it can deal with poverty and gradually abolish it. But here, more than in most fields of practical economics, a wide experience of the effects of moderate action is needed to justify recourse to extreme measures.

The above is a rough sketch of the attitude of the state towards poverty and its cure; the principles which should guide the individual in his use of charity towards this end may be seen in the articles CHARITY and CHARITY ORGANISATION.

It is not to be expected that poverty will ever "cease out of the land"; there must always be different standards of living in the different classes of a community, and there will always be those who, from some cause or another, drop from the higher to the lower. The most that can be achieved is that the passage upwards should be facilitated, and that the blame, if blame it be, of poverty should rest on the individual rather than on his circumstances, and that the hopelessness of poverty should become less pressing. There are not wanting signs that this is already the case in England. Among them may be mentioned the steady progress of the working class in material well-being, the improvement in their housing, clothing, diet, and education; the increase in the number of moderate, as compared with large fortunes, shown by the income-tax returns, the great development of the practice of insurance all through the community. These are evidence of independence of character, of the readiness to make use of opportunities which, without that independence, would be offered in vain. L. R. P.

POWER OF ATTORNEY. See ATTORNEY, POWER OF.

POWNALL, THOMAS (1722-1805), governor of the colony of Massachusetts Bay, wrote *The Administration of the Colonies* (1 vol. 8vo, 2nd ed., London, 1765; 3rd ed. enlarged, 3 parts, London, 1766, 8vo; 4th ed., 2 parts, London, 1768-1774, 8vo; 5th ed., 2 vols. 1774, 8vo). In the eight chapters of the first vol., the author considers the necessity for forming a state office for administering the business of the colonies; a bill of rights and general act of commerce for the colonies; the manner of providing for the support of the king's government in the colonies, and the state of the courts of judicature there; their internal taxation; general principles of money both in coin and paper; the administration of their (American) Indian affairs; and lastly, a consideration of the commerce which arises from the colonies, and the revision proposed of the actual state of that of the British colonies.

Pownall also wrote *A Letter to Adam Smith, being an examination of several Points of Doctrine laid down in his Enquiry into the nature and cause of the Wealth of Nations* (London, 1776, 4to).

[Rae's *Life of Ad. Smith.*]

POYNINGS' ACT (Law) was a legislative measure which formed an epoch in the history of Ireland. In the time of Henry VII. English authority over Ireland had reached its lowest point; and it became necessary to make the subjection of the country, so far at least as the settlers of the PALE were concerned, something more than a mere name. The great Norman family of the Geraldines had acquired almost unlimited power in Ireland; and when they supported the cause of Perkin Warbeck and Lambert Simnel, Henry determined to retaliate on them and on Ireland. He accordingly sent Sir Edward Poyning as lord-deputy with a strong army, and full powers to effect a radical change. Poyning called a parliament at Drogheda (1494-95), and compelled it to pass the famous measure known as Poyning's Act. This act contained provisions to restrain the lawlessness of the Anglo-Irish within the pale and to confirm the royal sovereignty. All private hostilities without the deputy's licence were declared illegal, but to excite the Irish to war was made high treason. Murders were to be avenged by legal process, and not by pillaging and the exaction of fines. The citizens or freemen of towns were prohibited from receiving wages or becoming retainers of lords and gentlemen; and to check the power of the freemen, none who had not served apprenticeships were to be admitted as aldermen or freemen of corporations. The requisitions of coyne and livery were expressly forbidden, and the statutes of Kilkenny were renewed and confirmed. All the chief officers of state and the judges were to hold their patents during pleasure instead of for life as heretofore. But by far the most important provisions were those which enacted that all existing English laws should be in force in Ireland, and that no parliament should be held in Ireland without the sanction of king and council, who should also be able to disallow statutes passed by the Irish houses. These provisions practically annulled the legislative independence of the English colony in Ireland, and—as they remained in force for nearly three centuries—proved to be one powerful means for maintaining the subordination of the island.

[*Irish Statutes.*—Barnett Smith's *History of Parliament.*—Plowden's *History of Ireland from its Invasion under Henry II. to its union with Great Britain.*—Haverty's *History of Ireland, Ancient and Modern.*] G. E. S.

PRAEPOSITUS, or provost, rather a general than a particular name, given chiefly to the steward or bailiff of a manor, and to the reeve of a tithing or township, of a town or burgh.

If a municipal officer he had certain police duties, and represented the township in the higher local courts; if a manorial officer, he had to preside in the lord's court, collect his dues, and manage his estate. He was never a royal officer, being appointed by the lord of the manor or elected by the locality for which he acted. [Domesday. — Cunningham's *Industry and Commerce*.] E. G. P.

PRÆSCRIPTIO, was a clause sometimes inserted at the beginning of the formula of an action for the purpose either of enabling the plaintiff to qualify his claim (*præscriptio pro actore*) or of introducing an exception to an action on the part of the defendant (*præscriptio pro reo*). After the disappearance of the formulary procedure *præscriptio* became equivalent to *exceptio* and was particularly used to signify the exception or plea of the defendant that the action against him is barred on account of its not having been brought within the period fixed for its limitation. Under the law of Justinian *præscriptio longi temporis* was a means of acquiring a good title to land on account of possession for ten or twenty years, instead of being only a defence to the possessor against the action of the owner. Hence we find *præscriptio* divided by commentators on Roman law into *præscriptio acquisitiva*, by which a right is acquired, and *præscriptio extinctiva*, by which an action may be barred owing to lapse of time (see LIMITATION, STATUTES OF; PRESCRIPTIVE RIGHT.) E. A. W.

PRATT, J. TIDD (1797-1870) English juriconsult. Published:—*The Savings Banks in England, Wales, Scotland, and Ireland, arranged according to counties, and the increase or decrease of . . . depositors since November 1831, with an Appendix containing all the Returns relating to Savings Banks . . . since November 1830*. (London, 1834 and 1842.) McCulloch (*Lit. of Pol. Econ.*) refers to the work as "an interesting and perfectly authentic publication." A. L.

PRÆCARIÆ, or boon-work. Special work at plough-time, harvest, etc., done *ad precem* or *at bene* by the VILLEIN for the lord of the manor, and usually distinct from WEEKWORK. See SERVICES, FREDIAL AND MILITARY.

PRÆCARIUM, in Roman law, is a legal relation which arises when a person simply allows another, at his request, the use of a thing without entering into a contract of gratuitous loan (COMMODATUM) with him. The holder of a thing in this way has legal possession of it (see POSSESSIO), but the person who has allowed him to have it may determine the relation at his will; as, however, he does not hold under a contract he is not liable for ordinary negligence, but only for fraud or for such negligence as is equivalent to fraud. Precarium was sometimes only in form a gratuitous transaction, it being made use of to facilitate mortgages and for other business transactions. SAVIGNY suggested that precarium

originated in the practice of patrons allowing their clients to cultivate pieces of the *ager publicus* which they were in possession of. The position of a TENANT AT WILL of English law is in some respects analogous to that of the precarious tenant of Roman law. E. A. W.

PRECIOUS METALS (DISCOVERIES OF, 1492 to 1897). In the economist's vocabulary the term precious metals is used in a different sense from that in which it is employed in chemistry, and the standard for determining the metals that belong to this class is a different one. In economic parlance "precious" has reference to value, and means that which is rare and highly esteemed, and, by adding another quality, which is quite just, we may accept the definition given in the *Century Dictionary* and say that economists have agreed to call precious metals those metals that are "valuable enough to be used as a standard of value and abundant enough for coinage." Hence in general the term includes only gold and silver.

Platinum has a theoretical claim for admission in this category because it is rare, has great value, and has been used in coinage.<sup>1</sup> In the year 1828 the emperor of Russia issued an edict (24th April, Russian calendar) providing for the coinage of ducats having a value of three silver roubles and a weight of 10,353 grams, which established a ratio with gold of about 1 : 3. Later, coins of larger denominations were also issued, but platinum coinage in Russia was discontinued in 1845 on account of excessive fluctuations in the value of the metal.

The discovery of America marks no arbitrary division<sup>2</sup> in the history of the precious metals, but, on the contrary, Columbus's undertaking owed no small part of its stimulus to the depletion of the world's stock of gold and silver, and the success of his enterprise opened up the world's largest depository of those metals. The chief importance of the date 1492 rather concerns the statistics of the production of gold and silver than the question of the relation of those metals to each other (see GOLD, SILVER).

For twenty centuries before the discovery of America there was considerable stability<sup>3</sup> in the ratio of gold to silver; with few exceptions the value of gold did not exceed twelve times that of silver, and during the middle ages it was for the most part under that ratio. The range of variation in all that time was not half so great as within the past twenty years.

<sup>1</sup> See Lexis, article "Edelmetalle" in *Handwörterbuch der Staatswissenschaften*, vol. iii. p. 1, Jena, 1892.

<sup>2</sup> Lindsay, *Preisbewegung der Edelmetalle seit 1850*, etc., p. 82 ff., Jena, 1893.

<sup>3</sup> Soetbeer, *Edelmetall-Produktion und Werthverhältnisse zwischen Gold und Silber seit der Entdeckung Amerikas bis zur Gegenwart*, Ergänzungsheft No. 57 zu Petermann's *Mittheilungen*, Gotha, 1879, pp. 141 with three charts. Another of Dr. Soetbeer's contributions to this subject which he has treated more thoroughly than any one else as yet, is to be found in Hirth's *Annalen des deutschen Reiches*, Jahrg. 1875. The results of both these contributions are summed up in his *Materialien zur Erläuterung*

In discussing the ratio from 1492 up to the present time, we may conveniently distinguish three periods—first, from 1492 to 1687; second, from 1687 to 1873; third, from 1873 to 1897.

*First Period 1492-1686.*—This period agrees with the division made by Dr. Soetbeer, and the reason for stopping with the year 1686 is because the nature of the information, upon which our knowledge of the value of gold and silver is based, changes radically after this year. Previous to 1687 there is no record of regular, systematic, official market quotations whereby the values of gold and silver, and hence their ratio, may be followed in any one country for successive periods of time. An official circular was issued from Hamburg, the leading market of the time, commencing with 1660, which gave silver quotations, but gold was not quoted in this circular until 1687. In the first period, therefore, the sources of information consist of: (1) Mint rules and regulations which generally attempt to approximate the market ratio at the date at which they go into effect, though, of course, the real ratio may vary from the mint ratio at any subsequent time; (2) commercial account books, political essays, and reports of the time. The conclusions that may be drawn from these two sources are more satisfactory than might be at first supposed. Though they do not enable us to follow with accuracy the minute variations from year to year, we do get sufficient glimpses of isolated cases to be able to judge of the intervening movements.

The ratio of gold to silver at the time of the discovery of America was about 1:10.5, and had not varied much from that figure for twenty-five years previously, indeed, the variation had probably not exceeded one unit in the one hundred and fifty years immediately preceding this date, and for one hundred years after 1492 there was little change. Such as actually took place was gradual, it did not exceed one unit of divergence, and was of the nature of a rise in the value of gold. That so little change occurred is very remarkable, because great changes took place at the same time in the relative quantities of gold and silver produced; the average gold product in the twenty-four years 1521-1544 increased only 25 per cent over that for the twenty-eight year period 1493-1520 while the silver product almost doubled; comparing the sixteen years following (1545-60), when the Potosi mines gave their *und Beurtheilung der wirtschaftlichen Edelmetall-verhältnisse und der Währungsfrage*, Berlin, 1886. There are two English translations of the *Materialien*. One is entitled *Materials for the Illustration and Criticism of the Economic Relations of the Precious Metals, and of the Currency Question*, and was published as Appendix XVI. to the Gold and Silver Commission Report. See Blue Book, Appendix to Final Report of the Royal Commission, pp. 139-240, London, 1888. The other translation was made by Prof. Taussig of Harvard University, and published as Appendix II. to Mr. Edward Atkinson's Report to the United States Government on *Bimetallism in Europe*. See United States Consular Reports, No. 87, December 1887, pp. 438-663, Washington.

great yield, with the preceding period 1521-44, we find that the annual average silver product increased more than threefold, while that of gold increased very little, perhaps 15 per cent. Three hundred per cent increase in the silver product, 15 per cent in that of gold<sup>1</sup> and yet almost no perceptible change in the ratio! Soetbeer gives average ratio for years 1521-40 as 1:11.25, and for period 1541-60 as 1:11.30.

Whether the variation be great or small, the more difficult question to be determined is, which of the metals is responsible for the change, or whether both have varied? In the present case there seems to be some reason for supposing that gold rose slightly in value about 1550; though, if so, the rise was disregarded by the mint regulations of the time, and was perhaps limited to Germany, where so much money below standard circulated that it was necessary to tabulate the "ungarische Dukaten" and the *reichskstitutionsmässige* thalers which remained unchanged, and give their value in other coins. These tables, quoted by Soetbeer, form a valuable source of information from which we can get at the ratios of gold to silver. Other sources which are used as a basis for determining the ratio in Germany at different periods are: a "Rechenbuch"<sup>2</sup> from the year 1527 with a preface dated 1489 giving several quotations indicating a ratio of 1:11.2; Adam Reiss's Erfurt Records<sup>3</sup> of 1518, which show ratios of 1:10.31 with same ratio quoted in successive editions dated 1529, 1533, 1578, and 1581; report of Copernicus to King Sigismund in 1526 entitled *Moneta cudendae ratio*, and reprinted in collection made by Wolowski, Paris, 1864; mint laws of 1524, Reichs Münzordnung, 10th November 1524, establishing ratio of 1:11.38, those of 1551 establishing the same ratio, those of 1559 changing ratio to 1:11.44, and those of 1566 changing the ratio again to 1:11.55. In 1623 the Government Council made the ratio in Germany 1:11.64 which was unfavourable to gold, and Soetbeer claims that the mint ratio of Lower Saxony in 1610 (1:12.20) was nearer the market ratio. A report to the Reichstag in 1665 claims that the market ratio was about 1:14.26 and another report in 1669 gives the ratio as 1:15.11.

As for variations in England, Soetbeer relies upon the quotations based on mint rules and quoted by Ruding.<sup>4</sup> These show little varia-

tion from the ratio 1:11 for the period 1527 to 1601, but from 1605 on a rather rapid rise in the value of gold; thus 1605, ratio 1:12·10; 1610, ratio 1:13·3; 1619, ratio 1:13·3; 1663, ratio 1:14·5; during reign of William and Mary, 1:15·4; and 1717, ratio 1:15·2; Newton's report in 1717 recommended a ratio of 1:15·096.

Soetbeer quotes various figures taken from Holland and French records with similar results. In general, therefore, it may be said that during the 15th century and early part of the 16th, silver fell in value on account of increased production due to the Potosi mines. From about 1620 to the end of our first period (1687) there seems to have been a sudden and marked rise in value of gold combined with little change in condition of production of either metal, and

therefore probably due to the growing use and demand for gold in international trade.

*Second Period 1687-1873.*—The second period presents less difficulty in ascertaining the market ratio, because we have Hamburg official periodical quotations for both gold and silver, and regular quotations on the London market. It is only necessary to make accurate calculations for the same degree of fineness. Dr. Soetbeer has selected from this material, as most satisfactorily representing the best market, the Hamburg quotations from 1687 to 1833 and those of London brokers from 1833 to the present time. Mr. Seyd<sup>1</sup> has also prepared a series of figures giving notations of the Bank of England for years 1733 to 1819. In the following table the average price of silver and the ratio to one unit of gold are given for the periods indicated<sup>2</sup>:—

Average for Period.	Price of silver in shillings per standard ounce.	Ratio to one unit of Gold.	Average for Period.	Price of silver in shillings per standard ounce.	Ratio to one unit of Gold.
1687-1690	62½	14·98	1881	51½	18·16
1691-1700	63⅞	14·96	1882	51½	18·19
1701-1710	61¼	15·27	1883	50½	18·64
1711-1720	62½	15·15	1884	50½	18·57
1721-1730	62½	15·09	1885	48⅞	19·41
1731-1740	62⅞	15·07	1881-1885	50½	18·59
1741-1750	63½	14·93	1886	45½	20·78
1751-1760	64½	14·56	1887	44½	21·13
1761-1770	63½	14·81	1888	42½	21·99
1771-1780	64½	14·64	1889	41½	22·10
1781-1790	63½	14·76	1890	47½	19·76
1791-1800	61½	15·42	1886-1890	44⅞	21·15
1801-1810	60⅞	15·61	1891	45⅞	20·92
1811-1820	60⅞	15·51	1892	39½	23·72
1821-1830	59½	15·80	1893	35⅞	26·49
1831-1840	59½	15·75	1894	28½	32·56
1841-1850	59⅞	15·83	1895	29½	31·60
1851-1860	61½	15·36	1891-1895	35½	27·06
1861-1870	60½	15·48	1896	30½	30·59
1871-1875	59	15·98	1897	27⅞	34·20
1873	59½	15·92	1898	26½	35·03
1874	58⅞	16·17	1899	27⅞	34·36
1875	56½	16·59	1900	28⅞	33·33
1876	52½	17·88	1896-1900	28⅞	33·50
1877	54½	17·22	1901	27⅞	34·68
1878	52⅞	17·94	1902	24⅞	39·15
1879	51½	18·40	1903	24½	38·10
1880	52½	18·05	1904	26½	35·70
1876-1880	52½	17·90	1905	27½	33·87
			1901-1905	25½	36·30

<sup>1</sup> E. Seyd, *Der Hauptirrtum in der Goldwährung. Nebst kritischen Bemerkungen über Dr. Soetbeer's Schriften. Mit einer graphischen Tafel.* Rudolstadt und Leipzig, 1880.

<sup>2</sup> These quotations are taken from the reports of the director of the United States mint upon the production of the precious metals. This is at present the best

available source for statistics on this subject. The Mint Report quotations and ratios from 1687-1832 are taken from Dr. A. Soetbeer's *Edelmetall-Produktion und Werthverhältniss zwischen Gold und Silber*, Gotha, 1879; and have been compared by Dr. S. M. Lindsay with the original to ensure accuracy. From 1833-1873 the figures are from Pixley and Abell's tables, and from 1879-1905

Examining this table for the period 1687-1873, the first one hundred and thirteen years (1687-1800) show a variation not quite equal to one unit between the highest and lowest quotations; during the following seventy-two years (1801-73) the variation was still less, being scarcely more than a half-unit. This stability is no less remarkable than that during the 16th century, because equally great changes in the production of the precious metals took place. The average yearly production of gold from 1851-60 was nearly four times that for the years 1841-50. Therefore the causes that maintained stability in ratio must be sought for in the conditions affecting the demand for the metals rather than their supply.

*Third Period 1873-97.*—The period since 1873 has been an extraordinary one, and never has the question of the ratio of the precious metals called forth more discussion or greater anxiety on the part of economists, publicists, and legislators, nor indeed, has there ever been so great a need of knowing the real causes that determine that ratio. The London price of silver, as quoted for the year 1873, was 59½d. per ounce; in the month of March 1894 the price on the same market touched 27d., which means a fall of about 54 per cent in its gold price. Since then the average monthly quotations have fluctuated between 27 and 31½d., the highest figure reached in the period (February and June 1896), and remains in February 1897 at about 29½d. The ratio at the present date (February 1897) is about 1:31·76; for seventy-two years before 1873 the ratio did not vary one-half unit from the celebrated 1:15½ ratio of the Latin Union; in the twenty years since 1873 it has departed from that ratio by more than 16 units. Silver measured in gold has fallen. The following questions naturally arise: Is silver solely responsible for the great variation in the relation between the two metals, or has gold also changed? (See GOLD AS STANDARD; PRICES; SILVER.) How can such changes be measured, and is it possible to assign to each its share in the divergence of ratio? (INDEX NUMBERS.) What are the remedies proposed for maintaining a more stable ratio, and is such desirable and necessary for healthy industrial life? (BI-METALLISM; LATIN UNION; MONEY.) There has been a very great change in the respective uses of the precious metals, at least for coinage purposes, with the third period. Formerly silver was regarded very widely in Europe as well as in Asia as the metal best suited for coinage purposes, and in the early fifties there was considerable apprehension of a flood of gold and of a danger of losing silver in those countries where both

metals were coined at a fixed ratio. Now the opposite fear has led to the stoppage of silver coinage, except in insignificant quantities, in all countries except China and Salvador. The great extension of silver production since 1873 is one of the chief causes. India closed her mints in 1894, and Japan is now preparing for an exclusively gold standard coinage. So Asia has also joined in the struggle for gold. The outlook for a sufficient supply to meet this increased demand is brighter now than it was a few years ago (see GOLD; SILVER).<sup>1</sup> GOLD, INCREASE IN THE PRODUCTION OF; SILVER, PRODUCTION AND COINAGE OF, 1896-1905. For period 1897-1900 see Appendix.

[The literature which treats of this subject is so extensive that it is only possible to add to what we have already given in footnotes some general indications. The monetary bibliographies of Jevons; S. Dana Horton; and Soetbeer, *Litteratur-nachweis über Geld- und Münzwesen*, Berlin, 1892, may be profitably consulted. Then Von Praun, *Gründliche Nachricht von dem Münzwesen*, Leipzig, 1739, 3rd ed. 1784.—*Report from the Secretary of the United States Treasury on the Relative Value of Gold and Silver*, 4th May 1830.—21 Cong. 1 Session, *House of Representatives Document No. 117*, Washington, 1830.—Reprinted in Report of Interim Monetary Conference of 1878, Washington, 1879; see p. 558 ff.—*Reports of Monetary Conferences of 1878, 1881, and 1892.*—*Reports of Gold and Silver Commission*, London, 1887-88.]  
S. M'C. L.

**PRE-EMPTION, RIGHT OF.** The right of pre-emption is the right possessed by one party of purchasing property before or in preference to other parties. International law allows this right to a government with respect to goods belonging to the subject of another power, which are in course of transport across its territory. But modern international law restricts this right to cases in which the goods are on their way to an enemy, and are of such a nature that, without being contraband, they would be useful to him in the prosecution of hostilities.

English law once gave the purveyors of the crown a right of pre-emption in respect of all commodities wanted for the royal household. Such commodities might be taken whether the owners wished to sell or not, at a price fixed by appraisement. This right of pre-emption gave rise to such gross abuses that it was frequently the subject of complaint in parliament, and was finally abolished by the act for the abolition of military tenures passed at the restoration of Charles II. (12 Car. II. c. 24). Under the Lands Clauses Consolidation Act 1845 (8 & 9 Vict. c. 18), a person whose land has been

from daily cablegrams from London to the Bureau of the Mint. The averages for the five-year periods from 1876 to 1905 were made by averaging each column separately.

<sup>1</sup> See United States Special Consular Reports, *Money and Prices in Foreign Countries*, vol. xiii. pt. i. and ii., Washington, 1896-97, for an account of the mint rules, price, ratio, etc., in all foreign countries, based on replies received from consuls in August, September and October 1896.

taken by a joint-stock company under compulsory powers has a right of pre-emption if the company afterwards finds the land unnecessary for its undertaking, and so has to offer it for sale (see also PURVEYANCE). F. C. M.

PREFERENCE SHARES are shares in a company entitled to dividend in priority to the ordinary shares. The dividends on preference shares, like the dividends on ordinary shares, must be paid out of profits, and may not be paid out of capital; but it may be provided in the articles that the ordinary shareholders are not to receive any dividends until the arrears, if any, in the dividends of the preference shares have been cleared off. In such a case the preference shares are called "cumulative"; but if the dividend on the preference shares is payable out of the profits of each year only, they are called "non-cumulative."

As regards repayment of capital, the preference shares, in the winding up of the company, rank *pari passu* with the ordinary shares, unless the articles provide for any other arrangements. It also depends on the articles whether the voting rights of the preference shareholders differ from the rights of ordinary shareholders or not. It used to be thought that the power of a company to issue preference shares could be exercised to such extent only as the MEMORANDUM OF ASSOCIATION (*q.v.*) or the original articles authorised; but a recent decision of the Court of Appeal has established the rule that, notwithstanding the absence of authority in the memorandum, the articles of a company can at any time be altered so as to give the directors power to issue preference shares (*Andrews v. Gas Meter Company, L.R. (1897) 1 Ch. 361*). In a company having a large and honest ordinary capital an investment in preference shares offers good security, and the public estimation of such a security is clearly shown by the prices at which the preference shares of English railway companies find purchasers. On the other hand, preference shares are often issued in cases in which the ordinary capital is small, or, though nominally large, was not issued against cash but against property worth a great deal less than the nominal purchase price. In such cases the issue of preference shares by which investors are made to think that they will be entitled to a fixed interest is often resorted to with the intention of obtaining money from the public where other means of doing so would be useless, and the chances of obtaining dividends is as small as if the shares were ordinary shares. The voting rights of preference shareholders are generally less extensive than those of ordinary shareholders, hence the latter exercise a more extended control over the management of their company than the former. E. S.

PREMIUM. Lat. *praemium*—*prae*, and

*emo*, literally what one takes first or for one's self; hence, a reward.

In modern use the word has both of these meanings. In the first sense we have:—*premium*, in INSURANCE—the payment taken at once, and at intervals, to secure certain benefits either in the event of possible contingencies, or after the lapse of time. In life, fire, and marine insurance, the premiums are calculated upon plans which will be found fully described under those heads.

In the way of reward, *premium* is used to denote an amount offered by governments, or by individuals, to procure competitive designs for a building, or commemorative work of art, to stimulate invention, or to promote certain industries (see BOUNTIES). On the stock exchange, stocks and shares are said to be at a premium when their market price is higher than that at which they were originally issued (conversely, see DISCOUNT.) The market prices of new issues are generally quoted in this way, especially whilst they are being paid up by instalments, as it conveniently shows what part of the price is due to the appreciation of the stock.

In currency, when gold coins, for example, are of greater value than the notes in circulation of the same denomination, the gold is said to be at a premium. The expression, however, is apt to mislead, as it appears to indicate a scarcity of gold, when the only fact may be an overabundance of paper (see also AGIO). R. W. B.

PRENTICE, ARCHIBALD (1792-1857):

Wrote a *History of the Anti-Corn-Law League* (2 vols., London, 1853, 8vo).—A *Tour in the United States* (London (Manchester printed), 1848, 8vo). Two of his addresses on "Temperance" were published in the *Ipswich Series of Temperance Tracts* (2 vols., 1850 (?) 8vo). In these he considered "Wages as affected by Temperance," and showed how the only remedy the artisan could have against the encroachments of capital was the accumulation of a counter instalment of capital whereby, in case of a strike or lock-out, the labourer could fall back upon his savings until the capitalists offered him the just price of his labour. But the intemperate member of the community would save nothing, and therefore was in an unfit condition to contend, and must yield without a contest.

In another lecture on "Productive Labour and Temperance," Prentice insisted that the whole labour of manufacturing and selling intoxicating liquors was labour worse than thrown away. He showed by illustrations that the money taken from four years of abstinence from intoxicating drinks could be productively employed in constructing six thousand more miles of railway; that spent in five weeks of drink would suffice to construct a ship canal from Manchester to Hull, and so on. He strongly advocated the spending of the millions of money used in drink on something that would do good and not harm. Spent in clothing, or furniture, or education, it would have a permanent and lasting effect upon the generations which followed. A. L.

**PRE-ROMAN INDUSTRY IN BRITAIN.** The industrial condition of Britain before the historic period of the Roman occupation presents several points of interest to the student of industrial history, and the remains of the pre-Roman period are sufficient to enable us to gain some idea of the state of industrial development then prevailing. Traces of knowledge early developed are visible in the later history of agriculture, and it is even possible that additional light may be thrown on the origin of the manorial system from this source. At the time immediately before the Roman invasion, it is supposed (Rhys, *Celtic Britain*, pp. 213, 275) that three races inhabited Britain—the (1) aboriginal Iberians; (2) Celtic immigrants of an early invasion who amalgamated to some extent with the aborigines; and (3) Celts of a later migration in the east and south-east, known to Roman writers as Gauls. Of these races the first, the "Silures" of the Romans, lived in tribal communities (Dawkins, *Early Man in Britain*, ch. viii.) and possessed fixed habitations in the form not merely of caves, but of log-huts and wooden houses; they existed not only by the chase, but largely also on their own domestic animals. Specimens of their agricultural and other implements survive, and though made only of stone were sufficient for a variety of operations. The arts of spinning and weaving were also known to them (*Early Man*, p. 275), also those of flint-mining, pottery-making, and boat-building. Commercial intercourse existed, though only in the primitive form of barter (Solinus, c. 24), and that traffic of this kind was carried on over considerable distances seems evident from the fact that axes of jade are found in Britain, though jade is scarcely a product of Europe (*Early Man*, p. 281). In the forest clearings they grew flax and wheat (*ib.* p. 272) and kept pigs, sheep, goats, and oxen (the "Celtic shorthorn") (*ib.* p. 297). This early stage of civilisation survived in remote parts of Britain, almost unchanged, well into Roman times; but in most other parts metal implements, usually of bronze, were known, introduced possibly by the Celts of the earlier migration. The use of bronze rendered the agricultural operations before mentioned more easy, and improvement was made in house-building (*Early Man*, p. 352), harvesting, with bronze reaping hooks (*ib.* p. 360), and in spinning flax and wool (*ib.* p. 359), while the smith existed as a craftsman with a comparatively large array of tools (*ib.* p. 335). Mining was actively carried on in this epoch. The people had now left "the pastoral or migratory stage . . . had learned the simpler arts of society, and advanced towards the refinements of civilised life" (Elton, *Origins of English History*, p. 145), while "their pits and hut circles prove that they lived in regular villages" (*ib.*). The Celts or "Gauls" of the

later migration were quite familiar with iron implements and weapons, and appear to have been unduly depreciated, as conquered races usually were by classical writers (cp. Dion Cassius, *Xiphiline*, lxxvi. 12; Claudian, *E. Getic.*, 417; Solinus, c. 4). "The British Gauls," says Elton, "appear to have been excellent farmers, skilled as well in the production of cereals as in stock-raising and the management of the dairy. Their farms were laid out in large fields without enclosures or fences, and they learned to make a permanent separation of the pasture and arable" (*Origins*, pp. 115-116). They understood marling (*ib.*), a practice implying both agricultural skill and a well-settled mode of existence. The varieties of cattle now included, in addition to the Celtic shorthorn, the kylee or Argyll breed (*ib.* pp. 116, 117). There seems to be no trace of co-operative ploughing, as practised in the English village community in Saxon times (cp. Gomme, *Village Community*, pp. 281-284). Tin-mining was practised, and it continued into Roman times. Textile manufactures had progressed, and the use of dyes and patterns was common (Elton, *Origins*, pp. 110, 111). Neither the Roman nor Saxon invasions entirely obliterated these early races of Britain, and the influence of their industrial culture may be marked, especially in agriculture, in historic times.

### PRESCRIPTION.

Prescription, p. 186; Prescription (Fr.), p. 187; Prescription (Scots Law), p. 187.

**PRESCRIPTION.** A mode of acquiring title to incorporeal hereditaments by immemorial or long-continued use. The difference between prescription and CUSTOM is that by prescription a man can only acquire a title against a particular person, whilst by custom a title is acquired which avails against the whole world. The legal theory underlying prescription is that a man would not be left to the exclusive use of anything by the real owner for any great length of time in virtue of some previous grant; and accordingly, if a man has had such use continuously for a long time, without any one's permission and for himself alone, the law presumes that such a grant has been made by the only person that would have a right to stop him. Anciently a technical prescription was required for its establishment—proof of use and enjoyment from before the memory of man, but in the 18th century the period was fixed at twenty years, and has since as to certain rights been reduced to twelve years.

[See LIMITATION, STATUTES OF. Darby and Bosanquet, *S. of L.*, 1893—Gale, *On Easements*.—Nerri, *American and English Encyclopedia of*

*Law*, New York and London, 1892.—Markby, *Elements of Law*, Oxford, 1890.] A. E. S.

**PRESCRIPTION (Fr.).** In French law, the limit of time by which possession of property ceases to be contestable, claims are barred, and right of action lapses. The general rules of prescription are laid down in arts. 2219 to 2281 of the civil code. Certain claims are, however, not prescribable, as the capital of money in the public funds; but the interest on the sums is paid over to the state at the end of five years. Prescription may also be suspended by circumstances. The term of prescription for debts varies. Thus the claims of teachers for lessons, workmen for wages, hotel-keepers for board and lodging, are limited to six months; those of doctors for medicine and attendance, boarding-school masters, and servants hired by the year, to twelve months; of solicitors to two years from the date of the judgment or settlement of the cause, etc. The extreme time for prescription in any case is thirty years (**PRESCRIPTION; PRESCRIPTION, SCOTS LAW; PRESCRIPTIVE RIGHT**). T. L.

**PRESCRIPTION (Scots Law).** In Scotland, an action on a bill or note cannot be brought after six years, though the debt may still be proved otherwise, and in that case there is a "limitation." But after forty years there cannot be any action on the personal debt at all unless it has been kept alive by acknowledgments, payment of interest, etc., and the debt is then said to be "prescribed." The "positive prescription" is the method by which rights acquired become unchallengeable; e.g. continuous and peaceable possession of land or real rights in land on an *ex facie* good registered irredeemable title, without interruption, for twenty years; on redeemable titles, forty years; easements and rights of way, forty years. "Negative prescription" is the extinction of rights by lapse of time: e.g. the extinction of a personal debt by lapse of forty years, as above, which period may be lengthened through years of minority of parties not being counted; the right to object to a conveyance, on grounds not appearing on the deed itself, lapses in forty years; customary rights, such as vicarage tithes, lapse in forty years through a contrary usage of non-payment; the right to assert a claim to being heir lapses in twenty years after the last claim to heirship was admitted. There are also other cases in which the burden or mode of proof is generally changed; for example, an unwitnessed acknowledgment of debt in a debtor's own handwriting cannot be founded on more than twenty years after its date, but the debtor can be made to swear whether it was his writing and the signature his, and if he admit this, he must show that the debt has been discharged: tutors and curators (guardians) of a minor cannot be called to account more than ten years after their office has expired; sureties are, as a

general rule, subject to many exceptions, not bound for more than seven years; bills and notes, except bank notes and post-bills, cannot themselves be founded on after six years, but the debt may be proved by some other means, including the oath of the debtor himself; arrears of rent of agricultural land lapse after five years from the tenant leaving the land; and current accounts in general can only be proved after three years by a written acknowledgment of the debtor, or by referring the truth of the matter to his oath. Many of these cases are truly examples of limitation rather than prescription; but both limitation and prescription are generally treated of under the same heading, "Prescription." A. D.

**PRESCRIPTIVE RIGHT.** A right acquired by lapse of time. The principle of permitting rights to be so acquired appears to be necessary in order to prevent litigation. "Possession of a certain standing," says Bentham (*Principles of the Civil Law*, pt. ii. ch. i.), "ought to be superior to all other titles" on the ground that one of the chief aims of legislation regarding property should be security.

[Sir Henry Maine, in *Ancient Law*, London, 1886, traces the growth of prescription in Roman law from which it has descended to modern legal systems.—Bentham, in the *Civil Code* (*supra*), discusses its justification.—Herbert, in the *History of Prescription in England*, London, 1891, traces the development of the doctrine in English law. For the present law in England, see Darby and Bosanquet on the *Statute of Limitations*, London, 1893 (see **LIMITATION, STATUTES OF**).] J. E. C. M.

**PRESENT GOODS** are valued higher than future goods for reasons considered under the head of **DISTANCE IN TIME**. . . . The depreciation of future goods is a factor in the conditions which determine the rate of interest, in the equation between present goods loaned and future goods discounted. If the depreciation of future goods become less *ceteris paribus*, the rate of interest will fall. But the depreciation is not a measure of the rate in general; it is so only on a particular hypothesis carefully defined by Prof. Marshall (*Principles of Economics*, 3rd ed. pp. 195-199, 306-307, note v. *et passim*).—Contrast Launhardt, *Mathematische Begründung der Volkswirtschaftslehre*, § 2, pp. 6, 7 (see **DISTANCE IN TIME; FUTURE GOODS AND SERVICES; INTEREST, THEORY OF**).

[John Rae in his *New Principles*, and Prof. Böhm-Bawerk in his *Positive Theory of Capital*, are, with Prof. Marshall, the authors who have treated the subject most profoundly.] F. Y. E.

**PRESSURE, MONETARY.** Monetary pressure is a term used to denote a condition of the money market (see **MONEY MARKET**), in which a large proportion of the persons forming the market are simultaneously desirous of borrowing money, and are ready to give abnormally high rates for the use of it. This state of

things may arise (1) owing to some temporary circumstance, such as the accumulation and "locking up" of a considerable amount of cash in the form of deposits made on application to a large loan; or the withdrawal from the market of money that has been out at "call" pending the completion of some operation for which it has been previously accumulated. (2) It arises periodically as one of the results of over-speculation, and in this case may last for some time. This form of monetary pressure is merely one of the phenomena of the normal cyclic movements of commerce (see *CRISES, COMMERCIAL; CREDIT, INFLUENCE ON PRICES*). Temporary pressure may and does arise, from time to time, during periods of "cheap money"; and the pressure tends to recur more frequently and with increasing intensity as the period of cheap money draws to its close, after which, for a time, the pressure becomes practically continuous, and, usually, ends by becoming acute. The rapidity with which the integration of a series of temporary states of pressure will produce acute pressure depends on various circumstances, the most important being the question whether the "locking-up" of money is permanent and therefore preparatory to its withdrawal to a foreign country, or is merely a stage in the transfer of money from one set of persons to another within the country. In the latter case the period of pressure is only momentary. If there were a large conversion of circulating into fixed capital within the country during a short period, severe pressure might arise, especially if the lock-up of capital were accompanied by speculation. No such conversion of capital has occurred in the United Kingdom on a sufficiently large scale since the railway mania of 1847-48, and it does not seem probable that a similar phenomenon will be seen again. Serious pressure is, therefore, only to be expected after the withdrawal of a good deal of capital for investment abroad. *W. H.*

**PRESTATION (Fr.).** A tax paid in kind or by a service. It now only exists in France for the purpose of providing for the construction and maintenance of communal bye-roads, etc., and as a relic of the *corvée* or forced labour that existed before the revolution of 1789. The tax was sanctioned by a law of 1824, which declared that where the ordinary resources of the commune are insufficient for the maintenance of the communal bye-roads, the municipal council may provide means by additional centimes to the four direct taxes, or by labour, not exceeding two days (since increased to three) annually, to be required from all the valid male population between the ages of eighteen and sixty, and the use of their carts, carriages, and horses. The tax may, however, be redeemed by a money payment per diem for each man, horse, or vehicle—the rate for which is fixed annually by the county council for each commune. Time,

usually one month, is allowed for the inhabitant to declare that he intends to work out the tax, and in default of such notice the tax is payable in money. The municipal councils summon the *prestataires* as required, and the season chosen for work is always that when field labour is light. The charge is not unpopular, and 70 per cent of the inhabitants liable to the tax prefer to discharge it by their labour. The prestation is however only applied in the poorer rural communes where the receipts from the ordinary taxes are small and money payment would be more onerous. *T. L.*

**PRICE, BONAMY (1807-1888).** An economist, interesting for the independence of his views, and for the spirit with which he expounds them. The animating principle of his writings is, that for an economist practical instincts are more needed than speculative ability; it being understood that practical instincts do not mean the art of getting on, but the determination of conduct on a large scale in matters of commerce and taxation.

Of political economy, he says (*Practical Political Economy*, p. 2): "Its value lies in its being understood by the mass of men. . . . Its aim is to make common sense the supreme ruler of industry and trade." Common sense here includes desire for the public welfare. He attacks practical errors, or what he regards as such, with greater keenness than speculative errors. In his opinion, the banking world bestowed undue attention on the amount of gold in the country, and by comparison too little attention on the soundness of their loans. "Mercantile crises," he writes, "never have their origin in a deficiency of currency, of coin, and notes of legal tender" (*Principles of Currency*, p. 79). He expounds this thesis, in the work referred to, with great variety of illustration. He insists (*Practical Political Economy*, p. 239) on the real identity of interest between employers and their workmen, except within certain narrow limits; in his exposition of the causes which on either side assail this common interest, some will think him unduly tender to the employer; but his analysis is keen. His analysis of the free-trade question in the same volume (pp. 299-334) is acute. Speculative theory is not absent from his writings, but generally it arises through connection with some practical topic.

Bonamy Price's active life consisted of three parts. From about 1830 to 1850 he was a successful assistant master at Rugby; from 1850 to 1868 he was engaged in various ways, among these as a political writer in London; from 1868 to 1888 he was professor of political economy at Oxford. In the middle of these three periods he performed what seems to have been a signal service to the Scotch herring trade. From the year 1809 onwards the government had affixed, after due examination, a brand on the casks of herrings belonging to fishermen on the east coast of Scotland, before they were sent to the market, thus guaranteeing the soundness of their contents; and the guarantee had been found of special value in the foreign trade with Germany, etc. Objection

had been raised to this procedure; and Bonamy Price, Frederick St. John, and Captain Sullivan, R.N., were appointed by the treasury as a commission of inquiry into this and other matters. Mainly, as with great pride he used to relate in after years, through the influence of Bonamy Price, the commission gave their verdict for the brand which, he claimed, gave the small curer an equal chance with the large one; and, with slight modification, the practice has continued to the present day (see *Parliamentary Reports on Scotch Fisheries* for years 1856 and 1857).

At Oxford, Bonamy Price was held in very high esteem. Besides his professorial lectures there, he lectured in other places on political economy to large audiences, with great vivacity. His power of stimulating interest in the subject which he taught was great; and many public men and journalists were indebted to him, in their Oxford days, for their permanent appreciation of the value of political economy. His economic works, published during the last twenty years of his life, were *Principles of Currency* (1869); *Currency and Banking* (1876); *Practical Political Economy* (1878).

J. R. M.

PRICE, DR. RICHARD (1723-1791), dissenting minister and writer, is, in the field of economics, chiefly remembered as the author of the SINKING FUND (*q.v.*) scheme, afterwards adopted by Pitt. The gentleness and retirement of his private character and life afforded a curious contrast to the political controversies in which he became involved. His sympathy with the American rebels first led him into the field of politics, and it was a sermon of his on the French revolution which was the immediate cause of Burke's *Reflections*. In 1769 he gained the friendship of Lord Shelburne, whose views on many questions he shared.

Dr. Price appears first to have seriously applied himself to the theory of PROBABILITY (*q.v.*) in 1761. A complete edition of his *Works*, with a memoir by his nephew, W. MORGAN (*q.v.*) was published in 1816 in 10 vols.—Vol. 1 contains memoirs.—Vol. 2, *A review of the principal questions in morals*.—Vol. 3, *Dissertations on religious subjects*.—Vol. 4, *Correspondence with Dr. Priestley*.—Vols. 5 and 6, *Observations on reversionary payments; on schemes for providing annuities for widows, and for pensions in old age; on the method of calculating the value of insurances of lives; and on the National Debt*. Also, *essays on different subjects in the doctrine of life annuities and political arithmetic; a collection of new tables, and a postscript on the population of the United Kingdom*, 1st ed. 1769, 6th ed. 1803, edited by W. Morgan.—Vols. 7 and 8, *Political tracts, observations on the nature of civil liberty and the justice and policy of the war with America*, 1st ed. 1776, 8vo; *Additional observations*, 1777; *An appeal to the public on the subject of the National Debt*, 2nd ed. 1772; *The state of the public debt and finances in 1783*, Postscript, 1784; *An essay on population of England*, 1780; *Observations on the importance of the American Revolution*, 1784; and *Facts addressed to the landholders, etc.* The clearest statement of his views with regard to a

sinking fund is contained in *An Appeal*. After showing that the best kind of sinking fund is where the interests disengaged are themselves applied to the payment of the public debts, he affirms that "this kind of sinking fund, be its income at first ever so much exceeded by the new debts incurred annually, will soon become superior to them and cancel them." Thus "a state may, without difficulty, redeem all its debts by borrowing money for that purpose." Price had been anticipated in his theory by Sir N. GOULD (*q.v.*) in his *Essay on the Publick Debts of the Kingdom*, 1726, but the arguments were now put forward with incomparably greater force and persuasiveness. Price's views were controverted by Wilmfrey and the anonymous author of *Considerations on the Annual Million Bill, and on the real and imaginary properties of a Sinking Fund* (both tracts are amongst *Scarce and Valuable Tracts . . . on the National Debt and the Sinking Fund*, edited by J. R. McCulloch, London, 1857, 8vo), but little notice was taken of their arguments, and it was reserved to R. HAMILTON (*q.v.*) to prick the bubble of the theory.—Vols. 9 and 10, *Sermons*. See Preface to *Scarce . . . Tracts* as above for views as to sinking fund.

[Memoirs and works as above].

## PRICE AND PRICES.

Price, p. 189; Price (Rate of Wages in Cotton Trade), p. 189; Price of Gold and Silver, p. 189; Prices, History of, p. 190; Prices, History of (1850-90), p. 195; Prices and Money, p. 198; Prices, Real and Nominal, p. 199; Prices, Short Period and Long Period Supply, p. 200; Prices, Theory of, p. 200.

PRICE. The "price," is the money consideration which is given, under a contract, in exchange for the supply of commodities or services. Thus sale is defined to be the transfer of the property in a thing for a price. Therefore if goods are exchanged for goods, there is no price, and the contract is one of barter and not of sale.

By English law, when goods are supplied, or services rendered, which are intended to be paid for, but no price is fixed, a reasonable price must be paid. If the parties cannot agree on what is reasonable under the circumstances, the matter must be settled by litigation, and the tribunal (judge or jury as the case may be) then determines what is a reasonable price.

It is an inflexible rule of English law that the courts have no jurisdiction to inquire into the adequacy of a *bona fide* consideration. That is purely a question for the parties at the time when they enter into the contract. Gross inadequacy of price may be evidence of a fraud, but that is all.

M. D. C.

PRICE, as meaning rate of wages in cotton trade.

The word "price" is used in the cotton trade as meaning "rate of wages." The "lists" regulating wages are called "lists of prices."

[*Regulation of Wages in Cotton Industry*, British Association Report, London, 1887.] J. E. C. M.

PRICE OF GOLD AND SILVER. The price of each metal is always quoted on the London

market at per ounce standard, *i.e.* 916·6 and 925 respectively, but delivery is made in bars either fine or differing only by a few one-thousandth parts. See also MINT PRICE OF BULLION; PARTY OF VALUE. R. W. B.

**PRICES, HISTORY OF.** The materials for a satisfactory history of the course of prices in ancient times do not exist; even in mediæval times, though records are more abundant, they lack the regularity and continuity which characterise modern records; and, further, the available records do not supply the facts of price-variation for any wide range, even of important commodities, till comparatively recent times. In the scattered notices of prices with which we are obliged to be content over considerable periods of history there may be preserved for us, not in every case an average price of the article concerned, but the price under more or less exceptional circumstances, and it is therefore necessary to accept with due reserve the conclusions which may be drawn from the recorded facts. The most abundant records are those relating to corn prices.

At the end of the 5th century B.C. the medimnus of wheat at Athens cost 3 drachmas, while 5 drachmas was a common price in the time of Demosthenes. Other information on the price of wheat in Greece is obtained from a statement of Plutarch, according to which the medimnus cost one drachma in the time of Solon. In Plutarch's own time the same quantity cost four times as much. In Sicily, when Verres was prætor (ca. 70 B.C.), 12 to 18 sesterces the medimnus was the price of wheat, while the higher of these prices was esteemed low at Rome in the time of Nero. Barley, in Athens, was worth about two-thirds as much as wheat, but in Sicily and Northern Italy its price did not exceed the half of that of wheat. The price of an ox varied, during the period of greatest Greek prosperity (ca. 400 B.C.), from 50 to 100 drachmas, while one-fifth of these amounts will give the variation of the price of a sheep. The comparison of the rates paid for the hire of free labour with the prices quoted for corn, gives the result that in ancient Greece a bushel of wheat might be bought with the wages of two to four days' work, according as the work was more or less skilled. In Italy wages were lower as measured in corn, at any rate in the time of Cicero, who quotes a rate at which more than five days' labour would be needed to earn the price of a bushel of wheat.

The most important record of prices in ancient times is the edict of Diocletian *de pretiis rerum venalium* of the year 301 A.D., which fixes maximum prices for goods and for labour. The interpretation of these prices into their modern equivalents is not free from difficulty. It would, however, appear that the Roman pound of gold is to be reckoned as equivalent to 50,000 denarii (Lepaulle), or 10

denarii equivalent to 1 grain of gold or two pence sterling approximately. Using this equivalence, the following are a few sample prices from the edict. The price of wheat is not given, but it may, perhaps, be taken at about double that of millet.

*Prices from Diocletian's Edict A.D. 301.*

Rye, per bushel	27½d.	Pork, per lb.	8½d.
Millet, do.	23d.	Beef, do.	2½d.
Oats, do.	14d.	Butter, do.	5d.
Peas, do.	27½d.	Sea-fish, do.	5d. to 7d.
Salt, do.	5d.	Salt-fish, do.	2d.
Boots, per pair	22 to 44d.	Fowls, per pair	13d.
Tunics, according to quality of linen from 86s. to 180s.		Goose, each	22d.
		Oysters, per hundred	22d.

In regard to wages, the daily rates prescribed vary from 4d. for a shepherd and 5d. for other country labour, to 10d. for a smith, and considerably higher rates for painters, etc.; to all these payments must be added food. The tailor was to get 8d. to 10d. for making a cloak, the schoolmaster 10d. per month for each boy. It will be seen by comparison with the records of much later times that the level of prices indicated for the beginning of the 4th century was higher than that of succeeding centuries, and that prices did not rise above this level till quite modern times.

The material for price-history in the middle ages is enormously more abundant than for the times dealt with so far. The course of the prices of wheat and other grains and of the principal kinds of meat can be followed with tolerable continuity in several countries. The records are not, however, in general, sufficiently abundant and continuous to ensure that the averages deduced from them are truly representative prices, though it is probable that the larger fluctuations of price can be followed accurately enough. The severity of the fluctuations of prices with the seasons, which is abundantly proved by numerous records, causes solitary records of price to be assigned a weight far inferior to that which would be due to them had the seasonal fluctuations been known to be, as a rule, not extreme.

For the history of prices in England from the year 1259 onwards, the unequalled collection of records published by the late Professor Thorold ROGERS supplies invaluable material. Rogers found that the grouping of the prices which best brought out the principal movements was that shown in the table which follows. The first 140 years—to 1400—he considered together for many purposes, but the great plague in the middle of the 14th century produced a marked change, especially in the condition of the poorer classes. During the 140 years following 1400, all kinds of grain, peas excepted, were cheaper than in the second half of the 14th century. Meat became somewhat dearer, while wages maintain the advance of the preceding period and improve further. All this is in very striking contrast with the

fourth period, a period of greatly enhanced prices of commodities and but an inadequate rise of wages. The year 1540 is not the beginning of the rise, which for most commodities occurred between 1545 and 1550. The movement of prices at this time is of such importance that we venture to illustrate it in detail by directing attention to the table constructed by Rogers to show the ratios of increase in price of various important groups of articles.

*Ratio (to unity) of rise of price shown by comparison of 1541-82 with 1401-1540.*

I. Live stock and poultry . . .	2.62	VII. Building materials and nails . . .	1.71
II. Grain of all kinds . . .	2.40	VIII. Metals . . .	1.88
III. Farm produce and salt . . .	2.53	IX. Linen . . .	2.08
IV. Labour, mechanical and agricultural . . .	1.60	X. Clothing . . .	2.12
V. Fish . . .	1.62	XI. Paper and parchment . . .	1.50
VI. Fuel . . .	1.71	XII. Foreign produce, Western . . .	2.03
		XIII. Foreign produce, Indian . . .	1.88

The contrast between the rise of 50 per cent in wages after the Black Death, with but little rise in the prices of the prime necessities of life, and the 60 per cent rise here noted at a time when the chief commodities needed by the labouring classes increased by about 150 per cent in their cost, is most striking, and the effect on the welfare of the population of extreme importance. The primary cause of the great increase of most prices must be sought in the debasement of the currency by Henry VIII., for the effects of the new supplies of precious metals afforded by America were not

felt in England till after 1560. Prices had been rising before the debasement, slowly, but afterwards they rose at a startling rate, wages, as usual, rising most slowly.

Proceeding to examine the later periods, the rise of prices is seen to continue till the middle of the 17th century, after which it moderates greatly. In the sixty years following 1582, the price of various kinds of grain rose, on an average, 122 per cent on the prices of 1541-1582. Meat, poultry, and provisions rose 81 per cent; the cost of artificial warmth and light increased by 42 per cent; of the principal metals by 34 per cent; building materials 55 per cent; linen fabrics 31 per cent; woollen cloth 30 per cent; while the average rise of thirteen different classes of wages was about 33 per cent. During the following sixty years the prices of commodities advanced more slowly, while wages increased more rapidly. The further increase in grain prices was about 20 per cent only (on the prices of 1583-1642), in provisions about 40 per cent, about the same in artificial warmth and light, in metals about 18 per cent, in building materials 27½ per cent, in linen fabrics 9 per cent, in woollen 12½ per cent, but in wages 55 per cent. Even then, over the whole period of 120 years, the prices of food advanced fully half as fast again as wages, though most other articles advanced more slowly. The volumes which will contain Rogers' records for the 18th century are not yet published, so that it is not possible to carry on the record on the same basis after 1702, the

*English Average Prices from Roger's "History of Agriculture and Prices."*

Note.—The figures given for "Wages of Labourer" before 1400, are those of the thatcher, probably somewhat higher, therefore, than those of the ordinary agricultural labourer, whose wages are given for later dates.

end of the period treated in his fifth and sixth volumes. The table above brings together a selection from the averages he has prepared.

It must be remembered, in connection with the foregoing table, that, especially in the

earlier periods, the most representative records of wages are quoted by the piece. The time-rates selected are believed to represent fairly, so far as so limited a selection can do so, the general direction and amount of the leading

variations in the remuneration of ordinary labour, and of the labour of a skilled artisan.

To carry on the record somewhat further, we may turn to the work of Arthur Young, which is quoted in Tooke and Newmarch's *History of Prices*, vol. vi. As the figures for the earlier periods which Young gives do not coincide with Rogers' averages, we extract the following table for comparison:—

*Agricultural Labour in England. Average Wages per Day.*

Period.	Wages per Day.	Proportions of 20.	Period.	Wages per Day.	Proportions of 20.
1200-99	d.	3½	1701-66	d.	10
1300-99	4	4½	1767-89	12	12½
1400-99	5½	5½	1790-1803	15	16½
1500-99	6½	5½	1804-10	20	20
1600-99	10½	8	1811	25½	..
1700-99	15	12½	1767-1800	17	14

From the records of prices and wages before him, Young prepared a table of the comparative variations in price of a number of articles, from which the following is an abstract:—

*Prices and Wages in England, 1200-1810. Comparative Statement framed by Arthur Young in 1812.*

Period.	Food.			Wages.	
	Wheat.	Barley and Oats.	Beef Mutton, Veal, Pork, Bacon, Butter, and Cheese.	Agricultural Labour.	Carpenters and Masons.
1200-99	5½	4½	..	3½	4½
1300-99	6½	5	..	4½	5½
1400-99	8	23	..	5½	5½
1500-99	6	4½	..	5½	4½
1600-99	9½	8½	..	8	7
1700-99	9½	11½	10½	12½	11½
1701-66	7½	7½	7½	10	..
1767-89	11	11	11½	12½	..
1790-1803	13	16½	16½	16½	..
1804-1810	20	20	20	20	20
1767-1800	12	11½	13½	14	..

The way in which this table represents the facts will be clear by comparison with the preceding one, and the relation between food-prices and wages at different periods of our country's history is clearly shown by the method of comparison adopted.

For dates subsequent to 1720 the article on **WAGES AND PRICES OF COMMODITIES** (*g.v.*) supplies sufficient data to enable the direction of the movements to be traced as effectively as the tables in the present article permit for the earlier periods. The comparison of the figures there given with the tables quoted from Rogers

and the figures of Arthur Young will afford a conspectus of the leading price-movements in this country for seven centuries.

One important consideration must be further noticed, and that is that the money in terms of which prices are quoted underwent many changes during the centuries covered by the records. The relation between the most important of the prices in our tables and silver, as summarised by Tooke and Newmarch, may serve to sufficiently indicate the course which prices expressed in silver would take. The summary is based on the records of numerous authorities, and is given as applying to France as well as to England. It is as follows:—

(1) "That prior to about the year 1350, the average annual price of wheat per quarter was about *four ounces* of silver; (2) that from 1350 to about 1520 the price was considerably lower; and during the larger part of the interval was not more than *two ounces* of silver; (3) that from 1520 to 1560 the irregularities of the coinage in England, and to a great extent in France, render it exceedingly difficult to trace the course with accuracy; (4) that all the evidence coincides in showing that the first great rise of prices, both in England and France, was about the year 1570; (5) that from 1570 to 1640 the average annual price during a large part of the interval was equal to from *six to seven ounces* of silver, or equal to a rise of 200 per cent as compared with the prices prior to 1520; (6) that after the culminating point of 1640, prices somewhat declined during the sixty years to 1700; and declined somewhat more between 1700 and 1750; but the decline during these later fifty years was certainly occasioned, not by a rise in the value of silver, but by a fall, in consequence of abundance in the price of corn; (7) that subsequent to 1750 prices of wheat considerably advanced, in consequence of unfavourable seasons, and the interruption of war."

As the purpose of the present article is not to attempt to be exhaustive, which is forbidden by limits of space, but to give a brief sketch of the general course of leading prices, it is not necessary to add the table of the silver contents of our coinage at different periods, since the above extracts sufficiently describes the main movements of the price of wheat, thus giving, with the assistance of the tables of prices already quoted, the general features of the relation between silver and other principal commodities in the important periods of English price history.

For the prices of the last century, the statisticians who have constructed index numbers of general prices, have provided tables of great fulness, and also summaries of the movements of important groups of prices. The tables from which Jevons constructed his index numbers provide such records from 1782; and Mr. Sauerbeck supplies other tables for prices from 1818 onwards. The index numbers them-

selves provide the most useful summary of price movements for practical purposes. Briefly indicated they show that, from soon after the American war of independence till about 1810, there was a continuous and rapid rise of prices, amounting to over 80 per cent of the prices of 1786-89. From that point a fall, at first fluctuating, but, after the resumption of specie payments, rapid, set in. The general trend of prices since that time has been, first downward to about 1848-50, then upwards till 1873, since which time prices have again tended downwards with great persistence. These larger movements have been interrupted by the fluctuations connected with the commercial crises occurring at about decennial intervals during the century. The point reached in the downward movement of the first half of the century was some 25 per cent lower than that from which we began to trace the movement, just before the French revolution. The subsequent rise amounted to nearly 50 per cent from the low level then reached, and since 1873 a fall of nearly 45 per cent on the prices then ruling has been recorded, leaving present prices considerably below the level of 1850.

For the deviations in the movements of particular prices from this general course, reference must be made to the tables employed in constructing one or other of the leading index numbers. At the end of this article will be found a summary table of the principal movements in the best known index numbers.

For a general view of French prices, we shall refer to the admirable work of the Vicomte d'Avenel, who has collected a greater mass of information on this subject than any other writer. From his work the following table, arranged as nearly as possible so as to permit of convenient comparison with the English records given above, is derived.

*Prices in France.*

Period.	Wheat.	Agricultural Labour, Day Wages.	Carpenter, Day Wages.	Equivalent of Day's Wages of Agricultural Labourer.
	Francs per hectolitre.	Francs.	Francs.	In Kilo-grammes of Beef.
1201-1250	3·96	0·65	·02	1·78
1251-1350	6·89	0·67	0·92	2·19
1351-1375	9·00	0·90	1·17	3·33
1376-1525	4·97	0·64	0·97	3·04
1526-1575	9·50	0·72	1·07	2·60
1576-1650	17·75	0·76	1·17	1·83
1651-1700	14·75	0·80	1·10	1·83
1701-1750	12·90	0·69	0·98	1·70
1751-1790	13·91	0·76	1·02	1·44

The changes in the French currency obscure the real meaning of the price-movements, especially in certain critical periods. The author quoted supplies tables designed to enable

a fair comparison to be made of the larger movements with those elsewhere. It is as follows:—

*PRICES IN FRANCE.*

*Table of the Comparative Purchasing Power of Equal Weights of the Precious Metals at Different Periods.*

Period.		Period.	
1200-25	about 4½	1551-75	about 3

Hanauer's work on Alsace affords us an interesting record for further comparison from the 14th to the 17th centuries. The following is derived from these records:—

*Prices in Alsace.*

Period.	Wheat.	Pork.	Eggs.	Carpenter Wages by the Day.
	Francs per hectolitre.	Francs per kilo.	Francs per 100.	Francs.
1351-1400	5·17	0·81	·	1·68
1401-50	4·14	0·26	1·07	1·55
1451-1525	3·20	0·21	1·01	1·23
1526-75	6·58	0·23	1·57	1·22
1576-1625	10·78	0·41	2·42	1·30

Rye is generally quoted at about three-fourths the price of wheat.

For German prices in the middle ages we refer to Lamprecht. The values of corn, labour, etc., are expressed in grammes of silver (1 oz. troy = 31·17 grammes nearly).

In the 9th century, ordinary labour received, as daily wages, the value of 0·83 grammes of silver, while the day's food is estimated to cost 0·75 grammes. In the 13th century the malter (a measure varying in different localities) of wheat was worth 75·9 grammes of silver; in the 14th, it rises from 43 to 68 grammes, sinking to 30·3 grammes in the first half of the 15th century. We have also the following comparison between the price of a malter of rye and the daily wages of common labour:—

*Prices in Germany.*

Period.	Rye.	Wages.
	Grammes of silver.	Grammes of silver.
1250-1300	·	2·43
1301-50	50·37	2·60
1351-1400	61·06	·
1401-50	37·26	1·89
1451-75	26·14	} 1·73
1476-1500	17·74	

The rise of prices in the 16th century in Saxony is shown by the following statement

by Falke of the price of a Dresden bushel of different kinds of corn, in silver marks:—

*Prices in Saxony.*

Period.	Wheat.	Barley.	Oats.	Rye.
1455-85	3·07	2·82	1·27	2·33
1520-87	6·15	4·07	2·53	5·36
1558-99	12·25	5·72	3·57	9·72

A pound of beef rose from 10 silver-pfening at the beginning of the 16th century to 17½ in the middle, and 21 at the end. A journeyman carpenter or mason's weekly wages averaged 4·43 marks in the 15th century, but, in the face of higher prices of food, fell to 4 marks in the first half, and were only 4·20 marks in the second half of the 16th century.

To continue the record, we turn to Unger's figures for the price of wheat in Hanover. The measure employed is the himten (about ½ bushel), and the price is given in Mariengroschen (of which 36 go to the thaler). The average price for 1648-98 is 17·85 groschen, and for 1698-1748, 26·57 groschen.

Turning from this fragmentary record of German prices, we abbreviate from a record of the price of wheat in Udine. These Italian figures refer to the value in francs of a hectolitre of wheat.

*Prices in Udine (Italy).*

Period.		Period.	
1650-99	9·15	1800-19	24·51
1700-49	9·73	1820-49	15·03
1750-99	14·65	1850-99	19·72

In modern times the importance of the price of wheat, whether as an index of the course of general prices or as a measure of the purchas-

ing power of wages, is far less than in the middle ages, or even than it was a couple of centuries since. To trace the course of prices in general, we need either to follow the changes in price of each of several important commodities, or, what is more convenient for the purpose of tracing the broader outlines of price-movements, to make use of an index number showing the proportionate average variation of prices from some fixed date as reference point.

The index number prepared by Jevons, combining the prices of forty commodities, will show price-variations from 1782 to 1865. Sauerbeck's arithmetic average for forty-five commodities (thirty-one before 1840) beginning in 1818, continues to the present day. After 1840 some other numbers enable useful comparisons to be made, both between index numbers prepared on different bases, and between the course of prices in different countries. The following tables give, first, Jevons's and Sauerbeck's numbers to 1839; and, secondly, various index numbers for later dates. The numbers are grouped into five-year periods, so as to show the general movement without entering into tedious detail. It is important to notice that, as Jevons used geometric means, his figures are not to be expected to compare precisely with Sauerbeck's.

*Index numbers of gold prices before 1840.*

Period.	Jevons's Index Number for 40 articles.	Period.	Jevons's, 40 articles.	Sauerbeck's, 31 articles.
1782-84	97	1810-14	125	..

Reference might be made to other works dealing with one part or other of price-history, but a selection of those which are most authoritative and contain the widest range of information has been made. For modern price-movements the publications of learned societies supply information. The articles of Mr. Sauerbeck in the *Journal of the Statistical Society*, 1893, and following years, may be particularly mentioned. The article "Preisgeschichte," in Conrad's *Handwörterbuch*, by Professor Lexis, should also be consulted. It has supplied much valuable information.] A. W. F.

PRICES, HISTORY OF (1850-1896). In discussing the history of prices the economist and the statistician refer almost exclusively to wholesale prices. Statistics of retail prices are usually accessible only for very limited geographical areas and for very short periods of time. There is a stronger reason, however, for the reliance on wholesale prices. Retail prices reflect too often the influences of custom and of the whims of particular localities, so that comparisons between articles having the same name are often fallacious and the results are not indicative of general economic changes.

In the period from 1850 to the present time transportation by land and by water has been so well developed that wholesale prices in the leading markets of Europe and America, for the chief staple commodities at least, may be considered as having followed the same general fluctuations. It matters not therefore whether we measure London prices or New York and Hamburg prices, the results are of about equal importance in indicating economic changes in all these markets.

The first series of prices to be considered are those prepared by the finance committee of the United States Senate.<sup>1</sup> They cover 85 articles for the years 1840-60, and 223 articles for the period 1860-91. These were distributed among the chief groups of commodities as follows:—

Group.	Number of articles. 1840-1860.	Number of articles. 1860-1891.
Food . . . . .	30	53
Cloths and clothing . . . . .	9	28
Fuel and lighting . . . . .	1	10
Metals and implements . . . . .	12	54
Lumber and building materials . . . . .	15	35
Drugs and chemicals . . . . .	15	18
House-furnishing goods . . . . .	2	15
Miscellaneous . . . . .	1	10
Total . . . . .	85	223

<sup>1</sup> *Report on Wholesale Prices, Wages, and Transportation*, Washington, 1893, 4 vols.

The price quotations for these articles are in most cases actual prices for a specified date taken from the records of leading merchants and dealers in the several commodities, and for the leading markets of the United States for each particular commodity. The prices are usually those for a date in the month of January for each year unless some other month's quotations are more normal for the article in question. These actual prices were converted into relative prices, taking the single year 1860 as a base, and making the price of each commodity for that year equal to 100, and calculating those of previous and subsequent years as percentages of those for 1860—

Period.	All articles simply averaged.		Averaged according to importance in consumption.	
1840-44	108.8	Gold prices during war period.	91.0	Gold prices during war period.
1845-49	103.2		90.1	
1850-54	106.6		99.1	
1855-59	108.2		110.3	
1860-64	131.5	108.1	120.5	99.5
1865-69	178.8	118.7	182.4	120.5
1870-74	137.5	121.8	134.4	118.9
1875-79	110.9	103.8	112.9	105.7
1880-84	105.3		106.3	
1885-89	93.2		95.2	
1890-91	92.3		94.1	

In the second column of the above table the weighted average is given (see INDEX NUMBERS). This is calculated on the basis of the relative importance of the several commodities in the average of a large number of family budgets collected from all parts of the United States.

More widely known, but second in importance as to completeness and scientific value, are the price statistics published by the *Economist* on which are based the celebrated *Economist* index number. The prices given are based on one quotation for 1st January of each year, and in calculating the relative prices or index numbers the average of four quarterly quotations for the six years 1845-50 was taken as equal to 100 for each commodity. The tables of the *Economist* cover only 22 staple commodities. Averaged for quinquennial periods they are as follows:—

Period.	Average Index. 1845-50 = 100.
1851-54	106.5
1855-59	121.4
1860-64	141.4
1865-69	141.
1870-74	126.8
1875-79	117.6
1880-84	108.2
1885-89	96.2
1890-94	98.4
1895-97 <sup>1</sup>	89.

<sup>1</sup> (Average for three years).

Mr. R. H. Inglis Palgrave, in a memorandum submitted to the royal commission on the depression of trade and industry, estimated the relative importance of the several commodities in the *Economist's* tables by weighting them according to the annual consumption of each article calculated from the statistics of production combined with the excess of imports or exports. The results are as follows:—

*The average of the five years 1865-69 equals 100.*

Period.	Average relative prices without regard to relative importance.	Average relative prices according to grouping of relative importance.
1870-74	96.	99.
1875-79	89.	94.6
1880-84	81.2	87.4
1885	70.	76.

The weighted figure here as in case of the weighted figure in the table given above for American prices follows the same general direction in noting fluctuations as does the corresponding figure in the unweighted column, but the weighted average stands generally several points higher than the unweighted one.

Another valuable collection of price data, also based on English market quotations, are those prepared by Mr. Sauerbeck and published yearly in the *Journal of the Royal Statistical Society*. In computing relative prices as shown in his index number, Mr. Sauerbeck has taken the average for the ten-year period 1867-77 for his base as equal to 100. He has not weighted his articles, but his results for forty-five commodities and for six sub-groups are as follows:—

Period.	Vegetable food.	Animal food.	Sugar, coffee, and tea.	Minerals.	Textiles.	Staple materials.	Grand total.
1846-49	101.5	80.7	82.7	85.2	71.5	81.	84.
1850-54	89.4	74.6	88.6	90.4	81.2	90.6	85.4
1855-59	105.2	86.4	100.8	104.2	87.4	109.2	98.4
1860-64	98.	88.4	101.2	98.6	123.2	105.	101.2
1865-69	99.8	93.2	95.8	88.6	117.8	99.8	108.6
1870-74	98.8	102.2	102.	112.2	103.6	102.8	103.6
1875-79	92.4	102.	95.6	84.4	82.	90.8	91.
1880-84	82.	101.2	77.6	75.8	73.8	85.	83.
1885-89	65.8	84.4	60.	71.	65.4	69.4	70.2
1890-94	68.8	82.4	70.	71.8	58.8	67.4	68.6
1895-96	53.6	75.2	60.5	62.5	58.	64.	61.5

Last but not least we must consider the Hamburg prices prepared by the Hamburg bureau of commercial statistics. They cover the prices of over 300 articles from which Dr. Adolph Soetbeer selected nearly 100, and making some additions from other data, constructed his famous index which is made the basis of so much discussion of price movements. The figures cannot be brought down farther

than the year 1888 on the same basis owing to changes of method in collecting these statistics after Hamburg entered the German customs union. Dr. Heinz, the director of the bureau, has attempted to construct a figure for subsequent years that would give an estimated basis of comparison, and his figures thus constructed down to the year 1891 are published in the U.S. Senate report. He has also constructed an independent figure on a different basis from that used by Dr. Soetbeer, and one

which can be continued down to date. This is also given in an appendix to the U.S. Senate report, and is continued since 1891 in the annual publication of the Hamburg bureau.

Dr. Soetbeer's index for 114 articles and for his 8 sub-groups are given as follows; for five-year periods, which, however, do not correspond exactly with the same grouping of years which we have given in our other tables, but will serve as approximate comparisons for the periods in question:—

*Average for 1847-50 = 100.*

Period.	20 Products of agriculture.	22 Animal and fish products.	7 Southern products.	19 Tropical products.	14 Minerals and metals.	7 Textile materials.	11 Miscellaneous articles.	14 British manufactured articles.	114 Articles. Grand total.
1851-55	129.99	114.79	110.43	110.97	107.03	105.20	106.65	98.47	112.22
1856-60	131.84	132.31	134.72	122.61	113.59	107.12	108.21	102.41	120.91
1861-65	124.46	128.24	114.13	118.64	102.11	131.83	144.33	127.56	123.59
1866-70	137.74	136.35	121.54	118.32	95.47	129.17	105.90	130.55	123.57
1871-75	144.90	154.57	131.50	130.72	116.90	117.17	114.98	126.44	133.29
1876-80	138.12	146.76	138.91	126.38	94.35	102.33	96.79	111.70	123.07
1881-85	130.77	150.65	134.41	119.91	81.55	96.65	91.11	103.23	117.68
1886-90	101.07	130.64	126.10	117.32	76.13	84.86	81.69	95.88	104.46
1891	119.88	131.66	139.99	113.56	84.72	80.40	85.06	95.11	109.19

A more minute discussion of the above data for a study of the movement of prices in the period under consideration, and of the theoretical questions involved in the arrangement of these figures according to the various plans, is not possible within the limits of this article. Prof. R. P. Falkner, the statistician for the U.S. Senate committee, has in his analysis of the tables in that report gone to great trouble to ascertain and explain the way in which these several groups of statistics were collected, and the methods used in the construction of the various tables. Dr. S. M. Lindsay has in another place discussed at greater length the theoretical methods of grouping price statistics.<sup>1</sup>

A few observations may be made as to the general movement of prices. In 1850 prices were high compared with the periods immediately preceding. General prices rose steadily until the panic of 1857. This was supposed to be partly due to stimulation of industry through the gold discoveries and partly due to changes in the monetary standard, due also to the increased supply of gold. From 1857 to 1862 American prices fell steadily. This was during the period following the panic, and before the effects of the civil war on industry began to make themselves felt. European prices recovered sooner from the industrial crisis in 1857, and prices continued to rise. The war in America seems to have exerted almost as

great an effect on European gold prices as it did on American gold prices. The period from the close of the American war to 1873 was a period of high prices in all markets, and then there came another industrial crisis and a long period of falling prices which has been interrupted but slightly, and for very short periods, down to the present date. This continuous fall in prices has been a subject of much discussion in connection with propositions for changing the monetary standard in various countries (see BIMETALLISM; GOLD AS STANDARD; SILVER AS STANDARD; INDEX NUMBERS). This fall is the characteristic feature of the period under discussion. It seems to be contrary to all past experience. In spite of better statistical facilities for measuring it, and a more uniform basis of comparison between various markets, owing to development in transportation facilities, than probably existed in any earlier period, there is far less agreement as to the causes of this persistent downward movement in general prices. The demonetisation of silver by Germany, and later the attempt of all the leading commercial nations to establish the gold standard on a firm basis, and a corresponding distrust of silver for monetary purposes, is one reason alleged for the movement in prices since 1873. Reduced cost of production, improved processes and increase of capital, and enormous increase in the use of machinery in all lines of industry, are also causes alleged to account for these changes. Greatly reduced cost of transporta-

<sup>1</sup> Dr. S. M. Lindsay, *Preisbewegung des Edelmetalle seit 1850*. Jena, 1893.

tion and superior organisation of industry under the management of the joint-stock company are still other causes enumerated.

The U.S. Senate report has reduced all the above tables for statistical measurement to a common basis of comparison for relative prices based on the year 1860, which is regarded by that committee as a normal year. Considerable material has also been collected in this report on the changes in wages.

[For the best and most comprehensive collection of material on the period 1850-91 consult "Retail Prices and Wages," *Report of Finance Committee, U.S. Senate*, Washington, 1892, 3 vols.; and more particularly, "Wholesale Prices, Wages and Transportation." Report by same committee with analysis of tables by Prof. Roland P. Falkner, Washington, 1893, 4 vols.—Tooke and Newmarch, *History of Prices*, vol. vi. The last two volumes of this history are very scarce, because the history was issued in single volumes and almost the whole edition of vols. v. and vi. was destroyed by fire before any very large number had been sold. There is an excellent German translation with a good introduction and many valuable notes and additions by the translator.—*Die Geschichte und Bestimmung der Preise während der Jahre 1793-1857*. Von T. Tooke und W. Newmarch, Deutsch, und mit Zusätzen versehen von C. W. Asher, Dresden, 1859, 2 bde. For two detailed studies of special groups of commodities, see Lindsay, *Preisbewegung der Edelmetalle seit 1850 verglichen mit der der andern Metalle unter besonderer Berücksichtigung der Produktions- und Konsumtionsverhältnisse*, Jena, 1893, and W. Schultze, *Die Produktions- und Preisentwicklung der Rohprodukte der Textilindustrie seit 1850*, Jena, 1896.—L. L. Price, *Money and its Relation to Prices*, is a compact work dealing chiefly with the recent period. D. A. Wells, *Recent Economic Changes*, and Schönhof, *History of Prices*, are two books which lay great stress on improvements in production and cheapening of processes as causes of recent price phenomena. Soetbeer's *Materialien* and the *Journal of the Royal Statistical Society* are invaluable.]

S. M'C. L.

PRICES AND MONEY. It is generally admitted that the amount of the monetary circulation exercises an important influence on the level of average prices, though some contend that the influence is less direct than is commonly stated. Sir Robert Giffen has even gone so far as to state that "it is the range of prices as part of a general economic condition which helps to determine the quantity of money in use, and not the quantity of money in use which determines the prices."

It will conduce to clearness if we tabulate the leading conditions whose interaction is concerned in the case before us. They are:

- (i) The quantity of money in circulation.
- (ii) The amount of exchange transactions to be performed, *i.e.* the quantity of commodities to be exchanged.
- (iii) The proportion of credit to cash transactions.

- (iv) The rapidity of circulation of money.
- (v) The average level of prices.

If variation in any one of these be produced by some external influence, one or more of the others must be correspondingly modified. If, for example, an increase or decrease in (i) be produced under circumstances which do not modify (ii) (iii) or (iv), there will result an increase or decrease in (v) proportionate to the change in (i). In general some changes in these intermediate heads will accompany changes in (i), and we can then only say that a change in the amount of money in circulation tends to produce a change in the level of prices, a large change in the one tending to a large change in the other, a small to a small; while the change in (i) may be compensated entirely by changes in (ii) (iii) or (iv), and lead in actual fact to no change in average prices resulting from the change in the amount of the circulation. To state the matter otherwise, an increase in the bulk of business not accompanied by a corresponding increase in the monetary circulation will be followed by a fall in prices except in so far as it is offset by an increase in the rapidity of circulation of money or an increased proportion of exchanges effected by means of credit.

One leading difficulty in the above statement is the interpretation to be placed on the term "money." Does it include "standard" money only, or are bank-notes included? If the latter, are all included, or only such as are convertible at sight into the standard coin by virtue of legal enactments? Should token-money be also included? Should "bank money"—the amounts held by bankers, on which cheques may be drawn at any minute, by which cheques the vast majority of purchases and sales are carried through nowadays—also be included? The case seems to call for a use of the term "money," which shall reserve it to forms of money of universal acceptance. Legal-tender money would cover the ground did not local custom often override enactments conferring legal-tender power on specific forms of money. In England gold coins and Bank of England notes would be included, since the latter may be regarded in practice, spite of the fiduciary issue, to be *representative* money, forming no augmentation of the currency, being issued against the actual deposit of the material of the standard coin.

The influence of speculative credit in raising prices for a time above their normal level, and also in enabling a varying volume of exchanges to be effected without change in the volume of currency or the level of prices, when the variation is in the main of the nature of seasonal variation, has drawn attention to this cause of changing price and led to the minimising of the effect produced by the volume of the monetary circulation. As JEVONS wrote:

"Every one who promises to pay gold on a future day thereby increases the anticipated supply of gold, and there is no limit to the amount of gold which can thus be thrown upon the market. Every one who draws a bill or issues a note, unconsciously acts as a 'bear' upon the gold market." Elsewhere he directed attention to the fact that "prices and credit mutually inflate each other," but, after carefully detailing the course of prices during an inflation and subsequent collapse of credit, reached the conclusion that "prices temporarily may rise or fall independently of the quantity of gold in the country; ultimately they must be governed by this quantity. Credit gives a certain latitude without rendering prices ultimately independent of gold."

This conclusion is in fact the only sound conclusion. Prices express the relation between the amount of commodities on the one hand, and the amount of the media of exchange available for the purposes of their circulation on the other. These media of exchange are of various forms, but their amount, though subject to extensive variation, is ultimately dependent on the amount of the monetary circulation, in terms of which values are expressed, and as substitutes for which alone other media of exchange, such as cheques, promissory notes, etc., are accepted.

A frequent objection made to the statement of the dependence of the average level of prices on the quantity of money in circulation is that the variations of different prices are by no means of equal amount, and that some prices have not fallen at all during the last quarter of a century, when on the average wholesale prices have fallen 35 to 40 per cent. As well allege that the rise and fall of the tide on our coasts is not due to the tidal waves which are produced by the attractions of the moon and of the sun. Neighbouring places have tides of vastly different heights, but all would vanish were their original cause destroyed. We have spring-tides and neap-tides according to the relative position of the crests of the lunar and solar tidal waves, and clearly due to these influences, though in some places the variation is less, in others enormously more, than in the centre of the ocean. The formation of coast lines and the location of land masses modify infinitely the observable results of one common cause, while the wind may again interfere to reduce or increase the actual movement at a given place. So also with prices: they show indefinite variety of variation due to the common influence, changes in the amount of the monetary circulation, but that they do respond to that influence can be as well denied as that the tide at London Bridge is a result of the same fundamental tide-producing causes as those which affect the

tides at Teneriffe. The intensity of the result is modified by many and influential causes, the fact that it flows from a definite assignable cause cannot be disproved, and is far too important to be ignored. A. W. F.

PRICES, REAL AND NOMINAL. Price is a particular case of value (see VALUE). Value is the ratio at which a given quantity of one commodity exchanges for another. The value of any one commodity may therefore be expressed in terms of any one of an indefinite number of commodities. In communities which are in a very low state of civilization, trade is carried on to a large extent by barter (see BARTER); but, where civilization has made some progress, values take the form of prices, that is, they are expressed in terms of some one commodity, usually a metal, on account of its durability, divisibility, and certain other qualities (see COINAGE). In other words, values are expressed in *money* and termed prices (see MONEY).

The nominal price of a commodity at a given time and place is the number of units of money at which a given quantity of it is exchanged at that time and place. This nominal price depends, so far as wholesale transactions are concerned, on several factors, but more particularly on the state of the money market (see MONEY MARKET), the supply, actual and prospective, of the commodity, and the demand, actual and prospective, for it. For all practical purposes, having regard to short periods of time, the nominal price is the real price. But there are certain classes of economic investigations which necessitate the consideration of price in another aspect, namely, the quantities of all other articles for which any given article can be exchanged. If the nominal price of A now is the same as it was ten years ago, while the nominal prices of B, C, and other articles have fallen, the real price of A has risen; for the same amount of A will procure for its possessor a larger amount than before of other articles or services. Now, as the final object of any exchange of a commodity for money is the procuring of other commodities or services, the degree in which it is capable of affording satisfaction of the desire for them is the *real* price of the commodity. The "real" price of an article or service, in short, is its value expressed in terms of other articles or services. It should be specially noted that "real" and "nominal" prices at any given time and place are identical. It is only when comparisons are made between prices ruling at two or more dates that the difference between them, if any, becomes perceptible. Retail prices are governed to a greater extent than wholesale prices by custom, and often are far removed from the real value of the articles they represent. They follow the changes in wholesale prices slowly,

and usually are unaffected by the minor movements in the latter. But over sufficiently long periods retail transactions will be found to show approximately the same variation between real and nominal prices as wholesale transactions.

[J. S. Mill, *Pol. Ec.*, bk. iii. ch. vii.—Sidgwick, *Pol. Ec.*, bk. ii. chs. ii. iii. iv. and v.] W. H.

**PRICES, SHORT-PERIOD SUPPLY and LONG-PERIOD SUPPLY.** The normal supply price of many commodities may be regarded from either of two points of view, in relation to the quantity of the supply forthcoming at that price. If regard be had to the degree of difficulty in increasing the supply with such changes in the organisation of production as can be arranged at short notice, the result will be likely to be quite other than if the reference is to such adjustments of means of production to quantity demanded as require a prolonged period for their completion. If the change in demand is not expected to be permanent, the existing means of supply will not be augmented, and it is almost universally true that an increase in the amount demanded raises the short-period normal supply price. But if it is anticipated that the demand will be permanently enlarged, the means of production will be adapted to the new conditions, and it may well happen that economies rendered possible by an enlarged scale of production may be sufficient to bring about the result that the long-period normal supply price is lowered.

If an enlarged demand is expected to be permanent, it may yet be impossible to rapidly increase the means of production, and then, during the interval when the demand can only be met from former means of supply, or with imperfect adaptation of existing means to the new conditions, the effect will be similar to that of the case where no permanent change of demand is anticipated. A reduction in demand will be dealt with similarly to an increase, and if the reduction is expected to be only temporary, or if the means of production can only slowly be reduced to correspond with the new state of things, there will be, for a time, circumstances in which the supply price is determined with but little reference to permanent conditions, that is, the short-period normal supply price and the long-period normal supply price will not coincide.

These two terms have reference therefore to equilibria of demand and supply when there are taken into consideration, respectively, the immediate and temporary situation, and the situation which is produced by the gradual adjustment of productive means to more permanent conditions of demand. It need hardly be added that there is no hard and fast division between "long" and "short" periods.

[Marshall, *Principles*, bk. v. chs. v. and xii., and a paper privately printed by Mr. H. Cunyngame,

*Some remarks on Demand and Supply Curves and their Interpretation.*] A. W. F.

**PRICES, THEORY OF.** Any theoretical discussion of price is closely allied to that of value. Values find their concrete expression in prices. Price may therefore be defined as the value of one commodity in terms of another (see **VALUE**). The price of a pound of coffee is theoretically a half bushel of wheat in a market where a half bushel of wheat is exchanged for a pound of coffee. In more general usage, however, price has reference to the value of a commodity expressed in terms of some general standard commodity which is used as money. Professor Hadley says: "A price is a fact. A value is an estimate of what a price *ought* to be" (*Economics*, p. 91). Hardly less subtle than the analysis of value is that which is necessary to determine the factors that enter into and explain fluctuations in price. In every economic transaction in which price enters, there are four variables which exert an influence in determining what the price shall be; the value of the commodity to the buyer, the value of money to the buyer, the value of money to the seller, and the value of the commodity to the seller. These four sets of values are each determined a separate equation of the law of supply and demand, and all four equations of supply and demand vary somewhat whenever one varies, that is, they interact on each other (see **MONEY**).

Price may equal the cost of production in any particular market. For commodities which require no costly machinery to produce, where no large stock of the commodity exists, where the demand is uniform and strong, and where the supply can be readily increased or diminished, the price does tend to equal the cost of production determined by the cost of producing the marginal increment consumed, or that portion of the product produced under the most disadvantageous circumstances. This is known as normal price (F. A. Walker, *Political Economy*, p. 100). Such conditions rarely, if ever, exist, and the market price is in reality a variation from the normal price due to the action of the other variables, to which reference has already been made. Auspitz and Lieben, in their painstaking inquiry into the theory of prices, and in their efforts to give their results the form of mathematical precision, accept as a fundamental proposition that the price of a commodity equals the utility of the last or marginal increment purchased, as well as the cost of the marginal increment sold.

Marshall has added to the clearness of his discussion by introducing the terms demand-price and supply-price. He states thus the law of supply and demand in its bearing on demand-price: "An increase in the amount of a thing that a person has will, other things being equal (*i.e.* the purchasing power of money,

and the amount of money at his command, being equal) diminish his Marginal Demand-price for it" (Marshall, *Principles of Economics*, 2nd ed. vol. i. p. 152). Here again, three variables are eliminated for the purpose of discussion, and only one considered. Another quotation will show his use of these terms. It is found on page 195 of the *Principles*: "As the price required to attract purchasers to any given amount of a commodity was called the demand-price for that amount, so the price required to call forth the exertion necessary for producing any given amount of a commodity may be called the supply-price for that amount." The equilibrium between demand and supply price is one of the most interesting and intricate problems of modern economics, and the one to which Professor Marshall has contributed the best discussion in bk. v. of his *Principles*.

Prices may be considered either as wholesale prices or as retail prices. Wholesale prices are much more sensitive to competition, and are, generally speaking, much more capable of being readily reduced to economic law than are retail prices. The latter are more influenced by custom, and reflect with greater emphasis the variations in consumption.

Prices are furthermore to be considered, from a theoretical point of view, as monopoly prices, when special conditions such as scarcity, legal privileges, etc., affect the equilibrium of supply and demand of the commodities offered in a given market; as panic prices, when special conditions affect the monetary standard; as luxury prices, when the value of the monetary unit is small for a given consumer; as crisis prices, when special conditions affect the seller of commodities in a falling market.

Even in its narrowest limits, excluding the prices for services and for land as belonging to other departments of economic inquiry, the theory of price must cover a very broad field. It should endeavour to explain the phenomena of price primarily in their psychological significance as a question in the balancing of final utilities where several variables are concerned. In the second place it should endeavour to account for the concrete manifestations of these psychological phenomena in the economic facts of an average market. Here it is evident that no one theory or rather no one principle can be made to explain satisfactorily all the phenomena. We find, rather, several theories explaining various groups of phenomena and dealing with various kinds of prices as enumerated above. These must be considered as collectively constituting a theory of prices. Finally, there is a third problem depending partially on economic considerations and partially on social factors, namely, the question of the stability of prices. This is really a problem in distribution, but its significance cannot be ignored from the point of view of price theory.

[All the text books on political economy treat of the theory of prices. See especially, Marshall, *Prin. of Econ.*, vol. i.—J. S. Mill, *Prin. of Polit. Econ.*—Cairnes, *Pol. Econ.*—Hadley, *Economics*. The best special treatment of the subject is found in Jevons's *Theory of Pol. Econ. and Investigations in Currency and Finance*.—Zuckerkanndl, *Theorie des Preises*.—Auspitz und Lieben, *Untersuchungen über die Theorie des Preises*.—Wieser, *Der natürliche Wert*, and "The Theory of Value," *Annals of Amer. Acad.*, vol. ii.—Smart, *Introd. to Theory of Value*.—Böhm-Bawerk, "Wert-Kosten u. Grenznutzen," in *Jahrb. d. Nat. ökon.*, iii. Folge, Bd. iii. also art. on "Ultimate Standard of Value," *Annals of Amer. Acad.* vol. v. On the problem of distribution in relation to stability of prices, see Patten, *Dynamic Economics*, Phila., 1892, and "The Stability of Prices," *Amer. Econ. Assn. Publications*, vol. iii. (See MONEY; VALUE; PRICES, HISTORY OF.)] S. M'G. L.

PRIME: *Fr.* (1) BOURSE; (2) COMMERCE. A contract on French markets for public securities analogous to the CALL in options on English stock exchanges. The *modus operandi* is, however, different, and the converse operation of the *put* is not practised (see PUT and CALL). The *prime* is the forfeit paid by the buyer to cancel a conditional purchase at the next or second account forward. The amount of the *prime* is included in the price, which is consequently higher than that which would be paid in the case of an unconditional purchase, and the margin between the latter price and the price "*à prime*" is wider in inverse proportion to the amount of the *prime* or forfeit. Where the amount of the *prime* is small, as it forms the limit to the profit of the seller, he demands a higher price than with a large *prime* as he is more exposed, in the case of a rise, to have to buy in at a loss to deliver the stock. The *primes* for French *rentes* are 25 or 50 centimes, or 1 franc. For shares five francs or multiples of that sum. *Primes* are distinguished in bourse quotations by the addition of the word *dont* (of which) or *d.* to the price. For example, French 3 per cents, at 102 francs *dont* 25 centimes, means that the buyer may take up the stock at 102 francs or pay the forfeit of 25 centimes.

The *réponse des primes* or declaration of options takes place at 1:30 in the bourse of the day preceding the account, that is to say, on the 15th and last day of the month. The quotations at that hour are posted, and the buyer may then calculate whether it is to his advantage to make the purchase firm or pay the *prime* to cancel it. In practice the broker usually decides this for him, instructions being only necessary when the profit or loss would come out about the same either way.

(2) PRIMES (commerce) are bounties in various forms to encourage or protect native industry or production, and enable it to compete with foreign countries. *Primes de construction*

for shipbuilding date as far back as the time of COLBERT ; they are a payment by the State per ton on ships built in France as a compensation for the higher cost of the materials employed, caused by the protective duties on iron and timber. *Primes de navigation* are paid per ton per thousand miles run, the coasting trade excepted. *Primes de pêche* are paid first per head of the crews employed in the cod-fisheries, to favour the recruitment of the navy, and next on the fish taken to enable French fishers to under-sell their rivals in Italy, Spain, and other Roman Catholic countries where the consumption is large. *Primes* have increased in number since the revival of protection in late years, and are granted to home producers of articles not protected by customs duties, as on raw silk, flax, and other textiles ; or on shale, to counter-vail a reduction in the duty on imported petroleum ; by a drawback on cotton yarn employed in the manufacture of certain mixed stuffs for export, even when no duty has been previously received, as when the cotton yarn is of French manufacture, etc. It is doubtful whether these *primes* have really contributed to the prosperity of French industry, but producers have succeeded in persuading the government and parliament that they could not exist without them.

T. L.

PRIMER SEISIN was the right of the kings of England after the Norman Conquest to exact, on the death of a tenant-in-chief, from the heir, if of full age, one year's profits of the land in addition to the ordinary relief. It originated in the king's right to enter upon the land on the tenant's death as security for the payment of relief and as a defence against intruders. The common practice of suing for livery of seisin within a year and a day after the decease of the previous tenant would fix the period covered by primer seisin at one year. Heirs who were minors, and therefore wards of the king, did not pay primer seisin on reaching their majority ; and only half a year's profits were due from a successor whose possession of the estate was subject to a life interest,—in legal language, who had the reversion expectant upon an estate for life. This charge fell into desuetude with other feudal incidents, and was finally abolished in 1660 by 12 Car. II. c. 24. A law enacted in France in 1245 by St. Louis gave the king a year's possession of the land of a deceased tenant, but only in default of relief. The papal claim to first-fruits was modelled on the feudal primer seisin.

[Coke upon Littleton, 77a.—Blackstone's *Commentaries*.—Hallam, *Middle Ages*.—Gneist, *Eng. Const.*]

E. G. P.

PRIMOGENITURE. The name of primogeniture is given to the law or custom in virtue of which an eldest son succeeds either to the sovereign power or to the landed estate of his father, either in default of or to the exclusion

of any testamentary disposition. The rule of primogeniture has prevailed more widely with reference to political power than with reference to property. It is obviously for the general good that the authority of a king or chief should not be liable to division on his decease, but should pass in its entirety, if possible, to an adult man. In some countries the eldest son has been passed over in favour of the eldest male of the reigning house. But this practice rests on the same reason which has usually led a people to prefer the eldest son, namely, the inconvenience of a minor's rule. There is no equally forcible reason why the estate of a private person deceased should go entirely to his eldest son, leaving the other children unprovided. Primogeniture in this sense is the exception, not the rule. It was unknown to the legal systems of antiquity and of the east. It was also unknown to the German conquerors of the Roman empire. In England primogeniture as a rule of succession to private property was unknown before the Norman conquest. Primogeniture, in this sense, is a distinguishing mark of feudalism. Under the feudal system each man's status depended on his relation to the land. Each landowner in his degree discharged definite civil and military functions, and was so far a partaker in sovereign power. As the possession of land conferred this public character, it was natural that the estate should be treated like a little kingdom, should be considered indivisible, and should go to the eldest son. The opposite principle of equal subdivision would have broken up the civil and military hierarchy in one or two generations. The government of a province or the command of a regiment does not admit of partition between the sons of a late governor or a late colonel. Accordingly the rule of primogeniture is said to have been first established with respect to the *beneficia* or grants made by the Frankish sovereigns on condition of personal service. With the progress of feudal tenure it spread over most of central and western Europe. The history of the rule in Italy, Germany, France, and Spain is far too intricate to be even summarised here. As each of these countries was broken up into territories more or less independent, and as within each territory local custom was diversified and tenacious of life, the rules of succession differed indefinitely from place to place. Even in the same district the nobles often lived under one law, the burghers under another, and the peasants under a third, so that one class might accept and another class might reject the principle of primogeniture. The revival of the Roman law affected the principle differently in different states, but upon the whole tended to weaken it. Thus on the continent the idea of primogeniture never attained universal or unqualified acceptance. In England, a small country united betimes

under a strong central government, the rule of primogeniture, once introduced by the Normans, prevailed more rapidly and completely than elsewhere. It was well established by the end of the reign of Henry III., although the old custom of equal division between all the sons (GAVELKIND) held its ground in Kent and in a few other places. But as women were incapable of personally discharging the feudal service due for their lands, the rule of primogeniture was not applied to daughters succeeding in default of sons. They took and still take equally as co-parceners. As the power to make a will of lands was lost in the feudal period of English law, the father was unable to modify the rights of the eldest son. But when the testamentary power was restored, at first by the invention of uses (beneficial interests in land distinct from the legal estate and protected by the chancellor), and afterwards by the acts 32 Hen. VIII. c. 1 and 12 Car. II. c. 24, the rule of primogeniture became merely a rule of intestate succession. There exists no law compelling the father to leave his land to the eldest son. Large estates in the United Kingdom do commonly pass undivided to the eldest son, but this is not the result of any law. It is the result of a custom of making settlements with provisions to that effect. The custom has survived to our day because the political and social importance of a family has in a great measure depended on the landed possessions of its chief. In France and in the countries subject to the influence of France, the rule of primogeniture was abolished by the revolution. The CODE NAPOLEON makes subdivision compulsory. As a political expedient in a feudal society the rule of primogeniture had its uses. As a law, or even as a custom of succession to landed property in modern times, it has been severely criticised, as (1) contrary to the feelings of justice and affection which prompt a parent to provide equally for all his children; (2) corrupting to the eldest son who obtains the whole of the estate by the mere accident of birth, and cruel to his brothers and sisters who have been brought up in affluence and often spend the rest of their lives in penury; (3) injurious to the land, which is frequently starved by the tenant for life in order to provide portions for his younger offspring; (4) discouraging to industry and thrift, inasmuch as it keeps estates few and large, thus withdrawing land from commerce and hindering the application of capital to land. On the other side it has been urged (1) that in the long run the importance of a family is an advantage to every member of that family; (2) that the proprietors of large estates are often liberal and enterprising in improvement; (3) that younger sons are often bold adventurers, and that adventurers are essential to national greatness. A law of compulsory subdivision may have bad effects in

diminishing the size of properties beyond the limit compatible with high cultivation or in checking too strongly the natural increase of population. Complete or at least liberal powers of testation with a rule of equal division in case of intestacy appear to be most conducive to the welfare of a modern community. There is little doubt that the English law of intestacy will be remodelled, and that the English custom of settling all the land on the eldest son will be modified as large estates lose by degrees the attractions which they formerly possessed.

[See BEQUEST, POWER OF; ENTAIL, Law of, and authorities cited; LAND, Law relating to; TAXATION; TAXATION on Property and Income. Maine, *Ancient Law*.—Pollock and Maitland, *History of English Law*.—Digby, *History of the Law of Real Property*.—Cecil, *A Short History of Primogeniture*.] F. C. M.

PRINCE-SMITH, JOHN (1809-1874), born in London, was the son of a governor of British Guiana. He went to Germany in 1830, and employed himself there for some years in teaching English, settling at Berlin in 1846. From 1861 to 1866 he sat for Stettin in the Prussian house of representatives, and from 1871 to 1873 for a division of Anhalt in the German Reichstag. He died at Berlin.

Prince-Smith was the founder, and for a long time the head, of the German free-trade party. He was a member of the Cobden Club, and established a free-trade society in Berlin. Originality could scarcely be expected in a preacher of doctrines already fully expounded by Adam Smith, Say, and Bastiat, and popularised by Cobden and others during the English anti-corn law agitation. Those doctrines he put forward in their most absolute form. Unlimited freedom of industry was, according to him, the one condition of the economic well-being of a community, and the individual desire of gain the necessary and sufficient stimulus of economic activity. The state, he thought, had nothing to do but stand by and prevent fraud or violence from disturbing the process of social competition. He pays no attention to moral considerations or to patriotic motives, and holds that private profit implies public gain. Even those who differ most widely from these views admit that he did much useful work in connection with legislation on banks, coins, weights and measures. His entire school, too, notwithstanding its one-sidedness and its positive errors, has rendered important service by opposing the extremes of German protectionism, and by its energetic warfare against monopolies, unnecessary restrictions, and mediæval survivals.

Prince-Smith's collected writings were published in 3 vols., 1871-1880, by O. Michaelis and K. Braun, with a biographical sketch by O. Wolff.

**PRINCIPAL.** This word is used in popular language, and also in legal documents, to distinguish the original amount of a debt from the interest payable thereon. Thus for instance, in a transfer of a mortgage, "the said principal sum of £— (being the amount of the original mortgage debt), together with interest due or to become due thereon," is assigned to the transferee.

E. S.

**PRINCIPAL AND AGENT.** An agent is a person who is employed to do an act on behalf of another called the principal, so that as a rule the principal himself becomes bound. That one person can represent another is a doctrine that has developed but slowly. In Roman law it was a general principle that no one could enter into a contract by stipulation on behalf of another, and in the case of mandate the mandatarius or quasi-agent incurred a personal liability towards their parties (see **MANDATUM**). The modern principle is that contracts entered into by an agent are regarded as entered into by the principal, provided the contract is within the scope of the agent's authority.

No special form of words is required to appoint an agent, and agency may be inferred from the conduct of the parties. An agent is required to conduct the business entrusted to him with as much skill as is generally possessed by persons engaged in a similar business, to act with reasonable diligence, to display the utmost fidelity, to keep proper accounts, and to pay over all moneys received less any expenses and his own remuneration.

Directors, managers, clerks, and servants, having power to act for their principals or masters, are agents. Besides these, the chief classes of agents are (a) **FACTORS** (*q.v.*); (b) **BROKERS** (*q.v.*); (c) auctioneers; and (d) ship masters. Each class is subject to the usages of the trade relating to the class. An agent cannot as a rule delegate his powers, but by the custom of certain trades sub-agents may be employed. The relation of principal and agent is terminated by mutual consent, by revocation, by the agent renouncing, by the expiration of the time agreed upon by the completion of the business, by the death or lunacy of either principal or agent, and by the bankruptcy of the principal.

[Evans on *Principal and Agent*, London, 1888.—Campbell on the *Sale of Goods and Commercial Agency*, London, 1891.] J. E. C. M.

**PRINSEP, CHARLES ROBERT** (1789-1864), translated into English J. B. Say's *Traité d'Économie Politique*. He published *A Letter to the Earl of Liverpool on the present Distress of the Country, and the efficacy of raising the Standard of our Silver Currency*, 1816. M. Blanqui (*Dict. de l'Écon. Pol.*) remarks that "this curious letter is an indispensable part of the discussion on paper money which arose in England after the events of 1814, and on the

occasion of the proposal to resume payments in specie."

Prinsep also published *An Essay on Money*, (London, 1818, 8vo), of which the same authority remarks: "This writing is much and justly esteemed in England for its lucidity and its excellent exposition of the subject." A. L.

**PRIOR, THOMAS** (1682-1751), co-founder and secretary of the Dublin Society for promoting husbandry and other useful arts in Ireland, 1731, wrote four economic treatises on Ireland.

In *A List of the Absentees of Ireland and the Yearly Value of their Estates and Incomes spent abroad*, 1729, 2nd ed., 1729, reprinted in *A Collection of Tracts and Treatises illustrative of Ireland*, 1860-61; (the 6th, miscalled 3rd, ed., 1769, is a new book not by Prior). Prior reckoned on the debit side of the balance of trade payments to absentee landlords, employees, and pensioners, etc. The idea was taken from Sir W. PETTY, *Pol. An. of Ireland*, 1672, pp. 72, 73, 84, and *Report*, 1676, who improved on a hint from T. MUN, *Eng. Treas.*, 1664, p. 215. But Petty's results—acclaimed by Sir W. TEMPLE, 1673, and J. HOUGHTON, November 9, 1682, R. Lawrence, 1694—were guesswork. Prior, like his editor in 1769, and A. YOUNG, *Tour in Ireland*, 1779, ii. 57, made exhaustive personal enquiries, and published his items. Their results, mis cited by Lecky and others, made the total drain £621,499, 1729, £1,208,982, 1769; the drain for rent £383,700, 1729, £641,700, 1769, £732,200, 1779. The so-called estimates of Swift, *Works*, 1824, vii. 40; A. DOBBS, *Essay*, 1729, p. 51; J. HELY-HUTCHINSON, *Com. Restr.*, 1779, p. 121, Faulkner (Prior's printer), and Newenham, 1805, were based on these figures, which Boulter, *Letters*, 23rd October 1729, and Dr. JOHNSON, *Boswell's Life*, 1848, p. 277, alone pool-poohed, and on which EDEN, CAIRNES, Sir G. C. LEWIS, and Lecky, see *Hist. of Irel.*, 1892, i. 212-214, relied. This first premise of Prior's syllogism was solid: not so his second premise, which was that net exports, including baseless estimates of profits and freights, only accounted for part of the drain: and his conclusion that the rest, £240,000, was carried out in specie, thereby causing high exchange-rates and a money famine, was clearly unsound (see **ABSENTEE**). The money famine was a chronic disease aggravated by debased coins and the overrating of the MOIDORE, as Prior himself described in his *Observations*, and the precise effects of absenteeism were not understood until this century, *West. Rev.*, x. 287; TOOKE'S *Hist. of Prices*, *passim*; but it was true that exchange rates had to be abnormally high before the ebb produced the flow of money, Ireland being, as A. Young said, "cut off from the reaction of free trade," and Ireland was compelled by law to resort to the worst markets in order to pay its debts in commodities. Of Prior's two remedies a tax on absentee pensioners, etc., existed 1715-1801, but was never extended to landlords as he wished, Lecky, ii. 119, *et seq.*, and his demand, echoed from Petty, for commercial equality with England, was granted in 1779, 1782, 1800.

In *Observations on Coin in general, with some Proposals for regulating the Value of Coin in*

Ireland, 1729, reprinted by the Political Economy Club with preface by McCULLOCH (q.v.) in *A Select Collection of . . . Tracts on Money*, 1856—Prior summarised Locke's theory of money, but repeated Barbon's idle accusation that Locke regarded the value of silver as immutable, and proved its mutability by an illustration which Locke, *Considerations*, 1691, pp. 34, 47, had already used for the same purpose, and objected to Locke's silver monometallism that if one mutable metal could measure value, two could; and with two standards (he does not understand the modern theory of alternative standards) there would be more coin. Like many others, Boulter, *Letters*, 25th Ap., 2nd May 1730, he wished English proportions among coins to prevail; yet his proposals made a crown worth more than ten sixpences and less than five shillings. His and Dean Swift's ultimate remedy was an Irish mint (Lecky, i. 449).

Prior's *Essay to encourage and extend the Linen Manufactures in Ireland by Premiums and other means*, 1749, advocated prizes rather than bounties, and expressed the then usual belief in patrons and paupers as industrial agents: his *Proposal to prevent the Price of Corn rising too high or falling too low by means of Granaries* differs but slightly from those of Lord Molesworth, 1723, and Dobbs, *Essay*, pp. 66 *et seq.* [These and similar schemes are discussed in *Letters of Lord Chesterfield*, ed. Mahon, iii. 175; *A Dialogue between Dean Swift and T. Prior*, 1753, pp. 116 *et seq.*; Cunningham, *Growth of Eng. Ind.*, ii. 307; Berkeley, *Works*, 1871, iv. 11, 329.] J. D. R.

**PRISAGE.** PRISE or PRIZE was the taking from a merchant, with or without his consent, for the king's use, of such quantity of such commodities as the custom of the time allowed. Prise, when applied to native products, was called PRE-EMPTION or PURVEYANCE, and was practised under gradually increasing restrictions till its abolition, at the restoration: when applied to imports or exports, it was called emption or caption. In the case of wine imported by denizens, the right of prise was commuted for the right to take one tun from every ship of between 10 and 20 tuns burden, and two tuns from every ship of over 20 tuns. This constitutional payment was called RECTA PRISA, in contradistinction to *mala prisa*, the old unrestricted prise, and obtained a place in the national accounts under the name of prisage or prizage of wine. Aliens importing wine compounded for the *recta prisa* by a money payment called BUTLERAGE, but were still subject occasionally to the *mala prisa*.

[Hall, *History of the Customs Revenue*, London, 1885.] A. E. S.

**PRISE.** See PURVEYANCE.

**PRISON LABOUR.** The problem of prison labour is one of comparatively modern development. Its growth is due to the gradual appreciation by society of the correctness of the view that imprisonment should not merely punish or deter, but should also reform. The appearance in 1777 of the work of John

HOWARD (q.v.), on the *State of Prisons in England and Wales*, gave an impetus to the study of the causes of crime which has led the public mind more surely to the conclusion that not only the criminal himself but his family history and the social conditions surrounding him, have to be considered. The labours of individuals such as BECCARIA, Howard, and Jeremy BENTHAM have been taken up and carried on by schools of thought in England, by Herbert Spencer, Maudsley, and others; in Italy, by Lombroso, Ferri, and their followers; and in Germany, by Krafft-Ebing and others. There have thus been laid the foundations of something like a science of criminology, in which the resources of sociology, physiology, psychology, and the study of heredity have been brought to bear on investigations connected with crime and its causes. The natural outcome of this interest, both scientific and humanitarian, in the subject has been the prominence now given to the reformatory element in imprisonment. As soon as this element is properly recognised, the importance of prison labour becomes self-evident.

What are the reformatory agencies which can be brought to bear on prisoners? They practically resolve themselves into two, the ministrations of religion, and the provision of wholesome occupation, using both terms in their widest acceptance. The good effects of work are twofold: (1) in keeping the prisoner in habits of industry or in teaching them to him; and (2) in occupying mind and hands, and so enabling him to resist the depression which is the bane of prison life. The questions follow: What is the nature of the work which can be profitably undertaken by prisoners, and What are the special conditions affecting it? It will be convenient to treat upon these under four heads.

I. In Great Britain and Ireland the view is strongly held that prison labour should be in the hands of the state itself, and not of outside agencies. But in the United States, and in several continental countries, this view does not obtain, and three systems of employing prisoners are in vogue, (a) the system of direct state control, as in our own country; (b) the contract system, where a contractor employs prisoners at an agreed price per day, to work under his agents; (c) the lease system, under which a contractor leases prisoners for a fixed period, and, in most cases, undertakes to feed them and to maintain proper discipline amongst them while employed on the work specified in the lease. From the admirable report of the United States Commissioner of Labour issued in 1886 it appears that out of 64,349 prisoners, 33,290, or more than half, were employed on the contract (23,591) or lease (9699) systems. There is no space here for a full discussion of the intrinsic merits of

the three systems, but it will be enough perhaps to point out that the contract system opens the door to serious competition with free labour, and the lease system is exposed to abuses, many of them identical with those which put an end to transportation and closed the British colonies to convicts. It is certain that public opinion in England, the most thoroughly organised industrial country in the world, would tolerate neither.

II. Next to be considered are the peculiar conditions of prison life. In most countries there are two classes of prisons, for long-sentence and for short-sentence prisoners. In the former class of prisons—known as convict or public works prisons at home—the difficulties connected with prison labour are minimised. Convict prisons are situated either in the open country (*e.g.* Dartmoor), or in proximity to public works (*e.g.* Portland, Borstal, and Peterhead). After their first nine months of separate confinement—a period which seems likely to be shortened,—convicts can be placed at associated labour on public works such as breakwaters, harbours, ports, or new prison buildings, or on land-reclamation, farming, and quarrying. All convicts are so employed unless found either too delicate for hard work in the open or specially qualified for indoor occupation.

In short-sentence or local prisons the matter is more complicated. There prison labour may be of two kinds—unproductive (*e.g.* the crank or treadwheel) and productive; and the latter may be either cellular or associated, and either skilled or unskilled. Very little can be said in favour of unproductive labour, which is universally conceded to be brutalising in effect. Practically it is only retained in English prisons to carry out the provisions of the law requiring prisoners sentenced to hard labour to be kept for a month at hard labour of the first class, and as a means of punishment for offences committed within the prison. As such it is likely to be given up so soon as an efficient substitute can be devised. Whether productive labour should be cellular or associated has been a debateable point. In order to avoid contamination, prison reform has tended to keep prisoners so far as possible from intercourse with one another. Almost all modern prisons, at home and abroad, are therefore built on the cellular principle. But for purposes of labour, associated workshops have obvious advantages over cells. Work and the appliances for it—*e.g.* machinery, can be of a far more elaborate and therefore educational character, and the effect on the mind of work in company with others, even though general conversation be forbidden, is healthier. As to contamination there is the experience of associated labour in convict prisons to show that the danger can be obviated. The consideration of the whole

question is tending in England to the general adoption of a salutary compromise whereby prisoners shall have their meals and sleep in separate cells, but shall work in associated workshops under strict supervision.

Further difficulties are the fact now universally conceded that prisoners are below the average in mental and physical capacity, and the shortness of the term which many of them have to serve. On 6th March 1894, out of 14,582 prisoners in English local prisons, 3383 were in for four weeks or less, and 7024, or nearly half, for three months or less. All these would not be unskilled workmen, but prisoners have a natural inclination to conceal their trade, and it is possible a man may serve the whole of his term without its being discovered what is the trade to which he could be set without preliminary instruction. Besides skilled labour there must thus be provided in prisons the means for rough unskilled labour, rising from oakum-picking or stone-breaking, and the like, to sack and mat-making.

III. There follows the danger of competition with free labour. This, statistically viewed, is less important than is sometimes imagined. The danger is largely a sentimental one, but is none the less deserving of consideration on that ground. The annual value of the labour in English local prisons, *including* the domestic services of the prison, is estimated at less than £120,000, which is clearly an infinitesimal proportion of the trade of the country. Certain industries are practised in English prisons; comparing the numbers of prisoners employed in them with the census number of persons engaged in the like occupations outside, and reckoning the amount of a prisoner's work to be but half that of a free workman, the proportion stands as one prisoner to 1886 free workmen, or, with all possible developments of prison labour in the future, as one prisoner to 1587 free workmen. In the United States the Commissioner of Labour estimates the competition in particular trades as much higher, but reckons a free labourer to be worth 1·27 prisoners, not two, as in the proportion which forms the basis of the calculation in the preceding sentence. Perhaps in individual trades at home, specially suited for prisons and not largely engaged in outside, *e.g.* mat-making, the amount of competition is appreciable. But the fact remains that the average annual value of an English convict's labour is not estimated at more than £27, nor of a local prisoner's at more than £8. The Austrian estimate is not higher than £3 per head for the three years 1889-91.

The attitude of trades unions to prison labour has been somewhat misunderstood. No doubt, as in the case of mat-making, particular trades have imagined that their interests were menaced, and have done their best to abate certain industries. But at the

Trades Union Congress at Belfast in 1894, a proposal to condemn industrial work and training in reformatory and industrial schools was rejected. Authoritative trades union opinion seems to be in favour of the industrial training of prisoners, and not to object to the sale of prison-made goods, for the relief of taxation, provided (a) that they are not sold below market prices, and (b) that every consideration is paid to the special circumstances of particular trades outside the prisons.

In order to minimise undue competition with free labour the principle has been generally adopted of directing the energies of prisoners so far as possible to the construction of public works and the supply of articles required by the prison service itself or other departments of government. Thus, long-sentence prisoners in England built Wormwood Scrubs Prison, Portland breakwater, and the Chatham forts, and short-sentence prisoners have helped to meet the demands of the Post Office for belts, pouches, mail-bags, and the like, of the Admiralty for coal-sacks, hammocks, baskets, mats, etc., of the War Office for bed and bolster-cases, rugs, oil-cans, etc. Here of course what the country loses in wages it gains in relief of taxation. The surplus of articles is sold, care being taken not to sell below market prices, nor to make any particular article in such quantities as to disturb the equilibrium of the market into which it enters.

It is, perhaps, right to mention here that complaints have been rife in England for some time that the importation of prison-made goods from Germany and other countries has seriously depressed the market for the same goods at home. The extent of the mischief, whether appreciable or not, was so much canvassed that in the first session of 1895 a departmental committee of the Board of Trade was appointed to investigate the subject. Its report was to the effect that no cause had been shown for the necessity to take steps to restrict the importation of prison-made goods, and that if cause were shown no steps could be taken which would not produce more harm than good. Nevertheless, there is reason to believe that negotiations have been entered into with foreign governments in order to check if possible a competition which, slight or severe, is objectionable in itself. Of exportation as a means of disposing of prison-made goods practically no use is made in this country.

IV. The fourth consideration is twofold; to what extent should prison labour be directed with a view of making the prisoners pay for their own maintenance, and to what extent should prisoners receive money payments for their work. It is clear that in a system whose main end is the reform of the prisoner, the desire to make pecuniary profit out of his labour will hold no place inconsistent with the

primary object. Regard will not be had as to whether or no a saleable article will be produced, but the prisoner will be set to such labour as is most likely to fit him for earning an honest livelihood after discharge, or is most suited to his physical or mental condition. But as a matter of practice, the two run very much together, and most of the work to which it is desirable and possible to set prisoners results in the production of saleable articles.

A compromise must be effected, and the natural desire to find the state a fair set off against the cost of the prisoners' maintenance must be held in check. Herein subsists one of the main arguments in favour of the direct control of prison labour by the state, for pecuniary profit is far less likely to become the main object under that system than under either the contract or lease systems. As to whether prisoners should receive pay for their work or not, general opinion is in favour of granting them gratuities proportioned to their industry. The objects are of course to encourage the prisoner to work and to secure to him a bonus against the day of discharge; and care should be taken that the amount of the gratuities is not larger than is necessary to fulfil those objects. Even in so developed a prison system as that of England this question has not received the attention it deserves. At present the maximum which a local prisoner can earn is 10s.—a sum adequate neither as a spur to work nor as a bonus. In most foreign countries larger gratuities can be earned, but there prisoners are allowed to spend a portion of their earnings in procuring creature comforts, better food, coffee, and even in some cases cigarettes, from the prison canteen. Such a disposal of prisoners' earnings is not tolerated in England, and probably on the whole rightly so.

In conclusion it may be useful to direct attention to the care which has recently been devoted in this country, under the auspices of government, to the consideration of the questions treated of in this article. An important departmental committee of the home offices published a report in 1895 (see reference below), in which the subject of prison labour is dealt with exhaustively. The spirit in which that committee approached the question is modern, but, after all, not more modern than Jeremy Bentham, who said: "Occupation, instead of being the prisoner's scourge, should be called, and be made as much as possible, a cordial to him. It is in itself sweet in comparison with enforced idleness; and the produce of it will give it a double interest. The mere exertion, the mere natural energy, is amusement, when lesser ones are not to be found. Taken in this point of view, industry 'is a blessing; why paint it as a curse?'"

[In addition to the works of the writers mentioned in the text, reference may be made to

Sir E. Ducane, *Punishment and Prevention of Crime*.—Dr. Mouat's paper on *Prison Ethics and Prison Labour*, read before the Royal Statistical Society, 17th March 1891, to the report of the United States Commissioner of Labour, issued in 1886, and to the following official papers—*Prison Committee's Report with Appendices* (c. 7702 and c. 7702 I.), 1895—*Report of Departmental Committee on Habitual Offenders in Scotland with Appendices* (c. 7753 and c. 7753 I.), 1895—*Report of Departmental Committee on Importation of Foreign Prison-Made Goods* (c. 7902), 1895: and *Foreign Office Commercial Series*, No. 8 (1894), reports on prison labour in certain foreign countries. — Foreign Prison-Made Goods Act, passed 1897.] J. G. L.

PRIVATE INTERNATIONAL LAW. See INTERNATIONAL LAW, PRIVATE.

PRIVATE PROPERTY. See PROPERTY.  
PROBABILITY AND CALCULUS OF PROBABILITIES. Probability means a greater or less degree of credibility. The probability of an event is measured by the frequency with which it has occurred in past experience. Thus the probability of an ace turning up when a die is thrown is one-sixth, since it has been observed that in the long run one side of a die turns up about once in six times (Venn, *Logic of Chance*), and other regularly-shaped bodies present analogous proportions. From statements of frequency given by experience the calculus of probabilities deduces, often by a long chain of mathematical reasoning, statements of frequency—affording measurements of credibility—which could not easily be proved by experience. Thus, if it is given that when a coin is tossed heads turn up as often as tails, it is deducible that, when a hundred coins are tossed, it is hardly credible that as many as seventy of them should present heads. The odds against such an event are many thousands to one. It is more than an even chance that the number will be between forty-six and fifty-four inclusive. The calculus of probabilities may be similarly employed to give confidence in the uniformity of our results in many statistical problems which concern economics; in particular the determination of the average variation of prices, and the average variation of wages (Bowley, "Changes in Average Wages," *Journal of the Statistical Society*, 1895; see arts. ALEATORY; ERROR, LAW OF; INDEX NUMBERS; TABULAR STANDARD).

[Of the two elements distinguished by Laplace in his definition of *Probabilities* as "good sense reduced to calculation," the latter is more prominent in most of the treatises, the former is found in the greatest purity in Laplace's *Essai Philosophique sur les Probabilités*—bound up with his severely mathematical *Théorie Analytique des Probabilités*, and in Dr. Venn's *Logic of Chance* (3rd ed.). Prof. Karl Pearson, in his *Grammar of Science*, explains with authority the foundations of an edifice which he has elsewhere contributed to raise. The definition and evidence of prob-

ability are examined in an article on the "Philosophy of Chance" in *Mind*, 1894, by Prof. Edgeworth. Some applications of the calculus to affairs are suggested by him in his book entitled *Métematique*, 1887, and in an article "On Some Applications of the Calculus of Probabilities" in *Journal of the Statistical Society*, September and December 1897 (pt. i., Bimetallism; pt. iv., Elections).] F. Y. E.

PROBATE. When an executor of a will has any occasion to assert his right as executor he must show that he has proved the will, which he does by producing a copy of it, called the probate, sealed with the seal of the court of probate. The probate is legal evidence of the will. Scotch and Irish probates may be resealed in England, and then have the same effect as if granted in England.

[Williams, *Law of Executors and Administrators*, 19th ed., 1893.] J. E. C. M.

PROCÈS VERBAL (Fr.). An official report drawn up by a public officer or administrative agent to testify to acts or to infractions of the law witnessed by him or of which he has cognisance, and which may serve as a basis for ulterior proceedings. The officer or agent can only *verbalise* relative to acts within his competency; as, the rural policeman for trespass, poaching, etc.; the customs or excise officer for frauds on the revenue; the notary for inventories, the placing of seals, etc.; the bailiff for the service of writs or to declare the absence of parties, etc. The *procès verbal* must contain a brief statement of the facts with the date and signature, written on stamped paper, if on blank paper it must be registered for stamping, the duty being included in the costs. Minutes of the meetings or proceedings of associations, companies, legislative or other bodies, are called *procès verbaux*. T. L.

PROCLAMATIONS nowadays may be termed administrative or executive orders issued in accordance with law by the privy council in the name of the sovereign; but in earlier times, particularly under the Tudors and Stuarts, in the 16th and 17th centuries, they were used to supplement legislation and perhaps occasionally to supersede it. According to the spirit of the times, economic and financial matters were often the subject of royal proclamations: alterations of coinage under Henry VIII. and Edward VI.; exportation of money and other commodities, cultivation of wood, regulation of dress, under Elizabeth; increase of London and manufacture of starch under James I.; fixing of prices and interference with tradesmen and artisans under Charles I.—all these and many other subjects, besides ecclesiastical and political affairs, were dealt with by the royal power acting by advice of the council, independently of parliament and often without reference to common or statute law.

[Proclamations were like the earlier ordinances in council. Gneist (*Const. Hist.*) makes no dis-

tion between the two.—Coke, *3rd Inst.*, 162.—Blackstone, *Commentaries*, 270.—Rymer.—Clarendon, *Hist. of the Great Rebellion*.—Hallam, *Const. Hist.*—Gardiner, *Hist. of England*.—Stat. 31 Hen. VIII.—Stat. 40 & 41 Vict. c. 41 (for publication of proclamations).—*A booke of Proclamations*, 1603-1612. The most complete list of proclamations is that in Earl Crawford's privately printed *Handlist*, 1509-1837, 2 vols. fol.]

E. G. P.

**PROCURATION BY SIGNATURE (BILLS OF EXCHANGE).** By § 25 of the Bills of Exchange Act 1882, a signature by procuration (e.g. p.p. Smith and Co., John Jones) operates as notice that the agent has but limited authority to sign, and the principal is only bound by such signature if the agent in so signing was acting within the actual limits of his authority. Where the agent indorses a bill in excess of, or without, authority, the indorsee acquires no title, but in the case of a demand draft drawn on a banker, the paying banker is protected by § 60 as he would be in the case of a forged indorsement. [Chalmers, *On Bills of Exchange*, ed. iv. p. 375.]

M. D. C.

**(MERCANTILE USAGE GENERALLY.)** It is common practice among bankers and merchants in all parts of the world to appoint managers with full powers to incur obligations on behalf of their employers, and authorised to represent the latter in all business transactions. German mercantile law recognises this custom by giving a special name, "prokurist," to persons occupying such a position, but the signature with the letters p.p. (*per procurationem*) in front of the firm name of the employers, is used in all civilised countries. In English law, and according to the law of some continental countries, the powers of a person occupying the above-described position are not in any way defined, and the employer may in any given case dispute his liability on the ground that the manager had been acting in excess of his powers. The German mercantile code provides (§ 42) that the "prokurist," who must be registered as such in the mercantile register, has power to transact on behalf of his principal any business of a mercantile character, not including transactions for the sale and mortgage of real property, and that (§ 43) a restriction of these general powers has no effect on third parties. To persons not familiar with mercantile usage these provisions seem very far-reaching, but any one accustomed to business transactions, in the city of London or elsewhere, will know from experience that signatures "per procuration" have constantly to be accepted without question or inquiry as to the powers of the persons so signing, and if it were generally known that the binding character of the signatures so given might at some future time be disputed by the principals, more eagerness would be shown for an alteration of legal rules which honest traders will not take advantage of, but which are liable to be abused by unscrupulous persons.

E. S.

**PRODIGUS.** According to Roman law, if a person of full age spent his property in a reckless manner, the magistrate might, on

application being made to him, interdict such spendthrift from administering his property, and assign the care of it to a curator, as in the case of a lunatic. As to modern instances of this practice, see **INTERDICTION**. E. A. W.

**PRODUCE** and the group of words derived from it, of which Product, Production, Productive, and Unproductive are the chief, cannot strictly be said to have been first used as technical economic terms by the **PHYSIOCRATS** (*q.v.*). **CANTILLON** (*q.v.*), writing long before **QUESNAY** (*q.v.*), speaks of "proportioning the production of merchandise and commodities to their consumption" (*Essai sur la nature du Commerce*, p. 38), and Adam **SMITH**, lecturing before he had come under physiocratic influences, shows how "division of labour occasions a multiplication of the product, or, which is the same thing, how opulence arises from it" (*Lectures*, p. 163). But the discussions which have given the words their importance in economic terminology, have their starting-point in the *Tableau Économique* (see **QUESNAY**; **PHYSIOCRATS**). In this the community's expenditure is divided into *dépenses productives*, devoted to agriculture and procuring raw materials; *dépenses stériles*, devoted to manufactures, commerce, payment of domestic service, etc., and *dépenses du revenu*, or rent, which might be divided between the two other classes of expenditure in various proportions. The productive expenses were so called because they alone were supposed to be annually reproduced with a *produit net, revenu*, or rent in addition, while the sterile, or, as Adam Smith translates it, unproductive expenses, had to be provided for out of the *reproduit total* to which they contributed nothing. Hence came the theory that agriculture and kindred extractive industries alone were productive, and that manufactures, commerce, domestic service, etc. were unproductive, being mere exchanges (see besides the *Tableau* itself; reprinted for the British Economic Association 1894, *Œuvres de Quesnay*, ed. Oncken, pp. 537, 538).

Adam Smith, for the reasons which he gives in *Wealth of Nations*, bk. ii. ch. iii. and bk. iv. ch. ix., saw the fallacy of this view so far as regards the labour of "artificers, manufacturers, and merchants," but not as regards menial service and other labour which does not "fix or realise itself in any particular subject or vendible commodity." Consequently in the *Wealth of Nations* the "annual produce of the land and labour of the society" which constitutes its real wealth (Introd. and Plan, *ad fin.*), formally at any rate, consists only of "particular subjects or vendible commodities," and does not include any of the comforts and enjoyments of the community which are created by labour directly and not through the medium of such objects. The produce is therefore not equivalent to the sum of the incomes of the

individuals constituting the society, since every individual's income, reckoned by any known method, includes satisfactions created by the labour described as unproductive.

This doctrine of Adam Smith never obtained much hold on the continent of Europe. His translator GARNIER rejected it (note xx.). His faithful disciple and populariser, J. B. SAY, got rid of it by the simple expedient of dividing produce into material products and immaterial products, according as it is created by Adam Smith's productive or by his unproductive labour (*Traité*, liv. i. ch. xiii.). In England MALTHUS, though rather half-heartedly, adopted Smith's view (*Political Economy*, p. 28). James MILL seems to have accepted it without question (*Commerce Defended*, p. 69). J. S. MILL enthusiastically supported it with all possible arguments in his youthful *Essay on the words productive and unproductive*, the substance of which was afterwards incorporated in his *Principles*, bk. i. ch. iii., and his popularisers have followed him (e.g. FAWCETT, *Manual*, bk. i. ch. iii., Symes, *Political Economy*, pp. 25, 26). But even here the weight of authority has always been overwhelmingly on the other side. The author of the article "Political Economy" in the 4th ed. of the *Encyclopædia Britannica*, though himself "rather disposed to adhere to the doctrine of Smith," admitted that "the most eminent writers" of the time disagreed with him. M'CULLOCH showed the fallacy of the doctrine in an effective passage of his *Principles*, pp. 406, 407. T. CHALMERS considered it not only unsound from a scientific point of view, but practically pernicious (*Political Economy*, ch. xi. *ad init.*). SENIOR criticised it with destructive effect, showing that whether we regard labour as performing a service or producing a commodity is a question decided by the most trivial considerations (*Political Economy*, 8vo ed., pp. 51-53). Prof. Marshall, though he thinks that it is probably better that the distinction between productive and unproductive "should dwindle gradually out of use rather than be suddenly discarded" (*Principles*, 3rd ed. bk. ii. ch. iii. § 2, note), makes no use of the modification of J. S. Mill's doctrine which he proposes, and substitutes "social income" or "national dividend" for the "annual produce" of the older writers. In the national income he includes the creation of "unproductive" as well as of "productive" labour (*ib.* ch. iv. § 13).

[Most of the passages referred to will be found collected together in Cannan, *Hist. of the Theories of Production and Distribution*, 1893, ch. i. § 7. LOCKE generally speaks of the "products of land" in a way which cannot be regarded as technical; but in one place (*Considerations*, 2nd ed. 1696, p. 121) he places the producer in antithesis to the consumer in a manner very suggestive of modern usage.]

E. C.

PRODUCE CLEARING. There can be no doubt that the application of the bankers' clearing system to the settlement of transactions in produce is largely, if not entirely, a consequence of the abnormal fluctuations in exchange, and the great decline of prices characteristic of the period since 1873. It has been an attendant condition of the development of transactions in "futures" and "options" (see FUTURES and OPTIONS). This system of dealing is an extension of methods long characteristic of operations on the stock exchange. Speculation in produce, analogous to speculation in securities, is of course at least as ancient as the time of Joseph; its fundamental economic utility has always been the averaging of the supplies of good crop years with the supplies of lean crop years, a comparative steadiness of prices and the prevention of scarcity or famine being the consequences. Under the relatively stable monetary conditions preceding 1873, such speculation was rather due to the foresight and statistical studies of individuals, than characteristic of any trade as a whole. Speculative operations in commodities were financed by the great capitalists who conceived them, or by credit based on their wealth, and they were, so to speak, quite occasional operations. But in recent years the system of buying for distant requirements, instead of being merely a method of taking advantage of present abundance and consequent relative cheapness, with the hope of profit during a period of scarcity and relative dearth, has become mainly a system of "hedging," to use a term of the turf, against quite incalculable changes in prices no longer governed mainly, if at all, by the relation of supply and demand. The increasing separation of the capitalist from the ENTREPRENEUR, or employer of labour, itself a consequence of the increasing uncertainties of trade, has also made it more and more necessary for the latter to adopt the safeguards of the "book-maker" on the race-course. Trade has become subject to influences as remote from the essential conditions and factors of the particular branch of industry and commerce undertaken by the producer or distributor, as explosions, fire, or pestilence; and these new contingencies have not the comparative rarity which makes even such catastrophes as those mentioned more or less calculable factors. Even explosions or shipwrecks, occurring at long if uncertain intervals, may be provided against by a guarantee or insurance fund. But the daily or even hourly fluctuations of exchange defy forecast. The possible loss by explosion or shipwreck is a known quantity; but under the new conditions the possible range of an exchange fluctuation, and therefore the possible loss, are incalculable. Hence the owner of accumulated capital has become less and less

disposed to risk its loss in industry or trade, and more and more disposed to prefer the safer, if possibly less princely, income of the *rentier* and the mortgagee to that of the producer or merchant. The fall of prices, by increasing the purchasing power of fixed incomes, or the capital value of bonds, has encouraged this tendency. Thus the business of the producer, and to a large extent of the distributor, has tended to pass into the hands of men whose chances of success, from the exercise of their personal abilities as employers of labour, have exceeded their risk of loss from the disappearance of the mere margin of capital, as compared with the whole capital, invested by them in their undertakings. Such men have manifestly less staying power than the great capitalist employers of former days, and, therefore, they are the more constrained to minimise risks by *per contra* purchases or sales of "futures" or "options." The narrowness of profits in the great manufacturing industries, again, has in many instances encouraged the extension of such operations beyond the requirements of the particular business carried on, in the hope of snatching profits by re-sales, so that the manufacturer has become a speculative dealer in raw materials as well as a consumer of such materials, and seller of finished fabrics. The incessant fluctuations of the rates of exchange, and the consequent almost daily variation in the price relations of the various stages of the industry, have made "hedging" operations an almost daily necessity, the same individual both buying and selling "futures" on the same day in order to guard against any eventuality. For all these reasons the number of transactions, the overwhelming majority being merely book entries which ultimately cancel each other, has been enormously increased, the volume of figures being vastly beyond the sum representing the value of the produce actually transferred in the end. This huge multiplicity of transactions has necessitated the establishment of produce clearing-houses for minimising the accountancy labour and payments involved; otherwise the practicable limits of such operations would have been reached long before their present magnitude had been attained, and further expansion would have been checked.

In this country the development of the system seems to have been mainly restricted to Liverpool and London. There is no produce clearing-house in Glasgow, for instance. Glasgow, in regard to wheat and sugar, is mainly what is called "a consumer's market," and such speculative business as is done in those commodities is conducted through Liverpool or London. The "warrant" system in the Glasgow iron trade, though developed largely as a means of economy in handling and warehousing pig-iron, does, however, present points of resemblance to the produce clearing system. It affords the producer a means of financing; it enables the user of pig-iron, as a material, to cover his future requirements and to "hedge" against variations in prices; and it facilitates speculation, pure and simple, in the material. The brokers or their representatives

meet every day to "adjust differences" with each other, though payments are not made through a clearing-house, but directly between the brokers. In the Liverpool corn trade the produce clearing system is more fully developed, and an important function of such organisations, that of fixing what may be regarded as market prices, comes into observation. Every contract is registered and numbered by the Corn Trade Association, and each day at specified times, 10.30 A.M., 2.15 P.M., and 4.15 P.M., prices are officially declared by call from a rostrum. The call at 2.15 is taken as the "striking price" for settlement. Settlements are effected through a clearing agency which notifies buyers and sellers each morning of the "difference" to be received or paid on each contract. In this case the system unquestionably seems to present a more purely speculative aspect than in some other cases, and in regard to wheat, more than any other commodity, it has been urged that the influence of the system is injurious to the producer as tending to depress prices irrespective of natural conditions. This view has been definitely adopted by the agrarian party on the Continent, and has already resulted in repressive legislation. It seems probable, however, that, as for every "bear" seller there must be a buyer, who is relatively a "bull," the "differences" will in the long run be earned by that one of the two who most accurately forecasts the actual conditions of demand and supply; and, therefore, that the permanent tendency is to fulfil the legitimate function of speculation, the equalisation of prices and supply in spite of crop variations. The fact that for a considerable period prices have tended downward, which fact forms the basis of the agrarian complaint against dealings in "futures," may be explained as due to some other decisive influence. In other words, "bear" operations have invariably been most successful, not because they have caused prices to fall, but because they have been in harmony with the operation of some dominant depressing cause. Though there is some speculation in sugar in Liverpool, the "ringing out" or "set-off" system appears to be very slightly developed there in regard to this commodity. Contracts are mainly with the local sugar refiners, and are directly settled on maturity; there is no clearing-house. It is in the cotton trade that the system has attained its greatest development, and where its justification by economic conditions is perhaps most apparent (see CLEARING SYSTEM; COTTON CLEARING). The position of the cotton manufacturer is indeed in many respects exceptional. The large amount of capital invested in a mill equipped to the high degree of efficiency which has become absolutely essential to the existence of the industry under the conditions of extreme competition and almost theoretically perfect organisation which have been developed, and the extreme delicacy of the machinery, make it impossible for the cotton-mill owner to stop production without ruinous loss. Irrespective of the loss of interest on borrowed capital now very largely employed in the cotton industry, the position of the mill-owner is analogous to that of the carrier by horse-traction. The latter must keep his animals fed whether there is any remunerative work for them to do or not, or they will die; and the former must keep his machinery running or it will rust and speedily become valueless. There would be as ruinous a loss of capital if the machinery were not "fed" with cotton, in the one case, as there would be if the draught horses were not fed with corn in the other. Partly owing to this condition, and partly to the great magnitude of the trade, the number and variety of the markets—each with its special seasonal variations—supplied throughout the world, and their great distances in many instances, there is no industry so liable to occasional and even prolonged divergence of the prices of the raw material and of the finished or partly finished productions from what may be described as a parallel course, as the cotton industry. On the one hand, there may be very wide variations in the huge crops of raw material required, owing to climatic conditions, and on the other, there may be equally wide variations in the demand for the enormous supply of yarns and cloths continuously produced, owing to variations in the economic conditions of the many countries and dependencies supplied. Then, again, owing to the necessity of keeping up steady supplies of well-known goods in particular great markets, or large seasonal supplies which require time for production and for carriage long distances, a system of mercantile contract-

ing for deliveries of goods for many months ahead has come into vogue. For all these reasons there is no industry or trade so much at the mercy of fluctuations in the monetary exchanges. Thus, it will be seen that the cotton spinner or manufacturer has, in the first place, to cover his future requirements of cotton merely to feed his machinery; in the second place, he has to cover his contracts for the future delivery of yarns or goods of particular kinds requiring different descriptions of cotton; and he has also to secure the particular kind of cotton needed for the occasional day-to-day orders he may obtain. Finally, he must as far as possible safeguard himself against quite abnormal variations in the selling prices of any stocks he may have accumulated brought about by entirely erratic variations in the monetary exchanges. The system of dealing in "futures" enables him, at least to some extent, to meet these necessities of his business. Not only can he take the favourable opportunity for securing an adequate supply of a staple description of material in advance, but by repeated purchases and sales of "futures" as the months pass by he may "hedge" against price variations, and at the same time vary the particular descriptions of cotton originally contracted for in accordance with variations in the details of the particular orders for yarns or goods he receives. Thus the organisation for dealings in "futures" not only enables the spinner or manufacturer to provide in advance for a still unknown variety of requirements, but saves innumerable transfers of cotton from warehouse to warehouse, or mill to mill; while the arrangements for clearing "differences" by setting one against the other saves innumerable payments. It may be mentioned that the "striking" prices are fixed by a committee every Monday at 11 A.M., the organisation thus acting as a kind of fly-wheel in regulating the movements of the market.

The influence of the abnormal conditions affecting prices which were unknown before 1873, and which have induced the enormous development of "futures" dealings in the cotton trade and the establishment of a special cotton "clearing" organisation, is clearly traceable in the establishment of the London produce clearing-house in 1888, and the expansion of its business. The fact that the primary object of the last-named institution is declared to be the guaranteeing the fulfilment of contracts for future delivery to both buyer and seller, in itself suggests that the organisation had its origin in a recognition of the necessity for some system of insurance against the new and extreme uncertainties introduced into business by the violent fluctuations of the exchanges. Contracts in this case are only accepted from brokers authorised by the produce clearing-house, and in consideration of the guarantee the brokers undertake to do their "forward" business exclusively through that institution. Deposit margins have to be maintained in the possession of the clearing-house, but settlements may be and frequently are arranged directly between the buyer and seller of the contract, and every contract is ultimately closed by the delivery of actual produce. Brokers who desire to join the organisation must be proposed and seconded by members and on admission pay an annual subscription, and official quotations are fixed every working day by elected committees, representing respectively the dealers in each commodity. The dealings now embrace coffee, sugar, wheat, maize, tea, and silk, the produce most affected by the fluctuations of the monetary exchanges. The addition of dealings in silver is especially significant. It cannot for a moment be supposed that the business of the silver-smith makes "future" dealings in the raw material of the industry a necessity in the sense in which dealings in cotton "futures" have become a necessity. Variations in the price of a precious metal do not affect the prices of the finished manufactures either as promptly or to anything like the same extent as variations in the prices of the raw materials of the great wholesale or "massen," to borrow an expressive German term, industries; nor is the silversmith called upon to provide for the continual employment of a large plant for long periods ahead. The circumstances of his industry permit him to adopt what is known as the "hand-to-mouth" policy in buying his materials—that is, to restrict his purchases more or less closely to his immediate requirements; and any speculation in which he may indulge is rather a question of securing an extra profit than a question of "hedging." The seasonal character of the production of food-stuffs such as coffee, sugar, and grain, puts the distributor of those products in a

position in some respects analogous to that of the great mill-owner in regard to providing for future requirements. The farmer or planter must dispose of his crop as rapidly as possible after the harvest, partly because it must be collected in the great centres of distribution if it is to be distributed at all, for the individual consumer cannot be brought, except to a very limited extent, into direct relations with the individual producer, and partly to put himself in funds for the production of the next crop. On the other hand, the wholesale distributor must, broadly speaking, at the particular time when the crop comes into the market, secure supplies to meet a demand spread over the whole period between crop and crop. He also must endeavour to assure himself against ruinous fluctuations in prices which experience has taught him may occur from causes which are outside mere statistical considerations. Experience has shown further that there is a certain correspondence between the rise or fall of the gold price of silver and the rise or fall of the gold prices of produce. Hence a buyer of produce "futures" may "hedge" by selling silver "futures"; or the banks which guarantee exchange may also to some extent cover themselves by operations in silver. This is not the place to enter into a detailed analysis of such operations. The fact that, notwithstanding the closing of the Indian and Japan mints to the coinage of silver, dealings in silver "futures" continue, is a proof that silver bullion is still very largely used for the settlement of international balances and the adjustment of international exchanges—in short that, though without coinage, it continues to fulfil a true monetary function.

To sum up, produce clearing-houses are the visible and necessary machinery for the system of dealing in "futures" and "options" as applied to merchandise, the tendency of which is to give a certain average steadiness to prices for limited periods and to provide a means of mutual assurance against incalculable risks, such insurance being based on the "hedging" or compensation-balance principle. The system is imperfect and costly from the strictly economic point of view, and it unquestionably gives rise to very grave abuses. But it seems probable that, had it not been for its evolution from the necessities of the case, the abnormal variations of the monetary exchanges through the break-up of the international monetary system existing before the closing of the French mint against silver, would have made the continuance of international trade, and the existence of certain great industries which are dependent on such trade, practically impossible.

F. J. F.

**PRODUCERS' GOODS**, called also Production Goods, Instrumental Goods or Intermediate Goods, are those which satisfy wants *indirectly* by contributing towards the production of other goods. The term is used in opposition to **CONSUMERS' GOODS**, or consumption goods, or goods of the first order, which satisfy wants *directly*. The distinction was first given by J. B. SAY (*Cours de l'Économie Politique*, pt. i. ch. xii.); it has been developed by Hermann, and still further by C. Menger (*Volkswirtschaftslehre*, ch. i. § 2), who distinguished goods of the 2nd, 3rd, and higher orders. But even the original distinction which Say made is not always easy to apply; and the line of division is drawn in different places by different writers. On the whole, it seems best to include in "production goods" any form of wealth which can only be utilised through a further expenditure of economic labour. Thus it includes (1) all raw and unfinished materials, even those otherwise *finished* goods which are in the hands of dealers and are only utilised through the labour of shop-attendants and conveyers; (2) implements and buildings used in any form of indus-

try. If personal goods—personal qualities—are not explicitly excluded, production goods would also include all those individual or social qualities, habits, and relations which conduce to industrial efficiency. The distinction between production and consumption goods has a very important bearing on questions regarding the scope of the term CAPITAL (*q.v.*), and on methods of estimating the wealth of a nation.

[Marshall, *Principles of Economics*, vol. i. 3rd ed., pp. 133, 134.—Sidgwick, *Principles of Political Economy*, bk. i. chs. iii. v. See also articles on GOODS, CLASSIFICATION OF.] W. E. J.

**PRODUCERS' RENT.** The controversies that have arisen in regard to the relation between COST OF PRODUCTION and the RENT OF LAND used in production have led to the view that the remuneration of *any* agent of production whatever often contains, temporarily or permanently, an element similar to the RENT of land. To this element the name "producer's rent" or "producer's surplus" has been given. Producer's rent is regarded as a surplus remuneration accruing to any agent of production which is in excess of the amount sufficient to call forth the supply of that agent. The conception of producer's rent plays an important part in the modern theory of DISTRIBUTION; but writers are by no means agreed as to its precise nature. It has been elaborately examined by Professor Marshall, who has pointed out certain analogies between the relation of producer's rent to supply-price on the one hand, and that of CONSUMERS' RENT to demand-price on the other hand. The same writer has further distinguished between rent and quasi-rent. The most important application of the doctrine of producer's rent arises in the theory of the incidence of TAXATION. If a tax, levied over a certain area of taxable commodities and for a certain period of time, lowers the remuneration of any of the agents of production, without raising the price of the commodities, then it may be said that, within that area and for that period, the remuneration of those agents is of the nature of producer's rent. Or conversely, if any remuneration can be shown, as limited above, to be a producer's rent, a tax, similarly limited, will fall upon the rent owner.

[All modern discussions of the Theory of Distribution include references to Producer's Rent.]

### PRODUCTION.

Production, p. 213; Production and Consumption, p. 213; Production, Cost of, p. 216; Production, Instruments of, p. 216; Productive (the terms), p. 216; Productive and Unproductive Labour, p. 217; Productivity of Capital, p. 220.

**PRODUCTION** (or, in full, **THE PRODUCTION OF WEALTH**), as the title of one of the great departments into which economic treatises divide political economy, seems to have appeared first in the *Traité* of J. B. SAY (*q.v.*), which consists of three books on production, distribu-

tion, and consumption respectively. In using the title, J. B. Say was probably influenced by the heading of book i. of the *Wealth of Nations*, in which the productive powers of labour and the distribution of its produce are mentioned. James Mill, in 1821, adopted Say's division of the subject (with the addition of "Interchange") in his *Elements*, and in the same year Col. R. TORRENS wrote his *Essay on the Production of Wealth*. Since that time the use of the title has been almost universal.

Say's book on production begins by describing the process of production, then deals with circumstances favourable or unfavourable to production, such as the institution of property, commerce, state-interference, and colonisation, and finally treats of "a particular product which plays a great part in the formation and circulation of wealth—namely, money." Torrens's *Essay* on the subject is equally comprehensive, and the same may be said of part ii. in M'CULLOCH's *Principles*, 1825. But James MILL, by his plan, not followed by M'Culloch, of giving a separate place to interchange or exchange, and putting it after distribution, deprived himself of the power of describing under production the means by which the production of wealth is actually carried on, and consequently, even in the second and later editions of his *Elements*, and still more in the first edition, the chapter on production is small and fragmentary. English writers subsequent to James Mill and M'Culloch have generally been inclined to follow James Mill's example by keeping a consideration of exchange out of their treatment of production, which has often reduced itself to a collection of observations about the three requisites or agents of production—labour, land, and capital.

[Cannan, *Hist. of Theories of Production and Distribution*, chs. ii.-v.] E. C.

**PRODUCTION AND CONSUMPTION.** Wealth, as the term is used in political economy, denotes all those useful goods that are so limited in quantity as to possess value. By the production of wealth is meant the creation of the useful qualities, *i.e.* the utilities of such goods. It is easy to distinguish two requisites of wealth production: (1) the materials provided by nature; (2) human exertion, indispensable in the production of all wealth except the crudest. It is possible to conceive a limited supply of useful commodities due entirely to the bounty of nature, and therefore produced without human exertion. They would constitute wealth. But for ordinary purposes some degree of human exertion may be considered requisite. The term "land" is used by economists instead of the more general term "materials," for the reason that under existing legal institutions it is only through land-ownership or rental that possession can be obtained of natural materials or access gained

to natural forces. The function of land in production is to furnish standing-room for the productive processes, and to furnish as materials for production all those objects for which science can discover any useful application, but which do not owe their present form, position, or qualities to human exertion. Land, as a requisite for production, thus includes building sites, natural soils, beds of minerals, atmosphere, water-courses, and all the other natural products that together constitute, or are in contact with, the crust of the earth.

New discoveries constantly point to new uses for objects which had been comparatively worthless, and increased population constantly makes new demands on the surface of the earth for mere habitation. As a consequence the absolute importance of this primary requisite of wealth production increases with the growth of population and social progress. But the relative importance of land as a productive agent tends to decrease. So long as we recognise only the two factors, land and human exertion, it is evident that the changes which bring about an increased quantity of wealth in a country which has once been fully occupied are due chiefly to the modifications in the forms of human exertion. In primitive stages of civilisation human welfare depends almost exclusively on the extent to which nature provides objects suitable for the supply of man's wants. But the expression "human exertion" is a complex term which must be resolved into simpler elements. Under the primitive conditions to which reference has just been made, it is virtually equivalent to muscular labour. This labour force, directed either instinctively or by the low degree of intelligence necessary, is expended directly upon objects desired for consumption. When fruit, fish, or game is abundant, it produces much wealth. When they are scarce, great labour is necessary to produce sufficient wealth for the bare support of life.

In the course of industrial progress two features of human exertion are gradually developed, which render such exertion, considered as a whole, a much more complex factor in the production of wealth and greatly to augment its importance. The first of these is the rise of CAPITAL. The second is the change in the forms of industry due to enterprise. "Capital" is a term used to designate the results of all industry except those final acts in the series of productive processes which transform an unfinished into a finished product. Under primitive conditions nearly all labour is engaged in the production of PRESENT GOODS, *i.e.* commodities fitted for immediate consumption. In later stages only a relatively small proportion of the available labour is so utilised. Much of it is engaged in the production of commodities which do not directly satisfy

human wants, but will be useful in further production. In a certain sense they are unfinished or future goods. A plough, a reaper, a flour mill, an oven, are all so, in one sense, equivalent to many loaves of partly-made bread. These capital goods are useful only in view of the goods for the ultimate production of which they are themselves brought into existence. In the modern industrial world the relative quantities of these capital or FUTURE GOODS is much greater than in earlier stages of industry. They indicate that human exertion is now more efficiently expended. The productive series cover a longer period and imply the expenditure of much labour long in advance of the enjoyment of its results. This does not involve at any point an absolute diminution in the quantity of present goods. On the contrary, since the growth of capital is gradual, there is naturally both an ultimate and a contemporaneous increase of goods fit for immediate consumption. Human exertion and land, the primary productive agents, are now increasingly efficient because, through the use of capital, a given amount of labour will produce more wealth from the same materials. Capital thus comes to be considered a third requisite of production. While goods classed as capital are like other commodities, produced by human exertion upon natural materials, they differ from commodities fit to supply human wants directly, in that their sole function is to aid further production.

Earlier economists usually thought of capital as a fund saved by the exercise of personal abstinence from consumption, and used chiefly to support the labourers during the period in which they are engaged in any particular production. The more recent tendency is to view capital, not as a fund saved from consumption, but as a natural development of the productive process. Capital appears, not because consumers have denied themselves pleasures which they might have enjoyed, but because producers have begun to exert their energies in a more efficient manner. The capital goods are increasingly prominent in highly-developed industrial society only because its production is increasingly complex and indirect, each series increasingly extended and interwoven with other series. Capital is a result of saving; but the saving of which it is a result is not mere non-consumption, but rather a positive modification of the method of production which, by permitting longer periods, greater specialisation, and more serial methods, increase both capital and the product.

Long before industry has reached the highly-complex form with which we are familiar, enterprise or directive intelligence has become an element in the production of wealth which cannot rightly be ignored, or unceremoniously dismissed as a new DIVISION OF LABOUR. The

intelligence which directs the application of labour to land and capital, has now become a factor of prime importance. There is discernible in nearly all recent economic literature a tacit recognition of this fourth factor, though there is no general agreement in the use of a term for its designation (see *ENTREPRENEUR*). It is discussed sometimes under Industrial Organisation, sometimes under Management, and again, as a special variety of Labour. Directive intelligence and labour force, however necessary each is to the other in actual industry, are clearly distinguishable. They are united in various persons in quite different degrees. That they cannot be physically divorced is no more reason for not enumerating them separately, than the impossibility of exerting labour without materials is a reason for identifying those agencies. If a higher degree of intelligence directs industry at one time than at another, the result is an increase in total productive power, precisely as in the case of more abundant materials, more effective labour, or increased capital. Efficient wealth production in the present industrial régime depends indeed more on management than on any other single factor. Each of the other agencies remains essential, but intelligence in production becomes the variable factor which in recent times distinguishes the successful communities from those which, with equal opportunities, produce less wealth.

In actual industry we see these four agencies only in combination. The organisation of industry begins with its earliest forms, and becomes steadily more complex as society develops new wants and increases its productive power. The most prominent features of this more complex organisation are (1) an extension of the division of labour; (2) an increased localisation of industry or territorial division of labour; (3) an increased utilisation of different types of labourers for different kinds of production, or, as it may be called, a racial division of labour; (4) a tendency toward production on a larger scale; (5) the development of specialised machinery and individual skill.

A survey of production should lead to a clear conception of the sources of productive power. Modifying the enumeration of Mill (*Principles*, vol. i. bk. i. ch. vii.), to bring it more nearly into conformity with the preceding discussion, and reversing its order that the sources may appear in the order of their present importance, we may conclude that the productive power of society will be great when there exist (1) intelligent direction of the natural forces; (2) conditions favourable to a high degree of energy, enterprise, and trustworthiness; (3) serial methods of production, the outward indication of which is the presence of relatively large quantities of capital goods; (4) possession of abundant material resources.

Economic writers will naturally emphasise these various elements, not in accordance with the positive contribution made by each to the total production—which it is impossible to ascertain—but in accordance with their respective notions as to the degree in which any of them, at a given time, may be classed as limiting requisites. In the middle of the century the prevailing view was that capital was the limiting requisite. Mill's famous proposition that industry is limited by capital is the clearest expression of an idea, which is, however, also involved in the entire *WAGES-FUND* theory. The so-called *SINGLE TAX* movement is based on the idea that, under existing social arrangements, land is the limiting requisite. The theory of distribution, which makes of wages the "residual share," and of labourers the class that are in position to reap the benefit of industrial progress, implies that labour is the limiting requisite. Each of these assumptions may be true of a particular stage of industrial development, while it is probably true that at present production is limited by the slow increase of intelligent management rather than by a deficiency of land, labour, or capital. The laws governing the rate of increase of the productive agencies are of interest in the study both of production and of distribution.

The consumption of wealth properly forms, according to many recent economists, a distinct division of political economy, though in the standard texts consumption has usually been discussed only with reference to its effects on production. The economist is called upon to show that productive efficiency is increased by economical consumption, e.g. by the avoidance of waste, and in general by a judicious expenditure of income. It may also be pointed out that increased variety of consumption in society directly increases social wealth by calling on new resources in nature. The possibility of making the best use of land depends quite as much on the character of social wants as on the amount of scientific knowledge. Changes in human wants accompany changes in human activities, and are often their cause. The improvement of consumption is, as a rule, the initial step in social progress. Political economy finds its centre of interest in the home rather than in the factory, for the reason that the efficiency of society's production finds there its ultimate test. There is the most wealth only in that place where there is the greatest human weal. If wealth be not economically consumed, the labour expended in its production is in so far wasted. Production is the creation of utilities. Consumption is usually accompanied by their destruction, but in such a manner that the intended satisfaction is actually realised. In this last condition lies the distinction between consumption and waste.

[See CONSUMPTION AND CONSUMERS' GOODS. Jevons pointed out (*Theory of Political Economy*, p. 43) that the theory of economics must begin with a correct theory of consumption. Professor Marshall, in his *Principles of Economics*, has recognised the correctness of this view by placing the book on "Demand or Consumption" before that on "Production or Supply." Professor Patten in *The Theory of Consumption, The Theory of Dynamic Economics*, and elsewhere, has outlined the contents of a Theory of Consumption, which is practically independent of Production, Exchange, and Distribution, thus meeting the objection of Keynes (*Scope and Method of Political Economy*, 1st ed., note to ch. iii.), that the discussion of the various topics treated under Consumption may be distributed among the other divisions of political economy. The view urged by Keynes is that "a true theory of consumption is the keystone of political economy," but that "it may, nevertheless, be regarded as occupying the position of a fundamental datum or premiss of the science rather than as constituting in itself an economic law or laws on a par with the laws of production, distribution, and exchange." This statement and the article on CONSUMPTION reflect the usual treatment of the subject in standard English and American text-books.] E. T. D.

PRODUCTION, COST OF. See COST OF PRODUCTION.

PRODUCTION, INSTRUMENTS OF. A term applied to goods and agencies which have not of themselves any capacity for satisfying the desires of men, but which are requisite or advantageous to them in obtaining or making goods from which enjoyment can be derived. To the cotton manufacturer, his factory is on a different footing from his private residence; a waggon-horse serves a purpose, but not the same kind of purpose as a hunter. Of course, in many cases it is difficult to say to which class a given commodity belongs; indeed, the same commodity may be used for the one purpose at one time, and for the other at another, or for both at the same time, e.g. a ship conveying corn in the hold, and a pleasure-party in the cabins.

Nevertheless, the distinction is real, and great masses of agencies can be placed on each side of the line drawn by it. Accordingly, we have the classification of *Goods of the First Order*, for consumption; of the *Second Order*, for use as instruments; and we go on to a *Third Order*, for use as instruments in making instruments, and so on to farther refinements. (See GOODS, CLASSIFICATION OF.) It was Say who first gave attention to the distinction, and Hermann, Karl Menger, and the Austrian economists have proceeded to elaborate it.

The importance of the distinction comes out in the treatment of CAPITAL (*q.v.*) as consumption capital and auxiliary capital; in estimating the wealth of a country, when, as Prof. Sidgwick points out (*Principles*, bk. i. ch. iii.), "what is commonly prominent in the thought

of men" is the consumption class of commodities; in comparing standards of value and estimating variations therein; in considering whether patents, goodwill, and some other immaterial properties should be reckoned as part of national wealth or not. But the introduction of a distinction within instruments of production, as to whether they are "purchased" or "unpurchased," i.e. given by nature, or acquired by effort and sacrifice, involves us in so much complication that no effective result is obtained by it. A. C.

#### PRODUCTIVE, THE TERMS.

Productive Capital, p. 216; Expenditure, p. 216; Consumption, p. 216; Services, p. 217; Utility, p. 217.

The sense in which the terms productive and unproductive have been used in economic discussions has undergone considerable changes from time to time. The views of mercantilists (see MERCANTILE SYSTEM; PHYSIOCRATS) in respect to this point were affected by the narrowness or breadth of their conception of wealth. Yet this statement alone will not suffice to account for the controversies which have raged around the proper use of these simple terms. What is really needed is to make the terms precise by explicitly indicating what it is in reference to which labour or other effort or sacrifice is considered productive. In the writings of Adam Smith and many more recent writers that labour is called productive which tends to increase accumulated wealth. Many of the misunderstandings which have occurred would have been avoided had writers expanded their thought into the phrase "productive of material wealth" or into "productive of permanent sources of enjoyment," or made it quite clear that such a conception was by them included in the single word "productive." Tradition has, in fact, associated with this term a special reference to stored-up wealth which prevents it from being employed, as common sense would seem to dictate, so as to apply to any effort which results in utility, so as, in fact, to include all effort except that which fails to attain its object, or in so far as it fails in that end if failure be only partial.

*Productive capital* is therefore capital devoted to producing the means of production and lasting sources of enjoyment, not capital which is itself a source of enjoyment.

*Productive expenditure* is such expenditure as is not devoted to ephemeral enjoyment, but, directly or indirectly, to obtaining increased means of acquiring utility.

*Productive consumption* will include only such consumption of productive workers as is necessary for maintaining their working capacity, but will include the necessary consumption of children or of adults during sickness, as these are devoted to the development or restoration of working capacity.

*Productive services* will include all such as are not in themselves an end, but are a means towards a more remote utility.

*Productive utility.*—If an object or service be capable of ministering to direct enjoyment, and also, either at the same time or alternatively, of assisting in producing either other means of production or some more or less permanent source of enjoyment—if, in fact, it can minister either mediately or immediately to enjoyment, the utility which it has in virtue of its capacity to minister to enjoyment mediately will be called productive utility.

The nature of the distinctions drawn between productive and unproductive services or goods will be best made clear by reference to the following quotations from J. S. Mill's essay on the subject. The artificial nature of some of these distinctions would be thrown into relief if their practical results were examined by applying them to particular cases.

"The following are always productive :—

"Labour and expenditure, of which the direct object or effect is the creation of some material object useful or agreeable to mankind.

"Labour and expenditure of which the direct effect and object are, to endow human or other animated beings with faculties or qualities useful or agreeable to mankind, and possessing exchangeable value.

"Labour and expenditure, which, without having for their direct object the creation of any useful material product or bodily or mental faculty or quality, yet tend indirectly to promote one or other of these ends, and are exerted or incurred solely for that purpose.

"The following are partly productive and partly unproductive, and cannot with propriety be ranged decidedly with either class :

"Labour or expenditure which does indeed create or promote the creation of some useful material product, or bodily or mental faculty or quality, but which is not incurred or exerted for that sole end ; having also for another, and perhaps its principal end, enjoyment, or the promotion of enjoyment.

"The following are wholly unproductive :—

"Labour exerted, and expenditure incurred, directly and exclusively for the purpose of enjoyment, and not calling into existence anything, whether substance or quality, but such as begins and perishes in the enjoyment."

"Labour exerted and expenditure incurred uselessly, or in pure waste, and yielding neither direct enjoyment nor permanent sources of enjoyment."

[J. S. Mill's essay on "the words Productive and Unproductive," in his *Unsettled Questions of Political Economy*, gives one of the most useful discussions of the points involved.—Marshall, in ch. iii. of *Principles of Economics*, bk. ii., explains the senses in which the words are used, and, in a footnote, expresses the view that the distinctions

should be allowed to dwindle gradually out of use rather than be suddenly discarded. Cp. also *Wealth of Nations*, bk. ii. ch. iii. and bk. iv. ch. ix.—Mill's *Principles of Political Economy*, bk. i. ch. iii., and Travers Twiss, *Progress of Political Economy*, § 6.]

A. W. F.

#### PRODUCTIVE AND UNPRODUCTIVE LABOUR.

Productive labour has been generally conceived as labour creative of wealth or profit, or, as M'CULLOCH expresses it, labour which occasions the production of a higher value than was expended on carrying it on, or even of the same value. Its scope is limited to the creation of utilities, since no labour can add to the quantity of matter in the world (J. B. SAY, *Traité d'Économie Politique*, bk. i. ch. i.) : as the derivation of the word implies, production is the *drawing forth* or development of utilities from the existing sum of matter (see PRODUCTION). "Produire, en effet, c'est donner de nouvelles formes à la matière" (Condillac, *Le Commerce et le Gouvernement*, ch. ix.). Our conception of productive labour depends on our antecedent conceptions of WEALTH (*q.v.*) and VALUE (*q.v.*), that is, on our idea of what kinds of utilities constitute wealth (see UTILITY). Thus the MERCANTILE SYSTEM admitted as productive those methods of employing the factors of production which increased the stock of precious metals possessed by a nation, *e.g.* mining and export trade : a classification which stands or falls with the conception of national wealth as consisting in money (ROSCHER, *System der Volkswirtschaft*, bk. i. § 48). The PHYSIOCRATS based their division of productive and unproductive classes on the theory that the earth is the only source of wealth. According to them the labour of proprietors and cultivators of land is productive, as it increases the stock of raw material useful for human ends ; that of manufacturers, artificers, and merchants is unproductive, as it is maintained out of the superfluities of the two productive classes. They held that the value of a manufacture depends on the quality of the raw material, any superiority in value of the finished over the raw product serving only to cover the cost of the worker's maintenance ; while commerce simply moves existing wealth from one place to another. ADAM SMITH (*W. of N.*, bk. iv. ch. ix.) pointed out that, even if the merchant and artisan only replaced the value of what they consumed, they could not accurately be called unproductive ; but in fact their efforts increase the total revenue of a society, since in estimating it the amount of value they produce must be added to the total amount of value produced by the agricultural labourer for his own and their consumption. It has further been observed that many labourers undoubtedly add more value to their material than they consume : for instance, a sculptor and a stonemason produce widely different values in similar

blocks of marble; and some of the physiocrats admitted, on this account, the productivity of manufactures. But commerce also increases the value of material by transporting it not merely from one place to another, but from a place where it is in less to a place where it is in greater demand (see COMMERCE): as CONDILLAC shows, in an economic exchange both parties gain (*Le Commerce et le Gouvernement*, ch. vi.). The view of commerce as a "parasite industry," adopted by FOURIER (*Theory of Social Organisation*, New York, 1876, pp. 94-110) and socialists of his school, is based on a criticism of its abuses, not on a demonstration of its essential unproductivity.

Adam Smith observes further that, even supposing wealth to consist only in the raw produce of the earth, yet manufactures and commerce are often instrumental in importing more of this into a country than its own resources could produce. He thus expressly admits the principle of indirect production; but his own classification (*W. of N.*, bk. ii. ch. iii.) includes as productive the agricultural, manufacturing, and mercantile classes, because their labour tends to "fix or realise itself in some permanent subject or vendible commodity," and excludes the labour of officers of war and justice, clergy, lawyers, physicians, domestic servants, actors—in short, personal services. M'CULLOCH, on this passage, remarks that this division is inconsistent with Smith's admission elsewhere that wealth includes other than material and vendible products; but in any case it is the services of Smith's unproductive classes that enable his productive classes to produce. A soldier or a servant, by relieving the direct producer of work which he would otherwise have to do for himself, leaves him time to produce proportionally more; thus according to Smith's own theory of the DIVISION OF LABOUR (*q.v.*) these personal services should be considered at least indirectly productive. Smith's inconsistency is in neglecting to include here, as he does elsewhere, the principle of indirect production; his restriction of the scope of productive labour to a single kind of wealth is not necessarily inconsistent, but as J. B. SAY noticed (*Traité*, bk. i. ch. xiii.) it is arbitrary. To Say belongs the credit of demonstrating that since we can neither create nor annihilate matter, but only develop utilities in or apart from matter, there is no scientific objection to our applying the term "productive labour" to the creation of immaterial as well as of material products. Unfortunately neither Say nor M'Culloch sufficiently emphasises the truth that material and immaterial products alike can be considered wealth in virtue not of their utility—which Smith did not deny to immaterial products—but of their exchangeable value. They are apt to neglect the distinction so carefully maintained by the physiocrats,

between *biens* and *richesses*. J. S. MILL therefore (*Principles of Pol. Econ.*, bk. i. ch. iii.), observing with justice that the production of utility does not satisfy the notion which mankind have usually formed of productive labour, whose end he conceives to be not utility but wealth, and that the word "unproductive" conveys no stigma unless production be regarded as the sole end of human existence, revives and expands Smith's definition. He remarks that the popular idea limits wealth to the possession of utilities fixed in material objects, not because they are material, but because they are capable of accumulation. Labour, therefore, which produces utilities fixed and embodied in material objects, he calls productive, and he shows that this definition includes commerce. Labour which produces utilities fixed and embodied in human beings, such as the labour of teachers and physicians, he regards as indirectly productive if an increase of material products is its ultimate result; but in Mill's *Essays on some Unsettled Questions of Pol. Econ.* he gives quite a different reason for regarding it as productive, namely that utilities embodied in human beings are permanent and may therefore be considered wealth. Labour not fixed nor embodied in anything, but consisting in a mere service rendered, he calls unproductive.

But first, it is hardly possible to draw a line between material and immaterial products. A statue or picture is a material product, but its value is mainly as immaterial as that residing in the performance of an actor. Secondly, almost every occupation, however frivolous, could be imagined to contribute to mental or bodily health and hence, indirectly, to the increased productivity of the productive labourer. Thirdly, Mill grants that unproductive labour is often productive for an individual or a nation, if not for the world at large. A mercenary soldier or a travelling actor labours productively from his own point of view if his gains repay his exertions; and if he returns home his gains increase the sum of his own nation's wealth. Fourthly, utilities embodied in material objects are not always wealth: a commodity unsaleable because produced in a quantity exceeding the demand for it is not wealth, therefore the labour spent on producing the excess was unproductive, as Mill in the *Essays* admits. Thus the definition in the *Principles* covers some cases where labour is not productive, but not all cases where it is. Mill urges the advisability of accommodating economic definitions to popular conceptions. A scientific definition should express not the popular conception but its philosophic basis, but apart from this, the conceptions of wealth and consequently of productive labour have varied so widely that popular usage cannot well be quoted in sanction of any one of them

In the *Essays*, Mill prefers to define productive labour as the creation, directly or indirectly, of permanent sources of utility or enjoyment possessing exchangeable value. But the assumption that permanence is necessary to the idea of wealth violates the law of continuity. "Things are of all degrees of permanence, from the land which lasts for ever down to labour which perishes in the using" (Macleod, *Elements of Economics*, vol. i. p. 85). Mill does not indicate at what length of duration he draws the line. The one characteristic common to all kinds of productive labour is the exchangeability of their products; and immaterial products are as exchangeable as material ones. ROSCHER's classification of productive labour as "all labour which is in reasonable demand and adequately paid," is in harmony with the conception established by the ancients and accepted by the physiocrats and Adam Smith, that the principle of wealth resides in exchangeability. F. A. WALKER (*The Wages Question*, London, 1891, pt. i. ch. i.) proves only that all wealth is not exchanged, not that it is not all in principle exchangeable.

Whatever may be the defects of Mill's classification, he perceives that a scientific definition of productive labour does not necessarily enable us to determine whether any particular piece of work is productive or not. Still less can we distinguish between productive and unproductive classes: as SENIOR says, most men belong to both. Again, the distinction of direct and indirect productivity can be maintained only in relation to a given kind of labour: for instance, a judge, by securing the payment of a shoemaker, contributes indirectly to the fabrication of shoes, while the shoemaker, by supplying the judge with shoes, contributes indirectly to the maintenance of justice. Productive and unproductive labours differ not in kind but in degree. To the community all labours are unproductive which are maintained to the disadvantage of others which are more necessary, as when the military, clerical, or professional classes increase out of proportion to the agricultural and manufacturing classes. Not the profession as such, but the excess of the numbers engaged in it is unproductive; agricultural or manufacturing labour would be equally so, if more of it were employed than was necessary to attain the desired result. Since all production involves antecedent consumption or destruction, it is necessary to the idea of productive labour that the value it creates should not be less than the value it destroys. Senior, indeed, prefers to distinguish between productive and unproductive consumers (*Pol. Econ.*, London, 1872, pp. 53-57), a distinction which has its advantages, since, as Mill observes, all members of the community are not labourers, but all are consumers. But in neither case is it possible to draw a hard

and fast line between productive and unproductive.

Productive labour, then, is best defined as labour which creates or develops, directly or indirectly, material or immaterial products, exchangeable, and possessing a value not less than the value consumed in producing them. These products may be of every degree of necessity, from daily bread to Mill's "pine-apples and gold lace"; and of every degree of durability, from a newspaper to the *κρῖνα ἐς δελ* of Thucydides. HERMANN (*Staatswirtschaftliche Untersuchungen*, 2nd ed., 1870, p. 20) distinguishes further between various extents of productivity. To the producer a labour is productive if he makes a profit by it; to the consumer, if its value to him exceeds the value he expends in securing it; to the community, if it increases the sum of exchangeable goods. But some labours are profitable to individuals though not to the community, e.g. games of chance, as a rule, since by labour which deprives one person of as much as, or more than, it brings in to the other, the common stock of wealth is not increased. On the other hand, some labours may be unprofitable to the producer, and yet contribute to the general wealth more than he expended, e.g. scientific experiments. Roscher observes that private economy measures the productivity of labour by the exchange value of its product, general economy by its value in use, while national economy holds an intermediate position. But from whatever point of view the question be regarded, most recent economists agree in admitting the creation of immaterial products to the rank of productive labour. The higher the ground we take, the harder it is to estimate the productivity of any given labour: the most we can say is, with Roscher, that the greater, freer, and more intelligent a nation is, the more will the gain of the individual tend to become identical with the gain of the nation and of the world.

[See also EFFICIENCY OF LABOUR; EXCHANGE; LABOUR; PROFIT. The development of the theory of productivity is best described by Roscher, *System der Volkswirtschaft*, Stuttgart, 1880, vol. i. bk. i. §§ 48-55; he gives an exhaustive list of authorities. Good summaries are also given by Macleod, *Elements of Economics*, London, 1881, vol. i. bk. i. ch. v. §§ 8-11, ch. vi. §§ 1-10, and bk. ii. ch. i. § 48; and by Kleinwächter in Schönberg's *Handbuch der politischen Oekonomie*, Tübingen, 1882, vol. i. pt. v.—Read also Adam Smith, *Wealth of Nations*, ed. McCulloch, Edinburgh, 1850, bk. ii. ch. iii. and bk. iv. ch. ix.—Condillac, *Le Commerce et le Gouvernement*, Amsterdam, 1776, chs. ix. x.—J. B. Say, *Traité d'économie politique*, Paris, 1817, vol. i. bk. i. chs. i. ii. iv. v. xiii.—McCulloch, *Principles of Pol. Econ.*, London, 1844, Essay iii.]

**PRODUCTIVITY OF CAPITAL.** That the labour of men is rendered more efficient when that labour is assisted by capital, is accepted as a general truth by all. Something more than this is, however, implied when the statement is made that "capital is productive," and when the productivity of capital is assigned as a reason for and source of interest. It is implied in this, not merely that labour assisted by capital produces more commodities than labour which has less or no assistance, but that more value is produced; and not only that more value is produced, but that this addition of value to the product exceeds the value of capital consumed in the process. The expression of this by M. Paul Leroy-Beaulieu takes the form that the employment of capital saves time in the production which it assists—perhaps we should say labour-time—and that this saving in general exceeds the time, or labour-time, expended in the formation of the capital. This excess measures the productivity of the capital.

The school of writers represented and led by Dr. von Böhm-Bawerk, regarding value from an opposite point of view from that of the school of Adam Smith and Ricardo, find the idea of productivity of capital a stumbling-block. Value in their view rests on utility, and the value of capital and the value of labour depend on the value of the products they serve to turn out. From this point of view, capital cannot serve to produce surplus value, that is, to replace its own value, with a surplus, in its product, since the value of the products precisely determines the value of the productive instrument. The products are future, and the total present value of the future products of the instrument is the actual value which that instrument has. The present value is less than the future value will be, when the products are complete and become "relative to their users" present. This *agio* on present goods or discount on future goods, being dependent on mental estimates of future *versus* present, does not depend on the cost of production of the capital, and does not leave any room for surplus value to be produced by the capital as it is consumed in giving birth to products.

The other view of value readily finds a place for productivity of capital. The value of products being conceived as dependent on their cost of production, the effectiveness of effort directed towards their production by different methods is compared. If a process involving the preliminary formation of capital, to be subsequently used in producing the required commodity, be productive of a greater quantity, and a greater value, of the commodity than equal effort applied otherwise without the intermediate formation of capital would have produced, the extra quantity, or value, of product is attributed to the capitalistic process. On such a basis the idea already mentioned, of

such writers as M. Leroy-Beaulieu, in regard to productivity of capital, rests.

The closer analysis of ideas on the part of representatives of both schools of thought, in fact, attributes the productivity, not to the capital, but to the different processes of production. The more direct process of production is less effective (at any rate in general, and up to a certain point) than the less direct process. The one school thinks of the use of a greater amount of capital, the other, striving to penetrate to the foundation of things, discusses the more prolonged production process, and asserts an increase of productivity with the prolongation of the process. This idea is, doubtless, in general correct, but not of necessity, for invention may, as has been suggested (*e.g.* by Prof. Taussig), take the direction of pointing out ways of abbreviating productive processes while rendering them more productive; that is to say, not merely showing how productive processes of the old duration may be made more productive, but giving a maximum productivity for a process of shorter duration than the former most productive process. This shorter process may require a larger proportionate value of capital in the intermediate stages than the displaced processes, in spite of its whole duration being shortened.

So long as the leading conception in thinking of value is its measure by "cost of production," there is no difficulty about the idea "productivity of capital." But there is something like a negation of any possible meaning to it when value is conceived of as something determined wholly by utility, and when the comparison of present with future utilities is effected without reference to the production-costs of the sources of the one and the other. There is no room for a surplus of value to be produced by the capital, unless in that idea we comprise the gradual accretion of value as future ripens into present utility. We may go further, and say that, admitting that values tend to be proportionate to costs of production, this is effected by so distributing effort, in relation to utility aimed at, that equal effort realises equal utility in every direction. The value arises out of the utility of the resulting commodity, though it may preserve proportionality to the productive effort. From this point of view, the existence of a state of things such as that contemplated by M. Leroy-Beaulieu might perhaps be viewed as an indication of a misdirection of effort, since the realisation of greater value from the same expenditure of labour-time in one process than in another shows a want of balance between different processes, an absence of that equilibrium between the various phases of industry contemplated in most inquiries, where statical conditions are supposed achieved, or the statical condition which would equilibrate existing forces is sought. In fact, in a state of equilibrium,

it would be necessary to suppose that the surviving more direct processes of production were of such nature as to be equally productive marginally with the indirect processes adopted, that the indirect methods actually in use were all equally productive of value, or at any rate so nearly so marginally that no transference of effort from one to another could lead to increased production of value.

The adoption of indirect processes, given the sum of present effort available, must mean a lessened production of immediately consumable goods; and the extension of such processes will therefore cease when, by restriction of present goods and increase of the means of production of future goods, the short supply of present and the large supply of future goods is accommodated to the relative demand for these at the existing agio on present goods, granting that this agio is determinable.

In either case, whether we take the view of value which readily gives meaning to the phrase we are considering, or that which renders such meaning inconceivable, one thing is certain, and that is that we have to find some reason for the greater amount of product, or of value, which is, in the long run, given by indirect as contrasted with direct processes. Whether at some assumed agio on the present in comparison with the future, such sums of products have or have not an equal present value, is another question. It is not contested that the sum of the values, when they ripen into present values, of the utilities afforded by indirect processes of production, exceeds in general the sums of value attainable with equal effort in a directer process. The qualification "in general" simply applies to the fact that a *most productive* degree of indirectness exists. Further extension of processes of production beyond this point would involve smaller productivity, whether in present value of future utilities or in the sum of the values to be realised in the future by such utilities, *i.e.* whether by the sum of the discounted future utilities or of the actual future utilities.

The increase of product in indirect processes may be said to be due to the fact that certain natural forces or phenomena can be made to minister to the wants of man, on condition that he prepares means through which to utilise those powers. The wind will serve to grind his corn or move his goods from one place to another, provided he prepares sails and gearing to transmit their motion to grindstones in the one case, and a boat, ship, or barge fitted with mast and sails in the other. The pressure of the atmosphere helps him to use his physical strength to raise water from a well more easily than by lowering a bucket into it, if he prepares a pump with its necessary appurtenances. He may obtain fire more easily by rubbing a match on a duly prepared surface than by

rubbing two sticks together or striking flint and steel over tinder. The pressure of superheated steam can be made to move very heavy things and do a great variety of useful work if an engine properly designed to take advantage of that pressure be first constructed. To take one further example, the resistance offered to any propelling force used to move heavy goods is less if wheels be made and so arranged as to support the goods while they can turn freely, still more if they be made to run on a previously prepared track such as a well-made road or on rails such as tramways and railways utilise. These common examples are all cases where natural powers cannot assist man in obtaining utilities without the provision of what may be compared to a harness for those powers, or are cases where hindrances opposed by nature in the way of man's efforts to supply himself with utilities may be avoided by means of suitable provision of apparatus. The productivity of indirect productive processes will be found to be generally if not universally reducible to one or other of these heads. There are indefinite reserves of natural powers which can afford utilities to man, but only the barest minimum of utility is offered except on condition of intelligently directed effort on a man's part. As has been said, "The more man will do for himself, the more nature will do for him."

There remains the important question of the conditions governing the amount of the productivity of indirect as compared with direct processes of production. Here it may be said that the "law of diminishing utility" is constantly at work to limit the indefinite extension of the mere repetition of particular processes, aimed at producing a given commodity. The increase of quantity of commodity is met by a decrease of its marginal utility. On the other hand, new wants are being discovered, and new ways to satisfy old wants with reduced outlay. Scientific discoveries reveal ways of extracting utility from substances previously useless or even noxious, and old processes are replaced by new ones for obtaining many commodities. These things, together with the constant growth of wants, whether of individual or of community, and the extension of utilities formerly enjoyed by restricted sections of society, to new classes, afford opportunity for constant utilisation of increased quantities of effort in indirect processes of production, while the fuller satisfaction of wants, reducing the marginal utility of their further satisfaction, opposes the increase of value-productivity by extensions of individual processes beyond definite limits. There tends, therefore, to be a reduced yield of value through increase of supply of particular products on the one hand, an increase of value through discovery of new means of affording utility on the other hand. The latter includes the development of new wants and the discovery

of new methods of adapting natural powers to the supply of utilities to mankind.

[On this subject special prominence may be given to Dr. von Böhm-Bawerk's works translated by Professor W. Smart, under the titles, *Capital and Interest* and *The Positive Theory of Capital*. The former contains criticism of other writers, the latter the development of his own views. In addition, Leroy-Beaulieu's *Essai sur la Répartition des Richesses*, and some chapters of his *Traité théorique et pratique de l'Économie Politique* should be consulted, and the corresponding parts of the general treatises of numerous writers, particularly J. B. Say and Malthus. More or less on the subject is contained in almost every elaborate general treatise on political economy.]

A. W. F.

**PRODUIT NET.** The **PHYSIOCRATS** (*q.v.*), to whom we owe the distinction between gross and net national income, applied it in accordance with their cardinal doctrine that all wealth is derived from the land. Thus QUESNAY uses the term *produit net* as signifying the surplus of the raw produce of the earth left after defraying the cost of its production. He reasoned further that since natural agents are the sole source of wealth, and since only one class in the state—the class of agriculturists engaged in obtaining raw produce—pays rent for the use of natural agents, therefore the *produit net* is represented by this rent, which serves for the support of Quesnay's second or proprietary class, and the payment of his third or unproductive class of merchants, manufacturers, public officials, etc. On this theory it follows that the entire expenses of government are ultimately defrayed out of the rent received by the landlords; Quesnay was therefore consistent in proposing that all taxes should be repealed and replaced by an **IMPÔT UNIQUE** (*q.v.*) laid directly on the rent of the land (Quesnay, *Tableau Écon.*, London, 1894; *Physiocratie*, 102 *et seq.*).

Quesnay's reasoning suffers partly from the inadequacy of the physiocratic conception of **WEALTH** (*q.v.*, also **PRODUCTIVE LABOUR**), and partly from a misunderstanding of the origin and causes of **RENT** (*q.v.*). As M'Culloch shows (Introduction to Smith's *Wealth of Nations*, Edinburgh, 1850, p. xli.; note, p. 305; supplementary note on rent, p. 444), the payment of rent is not a necessary condition of agricultural labour, but arises only in an advanced state of society as "a consequence of the decreasing fertility of the soil, or of our being obliged to resort to inferior lands to obtain supplies of food for our increasing population." In any case, Quesnay was wrong in identifying rent with excess of price over cost of production (Malthus, *Principles of Pol. Econ.*, London, 1836, ch. iii. § 1).

[Smith (*Wealth of Nations*, bk. ii. chs. i. v.) and Lauderdale (*Inquiry into the Nature and Origin*

*of Public Wealth*, Edinburgh, 1804, pp. 122 *et seq.*) attempt to avoid the consequences of Quesnay's theory by classifying kinds of labour according as they increase not the *revenu net* but the *revenu brut*. But this does not touch Quesnay's real error. See Roscher, *System der Volkswirtschaft*, Stuttgart, 1880, vol. i. § 147.—Sismondi, *Pol. Econ.*, London, 1847 (Eng. trans.), p. 224, "On the National Economy, or the Income of the Community."]

E. R. F.

Reference may also be made here to recent support given to the practical issue of the *produit net* doctrine, though on somewhat different grounds. The late Henry George, through the study of the Ricardian theory of rent, and experiences of California and the mushroom rapidity of growth of great American cities, was led to depreciate the contribution of individual owners to the value of land; he considered the land in the main as directly God-given, and increased in utility by the progress of the community in wealth and numbers. Hence he was further led to consider the absorption of its increased values by individuals fundamentally unjust, and a great cause of modern poverty. Recognising, however, certain advantages in private ownership, he did not propose to abolish it, but preferred to secure for the community the rents under the form of a "tax" on land. This tax he persuaded himself would suffice to bear the whole burden of the expenses of the state. From a certain vigour of style and a directness of attention to the contrast between poverty and affluence which modern civilisation has not removed, his writings gained a hearing in England, while in the United States of America he was hailed as the leader of a considerable party. In 1892 he was run as a candidate for the presidency, and in 1897 he was actually engaged in the contest for the first mayoralty of Greater New York when he died, Oct. 1897, within three or four days of the election.

[H. George, *Progress and Poverty*, 1879; *Social Problems*.]

A. C.

**PROFICUUM.** See **FARM OF THE COUNTIES**; **INCREMENTUM**; **PIPE ROLLS**.

**PROFIT**, originally a vague word signifying any kind of gain to obtain which some expense or risk must be incurred, has had various narrower significations attributed to it by the definitions of economists.

Adam SMITH, when classifying the national income under the three heads of wages of labour, profits of stock, and rent of land, says that wages are "confounded with profit" when the term "profits" is applied to the whole of the gains of a working farmer or of an independent artisan. A part of these gains, he explains, is wages due to the farmer as labourer or overseer, and to the independent artisan as journeyman. Though he does not lay down any rule on the subject, it may be gathered from his refutation of the proposition that profits "are only a different name for the wages of a particular

sort of labour," that he would decide how much of the gains of any particular capitalist is true profit by means of a comparison of the total with the amount earned by non-capitalists by performing similar labour (*W. of N.*, bk. i. ch. vi.). RICARDO, James MILL, and MALTHUS in his *Political Economy* did not subject the idea of profits to analysis. But Malthus in his *Definitions* (1827) divides "the gross profits of capital independent of monopoly" into (1) "net profits" or "interest," and (2) "the profits of industry, skill, and enterprise" (*Definitions* 34 and 35). M'CULLOCH, in the 2nd ed. of his *Principles*, makes the same division of "gross profits" into (1) net profits or interest, and (2) "wages or remuneration of the capitalist for his skill and trouble in superintending" the employment of his capital, and "compensation for such risks as it might not be possible to provide against by an insurance" (p. 506). J. S. MILL (*Unsettled Questions*, pp. 107-109, and *Principles*, bk. ii. ch. xv. § 1) treats profits as including the whole of the gains of the capitalist, whether due to the mere possession of capital, or to that and the performance of labour and the undergoing of risk. FAWCETT (*Manual*, bk. ii. ch. v.), JEVONS (*Primer*, p. 52), Marshall (*Principles*, vol. i. 1st ed. p. 142, 3rd ed. p. 156) adopt the same course. Some writers, however, e.g. ROGERS (*Manual*, ch. xi.), B. PRICE (*Practical Political Economy*, ch. v.), C. L. SHADWELL (*System*, p. 158), follow Adam Smith's plan of regarding as profits proper only that portion of the capitalist's gain which he may be supposed able to obtain without personal labour and if fully insured against risk, while F. A. WALKER, on the other hand, desires to apply the term "profits" only to the other portion of the entrepreneur's gain, namely, that which is over after deducting interest on all the capital he employs, whether it belongs to himself or to another person (*Political Economy*, 1885, p. 247). In practical life the term "profits" is used in all three senses with almost equal frequency. It would be applied without hesitation (1) to the total gain of an individual capitalist employing none but his own capital, and personally performing all necessary labour of management (Mill's profits), (2) to the gains of a joint-stock company or private firm in the case of which all labour of management was paid for by fixed salaries (Adam Smith's true profit), and (3) to the net gain of an entrepreneur employing no capital of his own (Walker's profit).

The earlier 19th century economists, believing that profits in the larger sense were to be regarded as a residue left to employers after payment of rent and wages, assumed that both elements rose and fell together, and in consequence of the same causes. The assumption is unfounded, and it is necessary to consider the two elements separately. As regards the in-

terest element, the kernel of the modern theory is as follows: An isolated individual will often find it advantageous to spend a certain portion of his time in increasing his stock of useful things by the addition of fresh instruments or other objects the enjoyment of which is not immediate but spread over a length of time. The time may be short, as in the case of a stock of grain to last till the next harvest; or moderate length, as in the case of a spade; or interminable, as in the case of the diversion of a stream into a new channel. In deciding what work of this kind he will undertake, the isolated individual will be guided by the relative "profitableness" of the different kinds of work open to him. The "profit" will be reckoned by the amount of future annual labour the work will save him, or, which comes to the same thing, the amount of additional annual income it will enable him to obtain without increasing his annual labour. He will not, for example, first divert stream B at the cost of ten days' labour if that will save him one day's labour per annum ever after, and he knows that to expend ten days' labour in diverting stream A would save him two days' labour per annum ever after. But if he is able to go on accumulating, and knows of no better investment, he may divert stream B after he has diverted stream A.—The rate of interest he obtains would then fall from twenty to ten per cent per annum.—The introduction of other individuals practising exchange of commodities and services does not alter the essential features of the process. The isolated individual, in adding to his stock, selects the most profitable investments known to him first, and so, on the whole, does a number of individuals holding private property and practising exchange. The only important difference lies in the fact that in the latter case the investment and the profit are both reckoned by their value in money, instead of directly by the amount of labour expended and the amount of labour periodically saved, or amount of utility periodically gained. Consequently, in the highly organised modern community as well as in the case of the isolated individual, accumulation tends to cause a fall in the rate of interest, and if there were no change in men's knowledge of profitable investments, the rate could only be maintained or increased in face of accumulation by an increase of population proportionate to or greater than the increase of accumulated useful things. But men's knowledge of profitable investments does not remain the same. Inventions are continually being made which either reveal new profitable investments unknown before, or reveal direct methods of production which enable men to dispense with the additions to the accumulated stock which would otherwise have been profitable. Invention thus sometimes tends to raise the rate of interest, and sometimes, but probably

far more seldom, tends to lower it. The discovery of a practical method of applying steam power to locomotion is the stock example of an invention which caused a considerable pause in the downward progress of the rate of interest by providing a new investment of enormous magnitude. There is no such striking instance of the other kind of invention, but the discovery of means of sending several telegraphic messages at once on the same wire is a case. To this theory, which bases the determination of the rate of interest entirely on the productivity of the marginal investment, it is sometimes objected (e.g. by H. J. Davenport, *Outlines of Economic Theory*, 1896, § 114) that the demands for loans for consumption by spendthrift individuals, belligerent governments, and others, obviously affect the rate of interest. This is true enough, but it must not be forgotten that if B borrows and spends as income all that A saves, there is no accumulation of capital. Borrowing for consumption or unproductive purposes tends to raise the rate of interest simply because the consumption tends to reduce the accumulation of capital, and therefore tends to make the rate of interest obtainable in the marginal productive investment higher than it would otherwise be (see INTEREST).

A high rate of interest, or, as it is more often elliptically expressed, "high interest," does not necessarily mean that the aggregate amount received as interest is high, nor that individual interest-receivers are paid a large amount per head. It only means that the ratio of interest to principal is high. The importance of this ratio is obvious; the annual return to be expected from further savings is indicated by it. But the ratio between profits in the narrower modern sense—i.e. the earnings of business management by the capitalist, or profits in the wide sense after deducting interest—and the capital of the profit-receiver is not of much importance, and little but vague generalities can be laid down respecting it. As between trade and trade at the same time it will depend on the amount and value of the labour performed by the profit-receiver compared with the amount of the capital required. The rate of profit, exclusive of interest, obtained by Adam Smith's "apothecary" (*Wealth of Nations*, bk. i. ch. x.) was high because the amount and the value of his labour were large in proportion to his small stock of drugs. Marshall's rolling-mill proprietor, on the other hand (*Principles of Economy*, 3rd ed., 1895, vol. i. p. 691), obtains a low rate of profit, exclusive of interest, because in proportion to his enormous capital his labour is of little account. The same rule holds good of the rate of profit, exclusive of interest, in the same trade at different times. A large and well-paid portion of apothecaries' labour having been taken over by medical men paid by fees, and the stock of drugs required having consider-

ably increased, apothecaries' profit has ceased to be "a bye-word denoting something uncommonly extravagant." The value of the labour of the capitalist will vary in consequence of the same causes which bring about variations in wages (see WAGES). Its amount varies with changes in the organisation of industry. The general introduction of the joint-stock company system, for example, has reduced the average rate of profit, both by throwing open to all competent persons certain labour formerly confined to capitalists, and thereby reducing the value of that labour, and by diminishing the amount of the labour performed by capitalists by handing over a portion of it to wage-paid managers and others. (For Walker's theory of profits see RENT OF ABILITY.)

A third element is sometimes said (e.g. by J. S. Mill, *Principles*, II. xv. § 1) to be present in profits, viz. "compensation for risk." Here we must distinguish between the profits of a single particular investment and the average profits obtained from a particular class of investments. If every one calculated risks perfectly accurately, and if chance of loss were generally reckoned as exactly counterbalancing an equal chance of gain, competition would so regulate the supply of capital that the successful investments in the more risky classes would pay just enough, and no more than enough, to counterbalance the losses incurred in the unsuccessful investments. Each particular successful investment would bring in something which might be called "compensation for risk," but the average of profits obtained from the whole class would contain no such compensation. If, of course, it were generally recognised that a chance of loss outweighs an equal chance of gain, competition would so regulate the supply of capital that the riskier classes would return on the average somewhat higher profits than the less risky. There is, however, no evidence that this is the case. The probability is that the classes of investments which on the average return most to the investor are neither the very safest of all nor the very-riskiest, but the intermediate classes which do not appeal either to timidity or to the gambling instinct.

[A very complete bibliography will be found in Böhm-Bawerk, *Capital and Interest*, a *Critical History of Economical Theory*, 1884, transl. by Smart, 1894, in the Index of the authors mentioned in the work at the end of the volume. See also the authorities quoted in the text above and under INTEREST. Marshall in *Principles*, vol. i. 3rd ed. bk. vii. chs. vi.-viii., deals with the remuneration of business management more completely than his predecessors. Wieser's *Natural Value*, transl. by Malloch 1893, shows how the main principles of the theory of interest are independent of any particular social organisation.] E. C.

PROFIT AND LOSS ACCOUNT. See art. on BALANCE SHEET, in which reference is made to the point under Heading vii.

PROFIT SHARING is a mode of industrial remuneration under which those employed receive, besides their salary or wages, a stipulated proportion of the net profits of the year, either in cash or deferred advantages. This definition excludes cases where an unfixed bonus is distributed, at the discretion of the employer, but this "chrysalis stage" has not seldom led to profit-sharing proper. The amount of remuneration received varies very greatly, but, in the majority of cases, is, roughly speaking, from 4 to 10 per cent of the wages of the year. Where the benefit is prospective, a definite share of the profits is either paid over to a provident fund against old age or sickness, or invested, on behalf of the workmen, in the shares of the employing company. Whatever, however, be the form it takes, the *raison d'être* of profit-sharing remains the same. The present time-wage system, it is contended, gives no incentive to the workman to work his best, while piece-work is often impossible, and, in any case, tends to an increase of quantity, at the expense of quality. By profit-sharing it is sought to enlist the interests of the workman on the side of the employer. A new source of profit is thus opened, which benefits labour, without diminishing the returns of capital. The sources of this profit spring from a reduction in the waste of material, an improvement in the work done, economy in supervision, avoidance of strikes, a greater stability in the staff, and, lastly, from the enlistment, on the employer's behalf, of the men's best faculties—suggestions as to improvements and new processes being thereby obtained. If these claims be good, and they are advanced by practical men, who have made trial of profit-sharing, they afford an obvious answer to the argument that the system is unfair because the workmen do not share losses as well as profits. A more formidable criticism is, that inasmuch as profits mainly depend on causes over which workmen have little control, it is illogical that they should enter into the calculation of wages. For this reason some economists would prefer what they term a PROGRESSIVE WAGE (*q.v.*), but in any case there is room for a variety of systems.

Profit-sharing was first adopted in England by Lord Wallscourt about 1832; the credit of its introduction into France, in 1842, is generally ascribed to a Frenchman, LECLAIRE (*q.v.*). In England the first notable trial of it was made by H. Briggs and Co. in 1865, at their Whitwood collieries. The experiment was a failure, and after nine years the system was abandoned. Its introduction had been widely blazoned abroad, and had met with the warm approval of J. S. MILL, W. T. THORNTON, and H. FAWCETT, hence its failure became equally conspicuous. It is to this, in great measure, that the little progress made in the

ensuing years must be ascribed. There had, however, been special hindrances at work in the Briggs case. Before the introduction of profit-sharing, the relations between masters and men had been extremely strained, and a quarrel about the local trades union supervening before mutual confidence had been established, created distrust of the system, both among the men and the shareholders. Among English firms that still continue the system, there is one, Messrs. Fox of Wellington, Somerset, which adopted it in 1866, but it was not till 1889-91 that the progress of the movement became rapid. During these three years profit-sharing was adopted by no less than fifty firms. Of individual cases of profit-sharing firms, among the more notable are:—

1. South Metropolitan Gas Co., 3000 to 3900 employees.
2. Sir Joseph Whitworth and Co., engineering works, Manchester, 2000 employees.
3. Brush Electrical Engineering Co., 1010 employees.
4. Messrs. Cassell and Co., printers, 1150 employees.
5. Messrs. Clarke Nicholls and Coombe, confectionery manufacturers, London, 1200 employees.
6. Messrs. W. and H. Wills, Bristol, tobacco manufacturers, 1460 employees.

In 1894 Mr. Schloss reported on 152 experiments, of which 101 were still being carried on; only in 16 of the failures did he attribute the abandonment to dissatisfaction with the system. Upon the other hand, it is disappointing to find that no great extension of the system appears to have taken place in subsequent years, and that the important firm of Messrs. Watson and Viney, printers, have discontinued the system on the ground that "profits had not for some time allowed payment of bonus."

The profit-sharing scheme of the South Metropolitan Gas Co. calls for special notice. It is an extension to the employees of the principle of the sliding scale, whereby the dividends are regulated by the price of gas; any increase of the one involving a diminution of the other, and *vice versa*. The condition of acceptance of this bonus is willingness to enter into a contract of service for a limited period not exceeding twelve months. The bonus percentages during the years 1890-1896 were 5, 5, 3, 4, 6, 6, and 7½. In 1894 the percentage rate was increased on condition that one half of each man's total bonus shall be invested in the company's ordinary stock; the other half being payable in cash annually as before. It was already possible to leave the bonus on deposit with the company at 4 per cent. About 2500 profit-sharing stockholders held in 1897 stock to the market value of about £60,000, while there was a further sum of about £27,000 on deposit.

The South Metropolitan Gas Act 1896 provides for the appointment of one or more directors, not exceeding three, by the profit-sharing employees. Such directors must, however, have been at least seven years in the constant employment of the company, and must have held for not less than twelve months not less than £250 worth of stock. For present arrangements see article on CO-PARTNERSHIP in Appendix.

In all, it is estimated that there are at the present time nearly 100 firms practising profit-sharing, employing from 48,000 to 50,000 persons. Besides these are such of the co-operative productive societies as have introduced the system, *e.g.* the Scottish Wholesale Society, the Hebden Bridge Fustian Society, and the Leicester Boot and Shoemaker Society. It must, however, in fairness be admitted that, in spite of general motions passed at co-operative congresses, the system does not seem greatly to commend itself to the rank and file of workmen co-operators (see "Co-operation and Profit-sharing," by B. Jones, *Economic Journal*, vol. ii. p. 616).

With respect to profit-sharing generally, there is one remark of a disappointing character. Whereas it was the expectation of its early advocates that a half-way house might thereby be provided towards real industrial partnership, the profit-sharing of to-day is, except in the case of the South Metropolitan Gas Co., hardly tending in this direction. Still, on whatever lines, the advance up to a certain point has been so great that it is natural to consider how far profit-sharing would admit of general extension, and thus serve to point the way to "industrial peace." On this question the warning is needed that nothing could be of more sinister omen to the future of profit-sharing than an indiscriminate application of it by all sorts and conditions of employers. Seeing that the supply of unskilled labour is generally in excess of the demand, the inevitable result would be that, in the absence of means such as trades unions to maintain a certain rate, wages would fall in proportion, so that what was gained with one hand would be lost with the other. Even at present, trades unionists are ready to suspect profit-sharing firms of wishing to bring down wages, and though generally this is altogether untrue, in one case a firm giving the high bonus of 26 per cent was found to be paying its workmen less than the recognised wage. Nothing could be more disastrous for profit-sharing than for such cases to multiply. Moreover, it must be remembered that there are industries such as cotton-spinning, etc., in which interest on capital fixed in machinery is the chief element in cost price, and in which piece-work is especially convenient, so that profit-sharing could give little new benefit to the employer. Still, within these limitations there is room for much

development; which, however, two influences may tend to retard. On the side of the employee, there is danger from the "new unionism"; on that of the employer, from the tendency of the time, which Mr. Goschen has noticed, for the shares in industrial partnerships to become divided among a great number of small proprietors. The attitude of leaders of working men such as Mr. Burt and Mr. G. Howell has, it is true been and is friendly to the movement, but these men are strong "individualists," and the new school of trades union leaders, who believe much in the action of the state and little in that of private individuals, will hardly view with favour a system which cannot but tend, to some extent, to give workmen interests separate from those common to all fellow-workers in their trade. On the other hand, the small investor, who has perhaps bought his shares in the open market at a high premium, and who is getting a return of not more than 5 per cent on the money laid out, may view with jealousy a system which at any rate appears to be intercepting some of the profits. The conviction is forced upon one that only a strong chairman could have carried through the South Metropolitan Gas Co.'s scheme noticed above. However, there is little reason to fear but that there will be many worthy successors to the present profit-sharers, who have found by experience that "it is twice blessed; it blesseth him that gives and him that takes."

[D. F. Schloss, *Report on Profit-sharing*, Board of Trade Labour Department (c. 7458), 1894, contains an exhaustive history of British profit-sharing, with tabular statements of particulars. For most purposes this has superseded the previous Board of Trade Report of 1891.—It has been brought down to date in subsequent numbers of the *Labour Gazette*, July 1895, 1896, 1897, and Aug. 1898.—N. P. Gilman, *Profit-sharing between Employer and Employed*, London, 1889, 8vo. This is the leading general book on the subject in English. The French translation of Böhmert's *Die Gewinnbetheiligung*, Leipzig, 1878, 8vo, by A. Trombert, with a preface by C. Robert, Paris, 1888, 8vo, brings down the elaborate German work to the later date.—Sedley Taylor, *Profit-sharing between Capital and Labour*, London, 1884, 8vo; a reprint of essays which did much to arouse public interest on the subject.—T. Bushill, *Profit-sharing and the Labour Question*, London, 1893, 8vo; in part a reprint of evidence given before the Labour Commission, states the case from the side of a practical employer.—D. F. Schloss, *Methods of Industrial Remuneration*, London, 1893, 8vo; contains a very subtle and acute treatment of profit-sharing.—Among earlier notices of profit-sharing by Thornton, Mill, etc., may be mentioned the first advocacy of it by Babbage in the chapter—"a new system of manufacturing"—in his work *On the Economy of Machinery and Manufacture*, London, 1833, 3rd ed., 8vo.—Consult the quarterly *Bulletin de la participation aux bénéfices*, Paris, published by the association of French

employers for the practical study of the question.—The *Quarterly Journal of Economics*, Boston, vol. i. p. 232, contains an able article by R. Aldrich directed against the principle of profit-sharing.—For methods of participation, consult *Profit-sharing Precedents*, London, 1891, 8vo, by H. G. Rawson; with regard to South Metropolitan Gas Co., see letter to *Times* of 2nd January 1897, from Mr. G. Livesey, and Reports of Annual Meetings].

PROFITS À PRENDRE. See PROPERTY, p. 230.

#### PROGRESS, INFLUENCE OF, ON VALUE.

One consequence of the economic advance of society is a disturbance in relative values. As these are proximately determined by the conditions of supply and demand, it is plain that changes may arise either on the side of demand or on that of supply. When population increases, and wants expand, demand becomes on the whole greater, though it is very unequally distributed, and, brought into relation with the conditions of supply, produces different effects. Raw produce being obtained under the law of DIMINISHING RETURNS (*q.v.*), tends to rise in cost as larger amounts are needed. Manufactured goods, coming under the law of INCREASING RETURNS (*q.v.*), rather tend to fall. Hence the first of the derivative laws of value, viz. that manufactured goods fall relatively to raw produce. Money being a product of mines, it follows that manufactures tend to fall in PRICE as well as in VALUE.

Within each of the two great groups just mentioned there are several subdivisions. Thus Adam SMITH distinguishes between "three different sorts of rude produce" (bk. i. ch. xi.); the first, consisting of those things whose supply it is hardly possible to increase, may rise in value to any point to which effectual demand will ascend. Scarcity makes the value of such articles depend altogether on the demand. In a second class, where the power of industry in increasing supply is more effective, the value rises with the cost of producing the most costly portion of the commodity, and more especially in the case of the chief articles of food, the movement of value is guided by that of population. Corn cannot exceed in value the purchasing power of the consumers. There is, therefore, an element of truth in the idea of Adam Smith and Cairnes, that corn oscillates about a fixed-value point (*Wealth of Nations*, bk. i. ch. xi.; cp. *Leading Principles*, pt. i. ch. v. § 3), though the variations in the standard of living produce considerable fluctuations in this level (cp. Marshall, *Principles*, bk. vi. ch. xii. § 5). Meat, again, rises from a very low point until it becomes much more valuable than grain.

A further set of influences on the products of extractive industry comes from the varying portability of the articles. The value of such

a commodity as timber does not rise so rapidly with the progress of a new country, but it rises greatly all the world over in the course of centuries.

Accessory products—such as hides and wool—have their values affected by those of the commodities with which they are closely connected. As meat rises, these accessory products tend to fall, but demand may be so increased as to raise both classes.

Minerals stand somewhat apart. Though they are, strictly speaking, limited in supply, yet the discovery of fresh fields, and the great improvements in working, tend on the whole to counterbalance the influence of scarcity so that, as against extractive products generally, they have not risen. In like manner manufactures can be grouped into classes. Those in which the raw material forms a large part of the value would naturally tend to rise. Where machinery and invention have been most developed to meet extensive demand, the fall ought to be most conspicuous. But both circumstances are often conjoined—as in the case of the textiles consumed by the poorer classes—and in that case the latter element on the whole prevails. Owing to the higher value of special skill, the more finely-wrought products worked by hand tend to rise.

The underlying conditions of increasing and diminishing returns are affected by the opening up of fresh sources of supply through improvements in transport, and particularly by the expansion of foreign trade. In this latter case the results are that (1) imported products fall in value; (2) raw produce exported tends to rise; (3) manufactured exports tend, generally speaking, to fall.

So far as regards the temporary fluctuations of the market, two sets of influences operate, viz. (1) the widening of the circle of exchanges, which tends to produce greater steadiness; as exemplified in the infrequent occasions of famines in modern times, and (2) the greater complexity of modern trading, which makes values less stable. But there is no doubt that retail values are far steadier than formerly.

The values of services are also affected in similar ways. Thus the tendency in recent years has been for unskilled labour to rise relatively to the lower forms of skill which are easily and cheaply acquired. The higher forms of skilled work depending on exceptional natural ability are, however, affected by the absence of an adequate supply and by the greatly increased demand. Hence the value of such services is now higher than ever (see WAGES, NOMINAL, AND REAL).

[See Adam Smith, *Wealth of Nations*, bk. i. ch. xi.—J. S. Mill, *Principles*, bk. iv. ch. ii.—J. E. Cairnes, *Leading Principles*, pt. i. ch. v.—A. Marshall, *Principles of Economics* (3rd ed.), bk. vi. ch. xii. §§ 1-5.]

C. F. B.

PROGRESSIVE TAXATION. See TAXATION; GRADUATED TAXATION.

PROGRESSIVE WAGE, a mode of industrial remuneration, under which those employed receive, besides their time or piece-wage, a further premium or bonus in return for any efficiency shown by them beyond a specified degree. This premium may either vary according to the ability of the workman, or be a fixed sum after the defined standard has been reached. It may be given for the quality or for the quantity of the work done, and the recipients of it may be either individual workmen or collective groups. The term was first employed by M. Paul Pierre Leroy-Beaulieu, *Essai sur la répartition des richesses et sur la tendance à une moindre inégalité des conditions*, Paris, 1881, 2nd ed. 1883, 3rd ed. 1888, 8vo, and is fully treated in ch. vi. and vii. of Schloss, *Methods of Industrial Remuneration*, London, 1892, 8vo. Mr. Schloss refers students of the subject to *Rapports et documents de la section d'économie sociale*, Lyons, 1889.

H. E. E.

PROMISSORY NOTE. By § 83 of the Bills of Exchange Act 1882, a promissory note is defined as an unconditional promise in writing made by one person to another, signed by the maker, engaging to pay on demand, or at a fixed or determinable future time, a sum certain in money, to, or to the order of, a specified person or to bearer. And by § 85 of that act, a promissory note may be made by two or more makers, and they may be liable thereon jointly, or jointly and severally, according to its tenor.

By § 89 the provisions of the act relating to bills apply, with the necessary modifications, to notes, the maker of a note corresponding with the acceptor of a bill, and the first indorser of a note corresponding with the drawer of an accepted bill payable to drawer's order. Protest of a dishonoured foreign note is, however, unnecessary.

A note made in the United Kingdom must bear an impressed *ad valorem* stamp. The Stamp Act of 1891 defines the term "promissory note" for its own purposes in somewhat wider language than the act above cited, so that instruments which would not be called in commerce promissory notes may require to be stamped as such, as for instance promises to pay out of a particular fund or on a contingency.

[See Chalmers on *Bills of Exchange*, ed. 4, and Byles on *Bills of Exchange*, ed. 15.] M. D. C.

See BANKING, BANK NOTE; BILL OF EXCHANGE.

The usual form of a promissory note made by a single individual is as follows:—

Due 4th July 1897.

London, 1st January 1897.

Six months (or any other time) after date I promise to pay (here insert name of the person to

whom the debt is due) or order five hundred pounds value received.

Signed, A. B.

(The name of the maker of the note.)

PROMISSUM. A fine or levy offered in lieu of personal service and taken as part of a scutage or aid. *Scutagium Promissum* occurs in the *Red Book of the Exchequer* for the composition of non-effective tenants towards the levy for the scutage of Toulouse (1159). Hence *promissum* became a term for a *scutagium* or other feudal levy, which was said to be promised or compounded for in advance by the tenant. When the composition for scutages and military services became general, the word naturally became obsolete (see KNIGHT'S SERVICE).

A. E. S.

PROMOTER. The word is generally used to denote one who is connected with floating joint-stock companies by procuring the assistance of brokers and underwriters to arrange for the issue of shares, and by forming the first board of directors. His connection with the company usually ceases with the commencement of its business career, but the tendency of recent decisions and legislation has been towards fixing the promoter with some greater degree of responsibility towards the shareholders. The inception of a public company frequently offers to the promoter the opportunity of securing large profits at the expense of the future shareholders, and this opportunity has been, in many instances, so unscrupulously used as to bring the office into great disrepute. But his functions, properly exercised, are both legitimate and useful, and have played an important part in the growth of joint-stock enterprise.

R. W. B.

PROMPT. The date of payment under a contract of sale. In certain trades, goods sold under a "fourteen days prompt," or two or three months prompt, may be taken up earlier upon payment, but are at the latest to be paid for at the time indicated.

## PROPERTY.

Property, the Right of, p. 228; I. What is meant by the Right of Property, p. 228; II. Restrictions on the Right of Property, p. 229; (a) Right of Possession, p. 229; (b) Right of Enjoyment, p. 229; (c) Right of Alienation or Disposition, p. 230; III. Divisibility of the Right of Property, p. 230; (a) Servitudes or Easements, p. 230; (b) Pledge or Mortgage, p. 230; IV. Origin of the Right of Property, p. 230; V. Grounds on which the Right of Property has been Justified, p. 231; VI. Real and Personal Estate, p. 233.

PROPERTY, THE RIGHT OF.—I. *What is meant by the Right of Property.*—The right of property is described by Professor Holland in his *Jurisprudence* as an extension of the power of a person over portions of the physical world. In its primary sense the proprietary right has reference to some material object. Further, it is what jurists term a right *in rem*,—that is, a right available against all persons other than the one invested with the right, like the right to life or to reputation, as distinct from a right *in*

*personam*,—that is, a right available only against some particular individual or individuals, such as a right arising out of contract. Thus the right of property is on its negative side a right which one person has to prevent every other person from meddling with a given material object. A correlative duty not to meddle with that object is imposed on every person other than the proprietor. For this reason KANT has observed that a man alone in the world could not be proprietor of anything, for there would be nobody to exclude from dealing with material objects. On its positive side the right of property does not readily admit of exact definition. It may be described as the amplest right of dealing with a material object known to the law. It may thus be distinguished from the right of possession, the *prima facie* right not to be disturbed, which the law recognises in him who actually has, and means to exercise control over, a thing, although he may have no legal title to it. More definitely the right of ownership may be said to include a right of possession, a right of enjoyment, and a right of disposition or alienation. But the signification of the term proprietary right is often extended by lawyers, and still more by the public, to include a variety of rights to which no material object corresponds, or which are only available against specific parties, but which have an exchange value and admit of pecuniary estimation. A recent English statute makes it larceny to abstract electricity belonging to another man, thus acknowledging that force as distinct from matter may become an object of property in the fullest sense. We call such an "incorporeal hereditament" as an advowson, property, though it is merely the right to appoint to an office of a certain kind. We call a franchise, such as the right to hold a fair or market, property (see FAIRS AND MARKETS; MARKET AS PLACE OF SALE). We apply the same term to various monopoly rights, such as copyright, a patent right, or a right to use a particular trade mark (see COPYRIGHT; PATENT; TRADE-MARK), though these are merely powers of hindering others from doing certain things. The right to have a contract performed, as well as the right to recover damages for a breach of contract or for a civil injury sustained, are by English lawyers termed CHOSSES IN ACTION, and ranked under the head of personal property. So likewise are shares in a joint-stock company, which are really nothing more than rights to receive certain sums of money and to exercise certain rights under certain conditions. In ordinary conversation we speak of the GOODWILL and the book debts of a business (see DEBT) as property. In these and in other instances that might be cited we include in the term property everything which has pecuniary value. It is property in this extended sense of which we are thinking when we discuss the

advantages or disadvantages of the institution. It is property in this extended sense which forms the object of economic study. Property in this wider sense, however, rests on property in the narrower sense, the exclusive control of particular material objects by particular individuals. On the other hand, certain material objects such as air and running water have commonly been held incapable of appropriation. Wild creatures—beast, fowl, and fish—are not objects of property so long as they remain in their wild state. They admit of property only when they have been killed or tamed. Hence the enactment in so many countries of laws intended to protect the monopoly of sport (see GAME LAWS). Other classes of material objects have been regarded by particular legal systems as at least incapable of private ownership. Under the Roman law consecrated buildings and places of interment and the walls and gates of cities were so regarded. Roads, harbours, the beds of rivers, and the use of their banks, were also withdrawn from private ownership and termed public things. Similar restrictions of the range of private ownership may be found in modern systems, and it is frequently debated among ourselves whether public authorities should not have a monopoly of certain undertakings. It may be noted that there is nowhere any precise legal definition of a material object.

## II. *Restrictions on the Right of Property.*—

The exercise of the rights above said to be comprised in the proprietary right, is not, however, unlimited. Thus (a) as regards the right of possession, the proprietor, without giving up his property, may legally deprive himself of control over it to a greater or lesser extent, for a longer or shorter time, and then he remains bound by his own act. The owner of a house has no right to live in it when he has let it to a tenant. The owner of a watch has no right to take it out of the keeping of the pawnbroker to whom he has pledged it.

(b) As regards the right of enjoyment, the *jus utendi et abutendi*, the right of getting whatever profit or pleasure can be got out of the object of property, the proprietor is again restricted in various ways. In the first place the state may take, by way of taxation, an undefined proportion of property or of the income arising from property. The state reserves to itself the right of buying compulsorily any property which may be necessary for the public service, and it confers this right upon various corporations, such as railway companies. In the second place, restraints are imposed on the proprietor's use of his property in order to prevent his injuring his fellow-citizens. The principle of these restraints is expressed in the maxim, *Sic utere tuo ut alienum non laedas* (So use your own as not to injure what is another's), but its application is more

restricted than this statement would suggest. A man may do many things with his own property which interfere with the interests or enjoyment of other persons. Nevertheless there are limits to his freedom in this respect. Thus a proprietor may not accumulate upon his premises nuisances dangerous to life and health. He may not discharge unlimited quantities of smoke from his chimneys. He may not keep buildings which overhang a thoroughfare in a rickety and dangerous condition. He may not expose in his windows writings or pictures which outrage decency. He may not carry on dangerous or offensive trades, such as the manufacture of explosives or manures, save under the conditions prescribed by law. Similarly a man may not drive his horse and cart at a dangerous speed or discharge his gun in a public thoroughfare. In the third place, where the object of property is a sentient being, the owner's power of inflicting pain has been limited by the most civilised systems of law. Thus under the emperors the Roman law came by degrees to protect the slave from being killed or tortured by his master, and in several countries at the present day gross and wanton cruelty to animals is a punishable offence.

(c) The right of alienation or disposition has at different times been subject to different restrictions. The power of alienation in the owner's lifetime, is restricted generally in French Law, and as regards English Law, was curtailed with reference to an important species of property by the strict feudal law of entail. Lastly, certain acts of alienation have been rendered illegal as contrary to public policy (see ENTAIL, LAW OF).

When this country is neutral in a war it is an offence for a British citizen to supply either belligerent with ships, arms, or military stores of any kind. The law did not formerly enforce a conveyance of English land, and does not now enforce the transfer of an English ship—to an alien. Similar examples of restraints upon alienation might be multiplied.

Again, the testamentary power arose at a comparatively late period of history, and has often been narrowly limited. We are told that at Athens even the childless man could not dispose of his estate by will until the time of Solon's legislation, 594 B.C. The testamentary power is said to have been first recognised in Rome by the law of the Twelve Tables, 450 B.C. Even in the later Roman law children who had been disinherited without cause could recover part of the estate by the *querela de testamento inofficioso* (plaint of an undutiful will). Early English law similarly recognised the claims of the family. Later in the middle ages the testamentary power over land was restricted by the institution of entails. In modern times the feeling that the estate belongs to the family rather than to its

head, and the revolutionary abhorrence of PRIMOGENITURE, produced the clauses in the *Code Napoléon* which limit the power of testamentary disposition to one-third of the estate if the testator has two children; to one-fourth if he has three, and so on in proportion, and similar provisions are found in all continental systems of law. Even where there are no children the *Code Napoléon* reserves a portion of the estate to surviving parents (see BEQUEST, POWER OF).

III. *Divisibility of the Right of Property.*—The right of property is to a certain extent divisible. An instance of this divisibility is seen in the extraordinary number of interests which English law has allowed to be created with reference to the same piece of land. Another instance, common to all civilised systems, is found in *jura in re aliena*, rights held by one person over the property of another independently of the owner's consent, and available not only against him but against all third parties. These rights fall under two principal heads—(a) what the Romans called SERVITUDE, and we call easements (see EASEMENT) or *profits à prendre*—rights to use or enjoy another man's land for a particular purpose, e.g. to walk or ride across it, to receive a stream of water across it, to dig turf or gravel, and so forth; (b) the right of pledge or mortgage, the right of a creditor to whom property has been pledged or mortgaged to keep it until he has been paid, and in case of default to sell it or to foreclose, and himself become the owner.

IV. *Origin of the Right of Property.*—Such being in outline the right of property, we have next to consider how this right came into existence. The original motive power of appropriation was undoubtedly the blind instinct to live and to enjoy. No question of moral right or of public expediency would have occurred to a primitive savage in want of food or shelter. The idea of moral or legal right to property came later by a gradual evolution. The early forms of property have, in our own time, attracted the attention of lawyers, historians, and economists. Much curious information has been collected, but none of the theories yet propounded can be taken as fully proved. It is a very general opinion that some form of joint ownership preceded the appearance of full individual property. That in early times the family rather than any of its members was regarded as the real proprietor seems to be established. The theory of the village community in the east and in the west, so attractively set forth by Maine, has been reduced to uncertainty by recent criticism. FUSTEL DE COULANGES, Seebohm, and Baden Powell have shown that the evidence in favour of what is known as the "mark system" in western Europe, and of the village community in India, is by no means conclusive (see VILLAGE COMMUNITIES). In the higher

stages of progress individual property appears, as well as in the most civilised states, ancient and modern, all but universal.

V. *Grounds on which the Right of Property has been Justified.* From early times the advisability of maintaining the right of individual property has been called in question. It is obvious to every reflecting person that, even under the best legal systems yet devised, property is often acquired and distributed in unsatisfactory ways. Whilst some attain wealth by mere luck or by sheer dishonesty, many with fair industry and ability cannot gain a modest competence. Some are corrupted by the superfluity of their possessions, and others are dwarfed and embittered by privation. Children inherit the condition of their parents—the riches which they have not earned and the penury which they have not deserved. And as wealth is the most potent instrument of acquiring more wealth, these abuses and inequalities do not disappear. At some periods of history they have grown more and more grievous through a long lapse of years. At other periods, like our own, they are in process of abatement, but so slowly that ardent and enthusiastic reformers lose patience. It is easy, therefore, to understand the philosophical criticisms of the principle of private property which begin with the Republic of Plato if not earlier. And since the desires of man are unbounded and the return to his labour is commonly meagre, it is equally easy to understand how the arguments of students have found at times a powerful response in the passions of the multitude, and how, whenever old moral traditions have been shaken, or the heavy pressure of authority has been diminished, there begins a more or less disguised war against property. Yet the instinct of property is so deeply rooted in human nature, and the benefits of the institution are on the whole so great, that it has never wanted philosophical defenders. The communism of Plato was combated by Aristotle in a brief passage of the *Politics*, which contains many of the best arguments since used on that side of the controversy. Aristotle points out that what is common property is no man's care; that private property is inexpressibly sweet to man; that the abolition of private property, far from destroying selfishness, merely deprives men of the power of doing unselfish things. The Romans, an eminently practical and acquisitive people, were too busy in getting and spending to trouble themselves seriously as to the speculative grounds on which the acquisition of wealth could be justified. The Christians of the first age passed rapidly to the other extreme of feeling. They regarded this world simply as the thoroughfare to the next, and asceticism here as the best way of meriting bliss hereafter. They also felt a sincere and profound compassion for the poor and helpless, whose claims had

been but slenderly considered in the magnificent Roman empire. These feelings lost much of their intensity as the Christian church came to comprise a greater number of ordinary people, and finally became a state church to which all had to render outward submission. But the doctrines of the early Fathers were transmitted to the canonists (see CANON LAW; FATHERS, THE, THEIR ECONOMIC TEACHING AND INFLUENCE). They seem to have regarded community of goods as the ideal order of society, private property as a necessary evil of the actual world to be mitigated and atoned for by bountiful alms, trade as an occupation hardly compatible with the character of a devout Christian, and the receipt of interest for the use of money as altogether sinful. These principles could never be applied with logical severity. They could not even restrain the clergy from acquiring immense wealth. With the restoration of order in Europe the accumulation of riches began once more, and with the renaissance the spirit of enjoyment grew stronger. The ideas which pervaded the Canon Law became obsolete, and the theory of property was again considered without reference to theological prepossessions. In the philosophy of the 17th century the institution of property was justified upon grounds of a much more artificial character. HOBBS held that in the state of nature which preceded civil society, every man had an equal right to all things, *i.e.* to take what he could, but that this, like other natural rights, was surrendered at the making of the social compact, and that all subsequent rights of property owe their existence to the will of the civil power. The right of property would thus ultimately rest on the SOCIAL CONTRACT from which the civil power draws its authority. But the social contract is now admitted to be a mere philosophical figment for which there is no historical evidence. LOCKE argued that, since every man has a natural right to his own person, he has a natural right to the fruits of his labour, and on this argument he rests his defence of private property. But this justification would not extend to property which was not the result of the proprietor's labour. Even if we put aside the case of property obtained by gift or bequest, we shall find it impossible to say how much of the product in the complicated modern process of production is to be ascribed to the labour of any one of the persons employed. But worse still, to say that property in the work of our hands is sanctioned by the law of nature amounts only to telling us that it is just, not why it is just. J. J. ROUSSEAU in his *Social Contract* adopted a theory of property resembling that expounded by Locke. But in his later works he condemned the institution of private property altogether. Apparently he was led to this conclusion by his belief that all men are naturally good and reasonable, and if

left to themselves would easily and peaceably satisfy their simple wants. The savage state he believed to be one of virtue and happiness, and civilisation he regarded as the cause of evil and misery. Private property, at once the effect and the condition of civilisation, he therefore assailed as pernicious. Upon this theme he expressed himself with all his fervid eloquence, and he found a numerous public to sympathise with his declamations. A crowd of writers, inferior in genius but equally daring, helped to diffuse his doctrines. Their influence was distinctly felt in the French revolution. Rousseau is the inspirer of nearly all the anarchist and communist movements of the 19th century. Even the socialists, though they have dropped some of his first principles and have adopted some of the conclusions of modern science, have inherited no small portion of his spirit. Bentham justified private property on a more solid ground—on its expediency, or tendency to contribute to the greatest happiness of the greatest number. Property, he said, was a basis of expectation. The recognition of property enabled a man to project himself into the future and to work for remote ends, thus benefiting others as well as himself. The late Professor Green, in his *Principles of Political Obligation*, defends the institution of private property on the ground that it is necessary to the free development of the individual which is the common interest of society. This argument again rests on expediency—not in BENTHAM's sense of happiness but in the sense of the development of character in the citizen, who is assumed to be working for the common good.

It is on expediency again that the question to what extent certain special classes of undertakings, such as railways, waterworks, gas-works, drainage works, etc., ought to be the property of public bodies, is advocated. The advantages of holding by the MUNICIPALITY, and possible liberality of treatment of the inhabitants, are compared with the more economical management when the works remain private property.

The best argument for the institution of private property is the impossibility of finding any other principle to take its place. Self-interest is not, and should not be, the only motive to labour, but it is a motive which no experienced person will be ready to dispense with as unnecessary. A series of experiments, now extending over two thousand years, has shown that even voluntary communism, including only those who feel a vocation, is an unnatural state which cramps and at length deadens human energies. A compulsory communism embracing all the idle, the incapable, and the selfish would be a still more disastrous failure. At the present day the ideal of COMMUNISM (*q.v.*) has made way for that of SOCIAL-

ISM (*q.v.*). The socialist proposes to vest all the means of production in the state, and to render them henceforth incapable of private acquisition. All members of the community would receive either wages or a pension from the state, and this would remain their private property, which they might either spend or save at pleasure. Competition having come to an end, the scale of wages and pensions would be fixed by the state. Private property would thus continue to exist, although in an attenuated form. The criticisms brought against communism do not apply with equal force to socialism, but it may still be doubted whether any socialist scheme affords that scope to the instincts of enjoyment and accumulation which it is desirable that they should have. Under such a system no man could better his condition or transmit any advantages to his children. He could never feel secure that his condition would not suddenly be made worse by a vote of the majority. The affection with which the proprietor regards his own house or his own field would be impossible to one who could never by any chance be anything but a lodger and a day-labourer. The property of the socialist citizen, like that of the poorest class in our actual society, would hardly extend beyond the necessary food and clothes and furniture. That the distribution of wealth made by an average legislature would be really fairer than that which is now brought about by circumstances is extremely doubtful. That anything short of a permanent reign of terror would make energetic and ambitious natures acquiesce in it seems most unlikely. Such natures are in a minority and might be extirpated, but then what would become of progress and civilisation? But there is little fear of the final prevalence even of SOCIALISM. Revolutions may despoil one class to enrich another, but the victorious party is made up of human beings with passions like those of the vanquished. The French peasant to-day is certainly not less greedy of gain, nor less attached to his patrimony, than the French *seigneur* of three hundred years ago. On the other hand, the distribution of wealth may be improved without the abolition, total or partial, of private property. The improvement of law, the spread of education, the growth of co-operation, the accumulation of capital, and the fall of interest tend to raise the average of well-being and security. If this process be not interrupted by rash social experiments or fierce social convulsions, it may lead to the most beneficent results.

[For a discussion of the nature of the right of property, see Holland, *Jurisprudence*, pt. ii. ch. xi., and the authorities therein referred to; for the investigation of the early forms of property, see Maine's works, especially *Ancient Law* and *Village Communities in the East and West*.—Laveleye, *Propriété Primitive* (translated into

English as *Primitive Property* by Marriott, London, 1878; into German, under title of *Das Ureigenthum*, by Prof. Bücher, Leipzig, 1879), with instances as to holdings supplied by himself (see article on É. DE LAVELEYE.)—Fustel de Coulanges, *Origin of Property in Land*.—Seebohm, *English Village Community*.—Baden-Powell, *Land Tenures and Land Revenue Systems of British India and the Indian Village Community*.—On the theoretical grounds of right of property see Hobbes, *Leviathan*.—Locke, *Civil Government*.—Proudhon, *Système des Contradictions Économiques ou Philosophie de la Misère*, etc.—Rousseau, *Œuvres*.—Bentham, *Theory of Legislation* by Dumont.—Green, *Principles of Political Obligation*.—Duke of Argyll, *Unseen Foundations of Society*.—Bonar, *Philosophy and Political Economy*, and the literature of political philosophy and of socialism generally.]

VI. *Real and Personal Estate*.—The distinction between real estate and personal estate is the most important division of things in English law. It corresponds roughly to the division between things immovable and things movable in Roman law. But the correspondence is not exact. Real estate consists of lands, tenements, and hereditaments, but it does not comprise all interests in land. Thus, an estate for a term of years is personally whilst an estate for life is realty. This is due to the fact that estates for a term of years were hardly known at the time when the law of real property first took a definite shape. Moreover the progress of civilisation has produced new forms of property which can hardly be termed movable or immovable, and which have been included under the head of personal estate. Patents, trade marks, and copyrights are regarded as personality. Shares in a partnership or a joint-stock company are personal estate, however much land the partnership or the company may hold. When a sale of land has been agreed upon the land is regarded by the law as personality, whilst money which, by agreement, is to be laid out on land becomes realty. Thus there is no broad and clear distinction between real and personal estate. The origin of the distinction lies in a difference of procedure. Actions were formerly distinguished as real and personal. Real actions were those in which the very thing (*res*) in dispute could be recovered. Personal actions were those in which no more than pecuniary compensation could be obtained. But, practically, land was the only thing which could be recovered in kind, and so land became known as realty (see CHATTEL).

[See Williams, *Principles of the Law of Real and Personal Property*.—Digby, *History of the Law of Real Property*.—Markby, *Elements of Law*, §§ 128, 129.] F. C. M.

PROPERTY TAX. See TAXATION.

PROPIOS Y ARBITRIOS, the proceeds of local Spanish excises and rents derived from municipal pasture-lands and tenements, such

as inns and stalls in the markets. They were applied to the expenses of police, public instruction, and repair of bridges. They generally left a considerable surplus, which in times of need became an object of taxation by the state.

[Canga Argüelles, *Diccionario de Hacienda* (London, 1826).] E. CA.

PROPORTIONAL TAXATION. See TAXATION.

PROPRIETOR. See PROPERTY.

PROSPECTUS, the name for a notice calling the attention of the public to the issue of any stock or shares, or debentures or other securities. It is generally accompanied by a form of application for the use of persons who are willing to subscribe, and gives particulars as to the amount issued, the security offered, and other matters which intending subscribers may wish to know. If it is intended to apply for a quotation on the London stock exchange, the rules of that institution require the prospectus to be publicly advertised, and in the case of an issue of the shares or debentures of a limited company, they also require the company's memorandum of association to accompany the prospectus.

The persons under whose authority a prospectus is published are under general rules of law liable for fraudulent or recklessly untrue statements contained in the same, and if the prospectus refers to the shares or debentures of any company registered under the Companies Acts, the requirements of the Companies Act 1867, § 88, and the Directors' Liability Act 1890 (as to which see DIRECTORS, LEGAL DUTY OF), must be complied with. The responsibilities imposed by the first named act falls on the "promoters, directors, and officers of the company knowingly issuing" the prospectus, but the provisions of the Directors' Liability Act 1890 (see PROMOTER), with reference to prospectuses, affect a much larger circle of persons, viz. "every person who is a director of the company at the time of the issue of the prospectus or notice, and every person who, having authorised such naming of him, is named in the prospectus or notice as a director of the company . . . and every promoter of the company and every person who has authorised the issue of the prospectus or notice."

Some of the continental statutes make the issue of a prospectus, containing certain specified particulars, compulsory in certain events. Thus the Italian "Codice di Commercio," in the case of the public issue of shares in a company (§§ 129 and 130), requires a prospectus giving particulars as to the objects of the company, its capital, its memorandum of association, the share of profits reserved to promoters to be submitted to each subscriber for shares, and signed by him unless he signs the draft articles of the company, and in a similar way German company law requires the form of application, in which (in the case of an issue of shares not entirely taken over by the promoters of the company), intending shareholders subscribe, to contain a number of prescribed particulars concerning the formation and the constitution of the company (German Mercantile Code, § 209 c.).

The German Börsengesetz of 1896 makes a prospectus compulsory in the case of any issue of securities intended to be introduced on any German stock exchange, excepting, however, the government stock of the German empire and the German states, and provides, that any such prospectus must contain information sufficiently explicit to enable the public to form an opinion as to the value of the security offered for subscription; the same statute also provides that the authors of any such prospectus are to be liable for wilful or reckless misstatements, or wilful or reckless omissions (Börsengesetz, §§ 38 and 43). The discussions of, and the evidence taken by the imperial commission, on whose recommendation the statute in question was passed, were published and contain valuable information on the subject. E. S.

**PROTECTION, AND PROTECTIVE SYSTEM.** Like the opposed expression **FREE TRADE**, the word "protection" has acquired a somewhat narrow historical meaning. It is used to denote the policy of encouraging native industries by the use of bounties, or by the imposition of higher duties on foreign productions. Though in its essence the same as the older **MERCANTILE SYSTEM**, whose place it has occupied, its form is altered to suit the changed conditions of modern times, and to meet the criticisms passed on mercantilism by the school of **Adam Smith**. Protectionist writers lay less weight on the advantage of retaining the precious metals, and more on the benefits to production that are the outcome of their policy. Another new element is the higher value attached to future development in contrast with present gain. To build up great national industries even by the sacrifice of utility on the part of existing consumers, is regarded as the normal course in a well-managed state. The general tendency towards the extension of governmental activity furnishes an additional presumption in favour of the regulation of foreign trade in the interests of national industry. There are, in addition, special cases where the ordinary arguments for commercial liberty lose their force (see **FREE TRADE**), and these are embodied in the protectionist theory. Thus regarded, protection may be truly said to have existed for little more than a century. Its earliest effective appearance in a general statement is probably in the famous *Report on Manufactures* (1791) of the American statesman, **Alexander Hamilton**. For Europe, the wars accompanying the progress of the French revolution mark the starting-point of the modern protective system which was exemplified in the measures adopted by **Napoléon I.**

In common with all systems of economic policy, protection springs from a set of conditions, sentiments, and beliefs. Just as the mercantile doctrine naturally followed from the historic conditions and theoretic views of the 16th century, as **LAISSEZ-FAIRE** was the product of the doctrines and economic facts of

pre-revolutionary France, and the **MANCHESTER SCHOOL** arose from the circumstances and the economic theories of 19th-century England, so has the protective system been powerfully aided by continued warfare. The need for maintaining economic independence, the danger of an "invasion" of foreign goods, the "tribute" paid to foreign producers from whom goods are purchased—such are well-known protectionist pleas which show by their form that they have originated in a time of international conflict. But wider and deeper than this militant feeling is the sentiment of nationality. To exalt a particular country without reference to the interests of other nations is the avowed object of the system of protection. It claims, as in the title of **List's** work, to be the *national* system in contrast to the cosmopolitanism of the **Physiocrats** and **Adam Smith**. To the loyal citizen the promotion of native industry and economic interests seems a duty nearly as imperative as the defence of the national territory against invasion. Protection is thus one side or aspect of national sentiment, influenced indeed by a special bias.

The close affinity of the protective doctrine to the feeling of nationality is evidenced by the large intermixture of political considerations in the ablest arguments presented in its support. Some of the most plausible contentions of **Carey** and **List** are those in which the economic element is absent, or subordinate to the political one. The advantages of diversified industry, of husbanding national resources, or of maintaining certain industries that would disappear under **FREE TRADE** are not believed to be mainly economic. They belong rather to those higher parts of national life that the mere economist is supposed to neglect. "Protectionists"—as **J. S. Mill** has forcibly said—"often reason extremely ill, but it is an injustice to them to suppose that their protectionist creed rests on nothing superior to an economic blunder; many of them have been led to it much more by consideration for the higher interests of humanity than by purely economic reasons" (*Principles*, bk. v. ch. x. § 1).

But though patriotism is undoubtedly a contributory to the formation of the protectionist belief, it is more than doubtful whether it can justly be described as "enlightened." Many of the stock arguments in favour of restrictions on foreign trade show such an entire misconception of ordinary economic facts, and so completely distort the true proportions of things, that their acceptance is of itself conclusive proof of the widespread ignorance on which the ordinary protectionism rests for support. The **BALANCE OF TRADE** is still, in spite of innumerable refutations, referred to as an infallible test, and the necessary connection between imports and exports is totally ignored. That

"protection makes high wages" is a well-accredited article of popular belief in the United States, just as British protectionists imagine that "protective duties would increase employment."

Another influence which makes for protection is even less commendable. "Not only the prejudices of the public, but, what is much more unconquerable, the private interests of many individuals" (*Wealth of Nations*, bk. iv. ch. ii. 3rd par. from end), oppose the abandonment of protection. The special interests of certain classes of producers which are, as Adam Smith points out, "always in some respects different from, and even opposite to, that of the public" (*Wealth of Nations*, bk. i. ch. xi. last par.), have a great effect on the formation and retention of high tariffs. It is beyond dispute that the developments of protection during the last twenty-five years have been accompanied by persistent demands for aid on the part of industries alleging the pressure of foreign competition, which have in a great many cases been conceded by legislators.

The foregoing are the chief contributory influences to the formation of the system of protection, but additional force has been given to the last-mentioned by the remarkable revolution in methods of production, agencies of transport, and the level of prices that has taken place. As new countries are opened up, and older ones develop special branches of industry, competition becomes far keener and thus the weaker producers are gradually driven out. Cheaper carriage by both land and sea brings fresh competitors into the field, and diminishes the "natural protection" that formerly existed and led Adam Smith to conclude that "the free importation of foreign corn could very little affect the interest of the farmers of Great Britain" (*Wealth of Nations*, bk. iv. ch. ii.) Now, article after article, previously confined to home production, enters the list of imports, as illustrated for Great Britain in respect to beef and milk.

Tending in the same direction is the fall of gold prices (see BI-METALLISM), which temporarily encourages exports from countries using other standards, and causes producers to receive an apparently diminished reward. As the cry for protection by the state is the product of suffering, it is almost certain to grow in volume at a time of industrial and commercial depression.

There is, besides, on the part of the governments of the world a growing need for revenue. Public expenditure advances by leaps and bounds, as armies and navies are increased and the attributions of the state increase in number and weight. The means for supplying these enlarged demands are, however, limited. Direct taxation is felt at once, and is often highly unpopular. So are most excise duties. It is

therefore a relief to the harassed financier to find that a customs tariff with a strong protectionist element is regarded with approval by the people, while it brings in a considerable revenue. Fiscal considerations have helped in moulding French, German, American, and Colonial tariffs.

In seeking to estimate the real economic effects of the protective system it is well to begin by emphasising the general validity of the arguments for the opposite policy of FREE TRADE. It is unnecessary to repeat the statements given under that head, or to enumerate again the various exceptions made. As Prof. Nicholson well remarks, "these exceptions are simply part of the casuistry of economics; they are like the discussions by moral philosophers of the justification of occasional mendacity. Free trade like honesty still remains the best policy" (*Britannic Confederation*, p. 118).

The first result of the protective system is the increased cost of the articles that come under its operation. Duties on imported commodities, so far as they are really protective, narrow the market, and by partially excluding the most effective producers, raise the general cost of production. Protection to agriculture makes food dearer; if applied to manufactured articles it raises their value relatively to other things. Hence comes that injury to the consumer on which free traders have so often insisted.

Again, in a developed protective system, it is impossible to avoid placing burdens on producers. The line between "producers" and "consumers" wealth cannot be so marked off as to spare the former. The finished product of one industry is the "raw material" of another, while food, though "consumers' wealth," is an important element in the maintenance of a primary factor of production-labour. The more complex and highly organised the industrial system, the greater the tendency of protection to react injuriously on many forms of production. The assistance given to special industries is thus to a large extent counteracted by the increased cost of materials and of the means of subsistence.

These losses, which are serious in the case of protected industries that apparently gain by the system, become still graver when we pass on to forms of production not requiring artificial support. The great exporting industries obviously lose through protection, without any compensation; their development is checked, capital and labour are diverted to less profitable employments, and the whole national economy is lowered in efficiency. The great burden of restrictive duties falls on the staple industries of a country.

A further result of protection is its tendency to limit INTERNATIONAL TRADE. By checking

imports it checks exports, and reduces the benefits derived from exchange. More especially is this true in regard to competition in neutral markets. A country with a higher level of cost, and hindered in exchanging, is unable to meet another country with lower cost and less restrictive regulations.

The actual arrangement of a protective system is an additional cause of difficulty. A scientific system of protection—such as that contemplated by HAMILTON or LIST—would involve the most refined and difficult considerations. Not only the present situation, but the future prospects of the multifarious industries of the nation, have to be duly weighed in the balance, and assistance distributed in proportion to their ascertained merits. Existing tariffs in no way satisfy these rigorous conditions. Adopted in haste and under the pressure of particular interests, they fail to satisfy even intelligent protectionists, and justify Prof. Sidgwick's assertion "that protection, as actually applied under the play of political forces, is sure to foster many weak industries that have no chance of living without artificial support, and to hamper industries that might thrive independently by the artificial dearthness of some of their materials and instruments; so that it turns out a dangerous and clumsy, as well as costly, instrument of industrial competition" (*Stat. Journal*, vol. xlviii. p. 602).

As minor results of protection the greater difficulties of fiscal administration and the loss incurred through the encouragement given to smuggling, may be noticed. But the closer connection between politics and industry is a greater evil. When immense monetary interests depend on the course of legislation, the risk of corruption in political life is increased, and producers are trained to watch and guide for their own interest the measures submitted to the legislature. If protectionists appeal to political more than to economic arguments, it by no means follows that even on political grounds their case is a strong one.

Regarded from the strictly national standpoint, the protective policy appears to be mistaken, not in its aim,—that of advancing national industrial life,—but in the methods by which it seeks to attain it. Viewed in relation to the interests of the world as a whole, its evil consequences are more readily apprehended. Granting that advantages are obtained by a nation in the growth of young industries, the transfer of labour and capital to its territory, or by the sacrifices imposed on foreign producers, it follows that its gains are made at the loss, and more than equivalent loss, of other countries. "International utilitarianism" would therefore suggest the abandonment of the system.

Protective Duties are the chief expedient by which protection has been carried out, but in certain cases where they cannot be used, the

method of BOUNTIES has been substituted (see also BOUNTIES ON SUGAR). Though having the same general tendency, a bounty is less likely to be carried to the same extent, as its cost is more readily perceived and more keenly felt. NAVIGATION LAWS may also be noticed as an important protectionist expedient, though for the most part they operate either as duties or bounties.

Some protectionist writers object to confining the idea of protection to the case of foreign trade. They prefer to regard it as "the proper attitude of government towards the industrial development of a nation" (W. D. Lewis, art. "Protection," *Chambers's Encyclopedia*, vol. viii. p. 444). Employed in this wider sense, protection has points of connection with state socialism (see SOCIALISM, STATE), and also with paternal government (see also POLICE), but this use of the term is too wide and vague to be of any service. At present most civilised states have adopted protection. In fact Great Britain, with its dependency India, and the important self-governing colony of New South Wales, are the chief examples of pure free-trading communities. Belgium, Holland, Denmark, and, till recently, Switzerland have such low tariffs that relatively to other states they may be regarded as free trade in policy.

[The works given under FREE TRADE will also serve here. Amongst protectionist writings the most important are:—A. Hamilton, *Report on Manufactures, Collected Works* (ed. Lodge), vol. ii.; also in *State Papers and Speeches on the Tariff* (ed. Taussig).—F. List, *Das nationale System* (trans. S. Lloyd, 1885; New ed. 1904).—H. C. Carey, *Social Science*, 3 vols. 1858-9.—R. E. Thompson, *Protection to Home Industry*, 1886.—S. N. Patten, *The Economic Basis of Protection*, 1890.—See also U. Rabbeno, *Protezionismo Americano*, 1893 (translated 1895).—W. Roscher, *System*, vol. iii. pt. ii. ch. vi., sketches the history of the protective system.] C. F. B.

PROTEST (of Bills). A protest is a formal certificate drawn up by a notary public, to attest some fact, as for instance the dishonour of a bill of exchange. In continental countries all dishonoured bills must be protested. English law seems to have adopted the rule as a matter of comity. When a foreign bill is dishonoured in the United Kingdom it must be protested in order to preserve the holder's right of recourse against the drawer and endorsers, but protest is unnecessary as against the acceptor. A foreign note need not be protested. Protest is also required as a preliminary to acceptance or payment for honour of any dishonoured bill whether inland or foreign. Provision is now made by the Bills of Exchange Act 1882, § 94, that when the services of a notary are not available, a dishonoured bill may be protested by any householder in the presence of two witnesses.

[Bytes on *Bills of Exchange*, 15th ed., and Chalmers on *Bills of Exchange*, 4th ed., tit. protest (see NOTING OF BILLS).] M. D. C.

PROUDHON, JOSEPH (1809-1865), born at Besançon, came of a very poor family—his father was a cooper, his mother a cook; he worked as a compositor in a printer's office till he was thirty years old. Thus he was a self-taught man, but the trade he followed supplied him with the opportunity of reading and of self-instruction.

He published early several papers which were much noticed, one especially, in 1839, on the advantage of the observance of Sunday, which is still frequently quoted. But it was particularly his famous pamphlet *Qu'est-ce que la Propriété?* published in 1840, which secured him fame and election as deputy to the Constituent Assembly during the revolution of 1848, at the same time involving him in a lawsuit.

He was one of the most prominent and most dreaded opponents of the *bourgeois* during this revolutionary period, the greater part of which, three years, he passed in prison. He did not, however, oppose the second empire, and after the accession of Napoléon III. he gave up politics and followed the quiet life of the middle class till the end of his days.

His complete works consist of thirty-seven volumes, without counting fourteen volumes of correspondence. He wrote his books like his newspaper articles, with great rapidity, discussing everything and anything, with an absence of method and a disdain for order which makes the reading of his works more difficult perhaps even for his fellow-countrymen than for foreigners. Hence he is but little read. He loved dialectic, and to play with ideas like a juggler who rattles and clashes the most incongruous things together. He loved clap-trap expressions, "Property is theft," and "God is evil," but in reality he admitted the lawfulness of property and the existence of God.

A self-styled disciple of Hegel—though it was by no means clear that he really understood that author,—he had raised contradiction to the level of a principle, continually setting forth thesis and antithesis but rarely synthesis.

A violent and often unfair controversialist, he largely unsettled accepted and established opinion, but notwithstanding his proud motto *destruam et edificabo*, he constructed nothing, he left behind him neither definite programme nor school, properly so called.

Proudhon is generally classed among socialists on account of his attacks against landed property and interest. But as a matter of fact he criticised socialist doctrines with as much violence as orthodox doctrines. Neither was he a communist, since he called their doctrines—"the religion of misery," the "emulation of slothfulness,"—"a social bugbear." 'La

communauté est encore le vol! Entre la propriété et la communauté, je construirai un monde!" (*Organisation du Crédit*, in fine). Nor was he a state socialist, since he said that the madness of appealing to the state was the "leprosy of the French mind." If a name must be given to his doctrine, it would be "anarchy." Moreover it was he who used this word for the first time (or rather, the two words *anarchie*) as expressing, not disorder and chaos, but, on the contrary, the highest and most perfect form of social organisation. "Although a friend to order, I am, in every sense, anarchist" (*Qu'est-ce que la propriété?* 1st mémoire, ch. v.). Besides, he said, "The real form of government is anarchical" (*Les confessions d'un Révolutionnaire*, p. 122).

However, the small number of socialists who still consider themselves his disciples do not term themselves anarchists, but *mutualists*. They understand by this—and indeed it was their master's view—that society ought to be founded on *equality* and *reciprocity* of the services rendered, whilst the actual social system is only founded on the *subordination* of services. It is to this that social justice is reduced, which he opposes to the old watchword "Fraternity"—dear to the Utopian socialist. "It is not without reason that the popular imagination has provided justice with the balances. Justice, in fact, applied to economy is nothing but a perpetual balance, or, to express myself still more exactly, justice is nothing but the obligation imposed on all citizens and all states in their relations of mutual interest, to conform to the law of equilibrium. . . . The economist maintains that he has no ground whatever on which to intervene in the determination of this equilibrium, and that the beam must be allowed to oscillate after its own way. The idea of supporting it is absurd."

But how was this ideal of the reciprocity of services to be attained? Proudhon flattered himself that he had realised it by establishing a *Banque d'Échange*<sup>1</sup> (see LABOUR EXCHANGE; OWEN, ROBT.).

<sup>1</sup> The object of the *Banque d'Échange* was explained by Proudhon thus: (1) "to secure to every member of Society, without the interposition of money, all produce, commodities, merchandise, services or labour; (2) subsequently to procure the reorganisation of agricultural and industrial labour by changing the condition of the producer." Hence Proudhon's institution must not be confounded with OWEN's "Equitable Labour Exchange," although it also aimed at bringing producer and consumer into direct relation with each other, and at the suppression of intermediaries, of parasitical deductions and charges, and of money. But though Proudhon's *Banque d'Échange* was to receive all the produce and merchandise to it, it issued, not labour notes, but bank notes, on the security of the produce deposited, which was exchanged for equal value. But Proudhon, no more than Owen, foresaw that in consequence of the inconsidered multiplication of these products, the security would become valueless. (This system may be compared with the views on *Compatibilisme Social* set forth by MM. Solvay and Hector Denis in the *Annales de l'Institut des Sciences Sociales* of Brussels, 1896).

As a matter of fact he realised his idea by the establishment of the *Banque du peuple* in 1849, which naturally failed miserably.

In spite of his noisy attacks against property, his aim was not the suppression but the "universalisation" of property. "We desire," he said, "that every one should have property. We wish for property without usury, because usury is the stumbling-block to the growth and to the universalisation of property" (*Journal Le Peuple*, 2nd September 1849).

Thus it is not the abolition of property, but the abolition of interest, the *gratuitousness of credit* which is to him "the pivot of socialism." "Le problème économique n'est autre que le problème de la centralisation et de la gratuité du crédit d'après le principe de l'échange direct et mutuel" (*Banque d'Échange*). Hence Proudhon has been justly reproached with having strangely narrowed the social problem by reducing it to a mere reform in banking. On this question of the *gratuité du crédit* he was engaged in a long controversy with BASTIAT, published in Bastiat's works. Proudhon, admitting the lawfulness of interest in so far as the historical category, as the Germans say, strives to show that interest should become useless by the creation of his *Banque d'Échange*, which would procure for all, if not property, at least the free use of the implements of labour. And Bastiat scarcely cared to reply to him that his *banque* would do business with nothing but paper-money.

Of the enormous work of this indefatigable labourer, there remains only a stock of scattered ideas here and there, some deep, others incoherent, many contradictory, but in which nevertheless the economist and the socialist can find something valuable. It may be questioned what COLLECTIVISM, and in particular what KARL MARX, owed to Proudhon. Karl Marx detested Proudhon, and took him violently to task in the pamphlet *Misère de la Philosophie*, in reply to Proudhon's book *Les Contradictions Économiques* the second title of which was *Philosophie de la Misère*. He said of him "he is only an insignificant bourgeois oscillating continually between capital and labour, between political economy and communism." And in fact it does not seem that there was any connection between the extreme individualism of Proudhon and the collectivism of the German socialist. Proudhon supposes that in our economic organisation value is not proportional, as it ought to be, to labour, and that the social problem consists in making it such, while Karl Marx, on the contrary, maintains that value is necessarily proportional to labour, and that on this is founded capitalist exploitation, while the capitalist prevents equitable distribution.

The complete works of Proudhon have been published; édition Lacroix. The following are the principal:—*De la célébration du Dimanche*,

*considérée sous les rapports de l'hygiène publique, de la morale des relations de famille et de cité*, 1839.—*Qu'est-ce que la propriété?* 1840. This is the famous "Mémoire" that made his reputation. It was followed by two other "mémoires" published 1841 and 1842, and one, *Théorie de la Propriété*, published after his death in 1866, but these are far less interesting.—*Système des contradictions économiques ou Philosophie de la Misère*, 1846, 2 vols. It was the title of this book that appeared to suggest to Bastiat his work *Harmonies Économiques*.—*La Justice dans la Révolution et dans l'Église*, 6 vols. 1858.

[The most recent critical works on the life and doctrine of Proudhon are: Sainte Beuve, *Proudhon, sa vie et sa correspondance*.—Karl Diehl, *Proudhon, seine Lehre und sein Leben*, 1888-1890.—Müllberge, *Studien über Proudhon*, 1891.—Desjardins, *Proudhon*, 2 vols. 1896.—Bourguin, article "Des rapports entre Proudhon et Karl Marx," in the *Revue d'Économie Politique*, March 1893, and also the violent and abusive, though sometimes true, criticism by Karl Marx in 1847 in French, and re-published in 1896, *La Misère de la Philosophie*, written in reply to Proudhon's *Philosophie de la Misère*.] C. G.

PROVABLE DEBT. On bankruptcy the whole of the debtor's estate vests in his trustee for the benefit of his creditors. A creditor is a person who has a debt or demand provable in the bankruptcy. The general rule is that "the privileges of creditors to come in under a bankruptcy, and of bankrupts to be discharged, are co-extensive and commensurate." This rule was laid down by Lord Hardwicke in 1736, and it is still the guiding principle of the Bankruptcy Act 1883. Section 37 of that act defines what debts are provable. It first provides that "demands in the nature of unliquidated damages, arising otherwise than by reason of a contract promise or breach of trust, shall not be provable." The object of this provision is to exclude claims for torts or wrongs, for instance libel or assault. But if judgment has been obtained in an action for a wrong, the claim for this wrong is merged in the judgment debt, which is provable like any other debt. The section then proceeds to exclude debts contracted after notice that the debtor has committed an available act of bankruptcy, and to provide that "except as aforesaid all debts and liabilities, present or future, certain or contingent," to which the debtor is subject at the date of the receiving order, shall be provable. A proof of debt must be verified by affidavit in the prescribed form. M. D. C.

PROVISORS, STATUTE OF. In the reign of Henry III. great indignation was excited by the claim advanced by the popes to issue *provisions* by which they appointed to English livings. The support of the king enabled the popes to make good their claim, and a large proportion of benefices were by this means conferred upon foreigners. This was a serious diminution of the patronage enjoyed both by

bishops and laymen. In the 14th century the papacy ventured to extend its provisions to the filling up of bishoprics as well as benefices. The anger roused by this foreign intervention was increased by the fact that at this time the popes were resident at Avignon and were thus under the influence of France, while England was at war with that country. For some time the English kings connived at the exercise of papal patronage, because it enabled them to defeat the chapter's right of election. But at last public opinion found expression in the Statute of Provisors, which was passed in 1351 and renewed in 1390. By this statute papal provisions were forbidden, and persons receiving them were liable to imprisonment. If the pope infringes on the rights of clerical patrons, the latter are to insist on exercising their power of appointment, and if they fail to do so, the presentation lapses to the king. In the case of a lay patron, if he fails to present within six months, his right lapses to the bishop, and if the bishop fails to appoint within a further month, the king is to make the presentation.

[Stubbs, *Constitutional History*, vol. iii, pp. 310-36.—Makower, *Constitutional History of the English Church*; the statute is printed in full in app. viii.] R. L.

**PROXY.** The term proxy is used in two senses. First it denotes a person who represents another for voting purposes, and secondly, it denotes the instrument by which the authority to represent is conferred. An instrument of proxy may be either general or special. A general proxy authorises the person who holds it to exercise his discretion throughout in the matter to which it relates, whereas a special proxy only authorises him to vote for or against some specific resolution or proposal. Under the Bankruptcy Act of 1869 the system of general proxies gave rise to gross abuses, which were investigated by a select committee of the House of Commons in 1880. The committee recommended that no proxy should be used unless it expressed in writing the particular purpose for which it was given. The Bankruptcy Acts of 1883 and 1890 do not go so far as this, but they put considerable restrictions on the use of general proxies in bankruptcy matters.

[See Bankruptcy Act 1883, sched. i., and Bankruptcy Act 1890, § 22.] M. D. C.

**PRUD' HOMMES (Fr.).** Councils for conciliation and arbitration in disputes between masters and workmen, instituted by a law of 1806. These bodies are authorised by a decree of the ministers of commerce and justices in industrial centres, on a demand by the municipal council approved by the chamber of commerce. They are permanent and elective, and must consist of at least six members. When the local industry comprises only a small number of trades, each branch elects two members, one a master the other a workman.

When the number of branches of industry is large, they are grouped into classes for the election of members. The members serve for six years; one half retiring every three years, but they are re-eligible. The president and vice-president are elected annually. If the president is a master, the vice-president must be a workman, and *vice versa*. The masters act gratuitously. The workmen may receive attendance fees, paid from the municipal funds, as are also all the expenses of the councils. Each council has a special bureau of two members, and a general bureau of all the members. The special bureau is charged to endeavour to conciliate the parties; if not successful they are sent before the general bureau. The judgment given is final for all disputes in which the question at issue does not exceed a sum of 200 f. (say £8). Above that sum there is a right of appeal to the tribunal of commerce. The qualification of *prud' hommes* is the age of twenty-five and five years' exercise of the trade. Jurisdiction only extends to trades which elect members, and which are named in the decree instituting the council. The councils are competent to judge contestations between members of workmen's associations, between masters relative to trade marks, models, and designs, and in matters relating to apprenticeship. Should one of the parties not appear, judgment is given by default, and can only be set aside by appeal to the tribunal of commerce. The councils have power to condemn disorderly workmen and insubordinate apprentices to imprisonment not exceeding three days. A law of a more general character was passed in December 1892 to meet the case of disputes between masters and collective bodies of workmen, and strikes, which were not provided for by the law on *Prud' hommes* (see CONCILIATION, BOARDS OF; CONSEILS DE PRUD'HOMMES). T. L.

**PTOLEMY OF LUCCA** (1236-1327), a Dominican scholar, in later life bishop of Torcelli, was very possibly the real author of the greater part of the treatise *De Regimine Principum*, commonly attributed to St. Thomas AQUINAS.

The portions of the work especially interesting to the economist are l. ii. c. 3, on the state's food supply; cc. 5-7, on natural and artificial riches; c. 13, on the currency; c. 14, on weights and measures; c. 15, on the relief of the poor from the public treasury; and l. iv. cc. 4-6, on the Platonic communism. Concerning the currency, it is remarked that "the prince or king ought to be moderate in changing or diminishing the weight or the metal, since this turns to the detriment of the people, inasmuch as money is a measure of things; so that to change the coinage is just the same as to change a weight." [As to the place of this teaching in the history of the doctrine of currency, see W. Endemann, *Studien in der romanisch-kanonistischen Wirtschafts- und Rechtslehre*, ii. (1883) 163, 187. Bibliographical

indications and the most recent discussion of the authorship of the treatise will be found in the dissertation of C. A. Bosone (*Der Aufsatz*) on the Essay *De Regimine Principum*, Bonn, 1894, which maintains that the whole of it is substantially the work of AQUINAS (*q.v.*). It undoubtedly represents his teaching if it does not come from his hand.] W. J. A.

PUBLIC ADMINISTRATION. See ADMINISTRATION.

PUBLIC ASSISTANCE. The phrase "public assistance," is a literal translation of the French *Assistance Publique*, which roughly corresponds to our POOR LAW (*q.v.*) But certain differences both of principle and detail may be noticed in the relief of the poor in the two countries. In France the right to relief is not recognised, nor is the distinction between POVERTY (*q.v.*) and destitution. As a logical consequence there is no poor-rate, in the sense in which in this country the overseers of the poor are compelled by law to raise as much for the relief of the poor as that relief demands. The relief given in France is therefore limited to the sums available for the purpose, which are raised in several ways, by private subscriptions, by bequest, by a tax on amusements, viz. the tickets of places of public entertainment, and endowments. Thus in France the organ of poor relief corresponds more to a charity organisation society administered by a local authority than to our poor-law system. In each commune theoretically, and practically in the great majority of communes, a *Bureau de Bienfaisance* is established, presided over by the mayor and a council elected locally. This body distributes the funds at its disposal, but is limited to those funds. Hence we find great inequalities between communes as to the sum available annually for the relief of the poor, and a tendency to spread the funds over as wide an area as possible, with the result that the relief given is often to our minds wholly inadequate. The relief of foundlings (*Enfants Trouvés*), deserted children, vagrants, and the sick, is organised in great detail, but a specific or historical treatment of the subject would take us too far. L. R. P.

PUBLIC LOANS. See DEBTS, PUBLIC.

PUBLIC POLICY. English courts have always refused to enforce contracts which they regard as contrary to public policy; but the test of what is or is not opposed to public policy has naturally varied as the conditions of society have changed. As our law is uncodified, and as the judges are technically bound by the decisions of their predecessors, we find them continually engaged in the task of putting new wine into old bottles. The modern tendency is to restrict the doctrine of public policy within narrow limits, and to confine its operation to agreements which are tainted with criminality or are *contra bonos*

*mores*. As Justice Cave said in a recent case, this is "a branch of the law which certainly should not be extended, as judges are more to be trusted as interpreters of the law than as expounders of what is called public policy." Commerce is left to take care of itself, and contracts are enforced without regard to the opinion of lawyers as to what may be for the advantage of trade in general. The old rules as to contracts in restraint of trade have been watered down. Trades unions, which were regarded as illegal combinations in restraint of trade, have received legislative recognition, and apart from fraud full play is allowed to the competition either of individuals or of combinations to keep up prices.

[See the whole question discussed in a recent House of Lords case, *Mogul Steamship Co. v. M'Gregor* (1892) A. C. 25].

See PERPETUITIES; RESTRAINT OF TRADE; THELLUSON, P.; TRADES UNIONS. M. D. C.

PUBLICANI. The name given to the capitalists who farmed the revenues of the Roman state. Down to the fall of the republic Rome hardly possessed the rudiments of a permanent civil service, and was therefore without proper machinery for collecting the varied revenues of her extensive possessions. This work was done by wealthy individuals who combined in companies or syndicates, and farmed mines, salt-works, fisheries, etc., belonging to the state, as well as certain indirect revenues such as the *portoria* or harbour dues. When transmarine provinces were acquired, the same method was employed to collect the land-tax imposed upon them. The system reached its greatest and most pernicious extension when C. Gracchus (B.C. 121), applied it to the revenues of "Asia," by far the richest of the Roman provinces. From that time till the establishment of the empire the *Publicani* filled a great space in the history of Rome, partly as the means whereby the provinces were impoverished and the capital flooded with ill-gotten wealth, and partly as a force in the internal politics of the ruling community, generally hostile to the senate, which made feeble attempts to check their oppression, and therefore inclining to an alliance with the popular party, but never really attached to any principle, and aiming solely at the accumulation of money. With the establishment of the empire and the reform of the administration, the scope for the activity of the *Publicani* was reduced. The provincial land-tax was collected by public officials, and, with regard to those branches of the revenue which continued to be farmed, a closer and more severe supervision was exercised by the government. The publicans so often referred to in the New Testament were not the Roman capitalists but their underlings, usually natives of the subject provinces, and therefore even more hateful to

their countrymen (as to the *Societates Publicanorum*, see PARTNERSHIP, considered historically).

[Smith's *Dictionary of Antiquities*; Mommsen and Marquardt, *Handbuch der Römischen Alterthumswissenschaft*, and the authorities therein cited.] F. C. M.

PUFENDORF, SAMUEL (1682-1694), studied law in Leipzig and Jena, and lectured at Heidelberg from 1661 to 1670, when he left Germany for a professorship at the Swedish university of Lund. In 1686 he was appointed privy councillor and royal historiographer of Sweden; two years later he was called to Berlin by the Great Elector (Frederick William, 1620-1688), who bestowed on him similar titles and dignities.

His *De Statu imperii germanici liber unus*, Geneva (real imprint the Hague), 1667, republished in German in 1870 (in the *Historisch-Politische Bibliothek*), may have led to his leaving Germany, for, though issued under the fictitious name of Severinus de Mozambano, it was known that Pufendorf was the author of this critical but faithful picture of the state of helplessness of the German empire, and of the misgovernment prevalent in most German states since the Thirty Years' War.

The publication of his former work, the *Elementa jurisprudentiæ universalis* (1660), had already attracted public attention and led to his appointment at the university of Heidelberg; it is the first attempt to found the philosophy of law on a purely rational basis, and may be considered as the origin of his celebrated treatise *De Jure naturæ et gentium libri VIII.*, published at Lund, 1672 (another edition at Amsterdam, 1704, with the author's emendations, since often republished, and translated into most European languages).

In state questions, Pufendorf upholds the principles maintained by the founders of the Prussian monarchy, commencing with his protector Frederick William, the Great Elector. The individual will must be subject to the will of the collective or individual possessor of supreme power (*summum imperium*), who is the interpreter of the nation considered as a moral body, and is to decide what is lawful and what is not; in this respect, Pufendorf follows the teaching of HOBBS, limiting, however, the authority of the supreme power to what the citizens have acquired under its protection. Practically the state, thus possessed of the *dominium emensens* (see EMINENT DOMAIN), regulates the disposal of private fortunes, —sumptuary laws, successorial laws, etc.—and the levying of taxation; its duty is to foster the economic development of its subjects, especially in agriculture, manufactures, trade, and navigation. Pufendorf is not a thorough-going opponent of MONOPOLIES (*q.v.*), and would allow the privileges of corporations and crafts to continue. The only limitations to the fiscal prerogative of government are that it must never act as a dissolute or weak head of the family; first of all, export duties must never impede the prosperity of trade, for "a port which traders desert is a sterile port."

Taxation should always be proportioned to the means of the taxpayer.

On the purely economic domain, Pufendorf is not carried away by the passion for the indefinite expansion of population, so general among German cameralists (see CAMERALISTIC SCIENCE) of the last two centuries. He considers that the question whether property should be individual or collective depends on the stage of progress reached by the nation, for history shows that collective property is the most natural and advantageous system for barbarians. Equal division among the children of the same father is not naturally necessary; account ought to be taken of the existence of the family taken as a whole; according to each case, the practice of MAJORAT or MINORAT (*q.v.*) may be recommended.

Pufendorf's theory of prices has been highly praised. It comprises the vulgar price, *pretium vulgare*, founded on the fitness of things to satisfy human wants, and the *pretium emensens* or price expressed in terms of money; Pufendorf thus announces the distinction between VALUE IN USE (*q.v.*) and value in exchange (see EXCHANGE, VALUE IN), and classifies economic goods as—things, *res*, services, *opera*, and obligations, *actiones*. Scarcity is the most important factor of high prices, but value in exchange is often unconnected with value in use. As to expenses of production, those only which are usual, influence prices, which also experience the influence of a scarcity or abundance of the currency. He, however, rather exaggerates the action of law when he states that the use of precious metals as money, is not so much derived from their natural adequacy, as from a convention among men. The value of land, considered as naturally stable, shows if a general rise of prices is to be ascribed to a scarcity of money or to a scarcity of goods. His theory of usury follows a *via media* between the absolute rejection and the absolute liberty of interest; according to Pufendorf, it is a mistake to believe that the taking of interest is forbidden by the Bible. Moses actually sanctioned it by allowing Jews to take interest from foreigners.

PURVEYANCE. One of the oldest prerogatives of the crown, not only in England but in most European countries, was the right to demand supplies and services at the lowest prices, which were usually fixed by the royal

officers. Payments were not made, as a rule, in money, but in TALLIES (*q.v.*), which entitled the recipients to deduct the specified sums from their future taxes. Not infrequently payment was evaded altogether. Little is known of the early history of these exactions, but in the 13th and 14th centuries they gave rise to such glaring abuses that the petitions and laws on the subject are extremely numerous. From *Magna Carta* (arts. 28-31) we learn that royal constables and bailiffs were in the habit of exacting purveyance, and this practice is forbidden. In the *Articuli super cartis* of 1300 it is provided that goods are only to be taken for the king and his household, and then only at a price agreed with the owner; undue exactions are to be punished with dismissal and imprisonment. But legislation seemed impotent to check the extortions of royal officials; under Edward II. the complaints are as loud as ever, and the ordinances of 1311 went so far as to forbid purveyance altogether. But the ordinances were formally repealed by the parliament of 1322, in which the law of 1300 was re-enacted. Still the abuses continue to be the subject of innumerable petitions under Edward III., in whose reign no less than ten statutes were passed on the subject. The most important of these is the statute of 1362, which provided that purveyance is to be limited henceforth to the personal wants of the king and queen, whereas it had frequently been exacted for other members of the royal family and their servants. At the same time the hated name of purveyors is changed for that of buyers. This law seems to have been far more efficacious than any of its predecessors, and the subject retires into the background until the 17th century. Under James I. we have a petition of the Commons in 1604, which shows that many of the old abuses were still rife. It is stated that the royal officials, when 200 carts are required, will order 800 or 900, in order that the owners may bribe them to withdraw the demand. Goods were valued by strangers called in by the purveyors, and owners were often unable to obtain more than a fraction of the value. Suitors who complained of illegal usage found it impossible to obtain justice against the agents of the crown. The result of these complaints was a proposal in the Lords that the king should surrender the right of purveyance for an annual grant of £50,000, but nothing came of it. In 1610 Cecil nearly succeeded in carrying through the "Great Contract," by which purveyance and the feudal rights of the crown were to be abolished in return for a fixed revenue, but subsequent disagreement between the crown and the Commons led to the abandonment of the scheme. Thus purveyance lasted till the great rebellion, and perished with the defeat of the king. In 1660 it was formally abolished (see PRISAGE).

PUT AND CALL. Speculation in stock exchange securities, bullion, and produce, is, to a large extent, carried on by means of OPTIONS (see also CALL). Such options are either single options ("call" or "put") or double options ("put and call"). A speculator is said to "give for the call" if he agrees to pay a specified percentage, and in return obtains the privilege to decide at a specified point of time whether he will purchase a specified amount of stock, bullion, or produce at a specified price; he is said to "give for the put" if in the same manner he secures the option of selling such stock, bullion, or produce. Thus for instance a speculator who gives  $\frac{1}{4}$  per cent for the call of £10,000 consols at 112 at the end of December, can at the end of December, at his own choice, either call for £10,000 consols to be delivered to him at 112 $\frac{1}{4}$  or pay £25 without calling for the consols. A speculator is, on the other hand, said to give for the "put and call" if, at the specified time, he is to become entitled at his option either to buy or to sell at the specified price.

The amount of the percentage payable for the privilege of exercising an option depends on the length of time, the nature of the security or article, and the general situation and prospects. Options in securities or articles, in which there is much speculation, have a regular market value, and—on account of reasons which it would take too long to explain—the market value of a double option is always equal to the double amount of the market value of the corresponding single option. Thus in the above-quoted example the "put and call" of the £10,000 consols at 112 for end of December would cost  $\frac{1}{2}$  per cent. The speculator who sells the option, who in stock exchange language is said to "take" for the "call," or the "put," or the "put and call," reckons on the steadiness of prices, whilst the purchaser of the option speculates on fluctuations. If he believes in a change in one direction only, he will give for "a single option," but if he anticipates fluctuations without being able to form an opinion as to their direction, he will "give for" a "put and call." There are many circumstances, imaginable, under which a change in the range of prices may be expected within a given time, but subject to great uncertainty as to the direction of the change. Thus, for instance, a political decision of great importance may be expected by a certain date, and it may be thought that if the decision is taken one way it will lead to a heavy fall of prices, whilst an important rise would ensue if it were taken the other way. Under such circumstances the possibility of being able at one's option either to call or put at the present price, at the time when it is anticipated that

the uncertainty will be over, may of course be worth a great deal more than the amount of the option money. Thus in the example given above, a speculator who is able at the time of the option, becoming exercisable as before, to sell the consols at 114, will call them at 112, and, after paying  $\frac{1}{2}$  per cent option money, and  $\frac{1}{2}$  per cent brokerage, realise a net profit of  $1\frac{1}{2}$  per cent, and he will obtain the same profit, if consols, instead of rising to 114, recede to 110.

In actual practice option transactions are generally more complex, being used to assist or serve as insurances for other operations, or being made the basis of a series of successive speculations; but this fact in no way affects the general principles of options, which may be stated as follows: the speculator who sells the option has an unlimited risk of loss, and cannot gain more than the option money, whilst the purchaser of the option cannot lose more than the option money and the brokerage, and has an unlimited chance of profit. This limitation of risk on one side creates the impression that option business is a safer and therefore sounder mode of speculation than other speculative business, but this view is based on an obvious fallacy. As already mentioned, the purchaser's comparative safety is counterbalanced by the seller's corresponding danger, but even from the purchaser's point of view the dealings in options are more in the nature of gambling transactions than ordinary speculative purchases or sales. Whilst in the case of an ordinary speculation the result may be favourable in the end, although at first there is an apparent loss; the result of the option is final at the same date as the time for declaring the purchaser's choice has come. If the option cannot be exercised the amount at stake is irretrievably lost. The fact that the loss is limited induces the purchaser to speculate in a much larger amount than he could afford to do if there was an unlimited risk, and therefore materially increases the total amount of speculative purchases and sales. Moreover, imprudence in option dealings is increased by the circumstance that, whilst speculators generally are compelled to pay the difference between the original price and the market price, or between the last market price and the present market price, as the case may be, at each successive account day, if such difference is against them, and must therefore have liquid means at their

command, option dealers are not required to pay any differences until the time for declaring the option has arrived. These facts are sufficient to show that recklessness in stock exchange transactions is much increased by the system of options.

R. S.

#### See OPTIONS; POLEGRAPHY.

[For an interesting description of the stock exchange operations known as option dealing, see L. R. Higgins, *Put and Call*, Eppingham Wilson, 1896.]

PYX, from *πυξίς*, a box, is properly the pyx-chest at the mint into which one coin from every 15 lbs. of newly coined gold, or 60 lbs. of silver, is put to await the *Trial of the Pyx* (see PYX, TRIAL OF). In addition to its ecclesiastical use, the word is also applied to the box in the chapel of the pyx, Westminster Abbey, in which the standard plates of gold and silver used at the trial are kept by the warden of the standards (see STANDARDS, WARDEN OF).

R. H.

PYX, TRIAL OF, the now annual testing of coins from the pyx-chest at the mint. These and pieces from the trial plates (see PYX) are assayed by cupellation by a jury of the Goldsmith's company. The permissible variation or "remedy" is now 2 parts in 1000 of gold, of silver 4; but the difference is usually much less. By weight the "remedies" are respectively 1·6 and 4·17 in 1000. The 27 *combustiones* in the pipe roll of 11 Hen. II. show a rough mode of trial adapted to an age in which mints were numerous, but the *blancum* [*argentum*] of Domesday denotes its equivalent much earlier. Both tested coin which had been in circulation. The *pivides assarii* appear in 1281; and in a British Museum MS. (Cott. Cleop. A. xvi., f. 50) is a detailed account of a trial in 1349, when gold nobles were tested by a jury against Florentine florins and found deficient *ultra debitum remedium*. Trial plates date from 1477.

[Brit. Mus. MS. Harl. 698.—Madox, *Hist. of Excheq.* i. 291.—Report to Compt. Gen. of Exchequer on *Trial of the Pyx*, 1866.—Reports of Dep. Master of Mint.—Standards Act, 1866.—Scargill-Bird, *Guide to Public Records*, p. 217.]

R. H.

QUADRUPLE. An abbreviated expression for "quadruple pistole" was not uncommonly used, up to the earlier years of the present century, to denote the Spanish gold coin of 4 pistoles or 8 escudos, commonly, but less correctly, known as the DOUBLOON (*q.v.*).

C. A. H.

QUALIFICATION. The amount of stock or shares required to be held by the directors of a joint-stock company. In some companies no such qualification is required, but in respect of most companies it is usual to fix by the

articles of association the amount of stock or shares necessary to be held by each director, and also to lay down certain conditions, the occurrence of which will cause a director's office to be vacated—generally these are bankruptcy or insolvency, or the holding of any other office of profit under the company.

In political affairs, qualifications of different kinds or degrees are required both for the holding of various offices and for the exercise of some of the duties of citizenship. These are the qualifications required for acting as

justices or as jurymen; and those for voting at elections of different kinds. Among these latter, before the qualification by rating becomes effective, there is a qualification by time, or length of residence, necessary. R. W. B.

**QUALIFIED ACCEPTANCE.** The acceptance of a bill of exchange is qualified when in terms it varies the effect of the bill as drawn. For instance, an acceptance is qualified when it is conditional, or when it is an acceptance to pay at a particular place and there only, or when it is the acceptance of some only of the drawees. The holder of a bill is not obliged to take a qualified acceptance, and if he takes it, he does so at his own risk, unless the previous parties assent thereto.

[Bills of Exchange Act, 1882, §§ 25 and 44.]

M. D. C.

#### QUANTITY THEORY OF MONEY.

According to this theory, prices are determined by the relation between the demand for, and the supply of, money. The demand consists in the offering of goods for money; the more goods are offered, the greater the demand. The supply consists of the money-pieces, whatever their material or form, available for the purchase of goods. The goods to be exchanged through the instrumentality of money remaining the same, an increase in the supply of money will, according to this theory, raise prices; conversely, a decrease in the supply of money will lower prices.

It will be seen that the quantity-theory is merely an application to the special case of money, of the general principle that value is determined by demand and supply. Prices, being merely the value of goods in exchange for money, must be deemed to be governed by the general law of value, unless some reason for an exception in this case be shown, which has never been done. However much men have cavilled at the quantity-theory, no one has ever yet seriously undertaken to show what determines the value of money—that is, prices—if supply and demand do not.

The causes of the difficulty which many persons feel in accepting the quantity-theory of money are: first, the complexity and elusiveness of the elements involved; and, secondly, the fact that those who deal with this subject, either as writers or as readers, do not sufficiently attend to the proviso which should be attached to every statement of this doctrine, namely, "all other things being equal." The first of these causes of the difficulty experienced in fully appreciating the quantity-theory cannot be removed; the second may be, by greater emphasis laid upon the proviso, and by fuller illustration of its scope. The habits of a people in regard to carrying and using money, the facilities for transportation, the introduction or extension of banking agencies—all these are subject to change; and no statistics of "per

capita circulation" can show whether the real money supply has been increased or diminished, unless such changes are taken into account. Moreover, the mere increase of the money-supply may itself become the cause of a further demand for money, which will enter to prevent prices from rising in proportion to such increase of supply. Thus, while it is estimated that the money-supply of Europe was increased 500 per cent during the first few generations after the discovery of America, prices are not generally thought to have increased more than about 200 per cent. The commerce of the world had been starved through the long silver famine of the middle ages; and the new supplies from Mexico and Peru were eagerly taken up by the depleted system. Speculation and enterprise arose in every land; new industries were brought into being, and traditional industries were rapidly increased; commerce extended its operations to new quarters of the globe. A similar effect, and possibly in a higher degree, was produced by the Californian and Australian gold discoveries. The increased commercial and industrial activity and enterprise, due to the flood of new gold, themselves became a part of the demand for money, and prevented prices from rising proportionally to the increase of supply.

It is not necessary to multiply illustrations of the importance of the proviso, "all other things equal." Nowhere is that proviso of greater importance than in respect to the theory we are considering. It does not, however, belong to the advocate of that theory to prove its validity, inasmuch as it constitutes merely a single case, under a principle which is in all other instances admitted to govern value. The burden of proof rests upon those who would dispute this theory.

[Prof. Francis A. Walker, *Money in its relations to Trade and Industry*.—*Political Economy*.—*Money*.—Nicholson, *Pol. Econ.*, vol. ii., 1897.—Zuckerlandl, *Theorie des Preises*, 1889.]

F. A. W.

**QUARANTINE** strictly means merely a period of forty days. It is practically restricted to the period—whether forty days or any other length—appointed by the law of most nations for the detention of a vessel arriving from a port where infectious disease is prevalent before persons on the vessel in question are admitted to intercourse with those on the land.

This species of detention seems first to have been adopted by the Venetians about 1484, probably on the alarm of some recurrence of the plague. It was little understood or used till 1719, when a vessel named the *Grand Saint Antoine* introduced into Marseilles a plague which carried off half the city. Up to 1800 there were very few regulations on the subject in England; in the earlier years of this century they became frequent, and a lazaretto was erected

at Chetney Hill, Kent. The earlier laws were directed mainly against vessels coming from the Levant, which was looked upon as the nursery of the plague. The act of 1825 (6 Geo. IV. c. 78) was the first consolidating act on the subject, and most of it is still in force; it is directed chiefly against plague and yellow fever. The privy council was till recently the controlling authority, but the local government board now is charged with the initiative in cases where quarantine is needful. Most of the British colonies have more or less stringent quarantine laws, and in many of them the law is enforced with absurd rigour and timidity. Most foreign countries also, especially those surrounding the Mediterranean, at times enforce quarantine very strictly, not only on arrivals by sea but also along the land frontier. The term "quarantines terrestres" was much in evidence at the International Sanitary Conference at Dresden in 1893.

Quarantine may be discussed: (1) in relation to international law; (2) in relation to the public health; (3) in regard to its effect on commerce and shipping. It is properly only in the last relation that it has any bearing on economics.

The evil effects of quarantine upon commerce arise: (1) from the delays imposed upon shipping; (2) from the risk that a cargo may be destroyed as infected. Both of these points may raise serious questions as to the liability of the owners of vessels. The great divergence of quarantine regulations in different ports is a fruitful source of commercial irritation. In a recent "Milroy" lecture before the college of physicians, Dr. Collingridge laid it down that in a commercial country like England quarantine had proved not only useless but actually impossible.

The application of the term "quarantine" to the regulation of the landing and sale of cattle coming from abroad requires passing notice. The administration of the rules for this purpose is under the customs authorities in the United Kingdom.

[Sir Sherston Baker's *Quarantine Laws*.—*Report of the General Board of Health on Quarantine*, 1849.—*Report of the International Conference on Quarantine*, 1850.—*Report of the West Indian Conference on Quarantine*, 1838.—*McCulloch's Commercial Dictionary*.—*Proceedings of the International Sanitary Conference at Dresden*, 1893. There is a collection of laws of the United States, now rather out of date.]

C. A. H.

QUARTER (measure); see MEASURES AND WEIGHTS.

QUARTILLO or CUARTILLO. Mexican silver coin of the value of one quarter of a REAL de plata, or one thirty-second of a PESO. Weight .8458 grammes, = 13.05 grains, fineness 902.7. This coin belonged to the currency system in force up to the year 1861, the smallest silver coin of the system then introduced being a five-centavo piece of nearly double

the weight of the quartillo, 1.353 grammes, = 20.88 grains.

Quartillo is also the name of Spanish measure, of liquid and dry capacity.

F. E. A.

QUASI-CONTRACT. A quasi-contract may be defined as a transaction or state of facts to which the law, independently of the volition of the parties, annexes an obligation similar to that which would arise from a contract. The term, though a familiar one in Roman law, has only been recently adopted into English law. Yet a quasi-contract is clearly distinct from an implied contract, the term which was formerly used to cover both classes of obligations. When a man goes into a shop and orders goods, and nothing is said about the price, there is an implied contract to pay for them, for this is the intention of both parties. But the obligation of a principal in the absence of any agreement to indemnify his agent for any thing done pursuant to his authority, is an instance of quasi-contract. The law annexes the obligation to the relationship between the parties.

[Anson, *On Contracts*, ed. vi. p. 357.]

M. D. C.

QUASI-RENT. See RENT.

QUATTIE—a silver 1½d. piece—is one of the most familiar terms in the daily life of the Jamaica negro. The little silver 1½d., struck in 1834, was first introduced into Jamaica in 1835, where it rapidly found a congenial home. It became popularly known as the "quarter," corrupted into "quattie," of the prevalent sixpence or bit. The last consignment of these pieces was sent from the mint to Jamaica in 1862, and a large number still circulate.

C. A. H.

QUAYAGE, money paid by the owners of ships for the use of a quay for unloading or mooring.

A. E. S.

QUEEN ANNE'S BOUNTY. In the year 1704 Queen Anne made a birthday gift to the church of the first fruits and tenths of ecclesiastical benefices. These were respectively the first year's income of the newly-appointed incumbent and a tenth part of the annual profit. They had been paid into the royal exchequer since 1534, when, by 26 Hen. VIII. c. 3, they were "united and knit to the king's imperial crown for ever." Previously they had been a kind of papal perquisite. The pope's claim to them seems to have arisen in the 13th century. It was often resisted, but never with much success, owing to the papal leanings of large sections of the clergy, and the policy of the popes in conciliating the crown by occasional grants of a portion of the proceeds to the king. Little came of the action which parliament was sometimes induced to take. For instance, at the parliament of Carlisle in 1307 the laity petitioned for legislation against the reservation of first fruits; but Edward I. entered into negotiations with Clement V., and before any-

thing was settled the great king died. Other attempts had similar futile endings; and when Henry VIII. broke with Rome he found the payments flowing in full tide into the papal coffers. So good an opportunity of replenishing his own was not to be lost. Hence the statute cited above, and also a new *valor beneficiorum* which has remained in force to the present day for the purposes of this taxation, though the money value of benefices is much greater than it was in the valuation of 1535, the date of the basis of the calculation.

The charter by which Queen Anne made her gift was confirmed by act of parliament (2 & 3 Anne, c. 11). The revenues derived from first fruits and tenths were vested in trustees, called the governors of Queen Anne's Bounty. The archbishops, bishops, and deans, together with a number of highly placed laymen, are the governors, whose duty it is to apply the funds at their disposal to the augmentation of small benefices. They have power to accept property from benefactors and also to sell any lands they may have acquired, the purchase money being treated as part of their general funds. A new and important function was conferred on them by an act passed in 1776, commonly called the Gilbert Act. By it and subsequent legislation in extension of its provisions, the governors of Queen Anne's Bounty are empowered to lend money at 4 per cent interest to incumbents, on the security of a mortgage of their benefices, for the repair and improvement of the glebe buildings, the erection of houses of residence, and other purposes. The consent of the bishop and the patron must be given before such a loan can be granted, and there are elaborate arrangements for the proper performance of the work, insurance, repayment, etc. To meet cases of serious diminution in the value of a benefice, an act was passed in 1896, giving power to the governors, with the consent of the patron, to extend the time for the repayment of loans and decrease the annual payments in proportion. In fact a great body of law has sprung up in regulation of the proceedings of the bounty office, and a still greater body of rules has been created by the governors themselves, while by a curious mixture of abolition and retention the now meaningless values of Henry VIII.'s time are still continued. The governors are now a most important corporation possessed of interests of various kinds in vast masses of ecclesiastical property, and they hold a capital sum of 7 millions. Their original function of providing for the augmentation of small livings has not been neglected. In the year 1906 a sum of nearly £26,000 was expended in grants for increasing the income of 135 benefices.

1895.—Stubbs, *Constitutional History*, ch. xiv., Oxford, 1875.—Stanhope, *Queen Anne*, ch. iv., London, 1870.—*Year Book of the Church of England*, London, 1897.] T. J. L.

QUEEN GOLD. In mediæval times, whenever a man fined to the king, he was required to make an additional oblation to the queen. This was called *Aurum Regine* or queen gold, and it was claimed for the queen by a special officer whose functions are minutely defined in several ancient records. It was, however, from the first a matter of doubt whether the amount of the queen gold bore a definite relation to the original fine, or varied according to circumstances. The author of the *Dialogus* asserts that, although it was generally a tenth of the original fine, the matter was under litigation at the time when he was writing. This point may now be definitely decided, as the *Red Book of the Exchequer* has preserved a passage, in which an exchequer baron, writing about the year 1230, assures us that the doubt which existed in the time of Henry II. had since been removed, and that queen gold should properly be reckoned at a tenth part of the original fine. The correctness of this statement is amply proved by a reference to the pipe rolls.

[*Dialogus de Scaccario*, ii. 26.—W. Prynn, *Aurum Regine*, London, 1668.—*Red Book of the Exchequer*, p. 760 (Rolls).] A. E. S.

QUESNAY, FRANÇOIS (1694-1774), born at Méré (Seine-et-Oise), where a commemorative monument was recently inaugurated, died at Versailles, was the head of the school styled by Du Pont de Nemours, in 1767, the *Physiocrats*. His father, a distinguished lawyer, but little favoured by fortune, brought him up in the country; and at the age of ten or eleven he could not even read.

His brilliant ability was strengthened by his powerful will, and he taught himself so successfully that at the age of twenty-four he became a master-surgeon. In 1737, La Peyronée, a celebrated surgeon of the day, appointed him the permanent secretary of the academy of surgery which he had just founded. In 1744 Quesnay graduated as a doctor of medicine, and became first an associate of the faculty of Paris, then physician in ordinary, and finally consulting physician to Louis XV. It is not, however, to these titles that the celebrity of his name is due. His fame as an economist equalled that attained some years later by Adam Smith. These two great thinkers were far from being jealous of each other; it was only the death of Quesnay which prevented Adam Smith from dedicating to him his *Wealth of Nations*.

The system of the *Physiocrats* (*g.v.*) is dealt with separately, here it must suffice to say that Quesnay's ideas are based on the predominance of agriculture over all other industries. Agriculture alone of all industries

produces more than the total sums advanced—the surplus is the famous *PRODUIT NET*, at the expense of which all the other industries, called barren, but not useless, live. In consequence, it is this *produit net* which finally supports all the weight of taxation, which, whatever its form or whatever is desired, always reverts more or less directly on agriculture.

Hence taxation has been divided into two classes—*direct*, that is to say, taxes levied by name and without intermediary means on agriculture, and *indirect*, in which other industries advance the amount in the first place, and are reimbursed by agriculture. As a result Quesnay divided mankind into three classes, the productive class, the class of proprietors, and the unproductive class. Without following this classification further, it suffices to mention that Quesnay struck the first blow at the *MERCANTILE SYSTEM*; he supported absolute freedom in trade, industry, and labour, but in politics he held that power should be in the hands of one man alone. He looked to public opinion, in the controlling power of which Quesnay, as is well known, has great confidence, provided the people were enlightened—to moderate the aberrations of despotism; and declared that in the contrary case it was the representative system alone that could struggle against the consequences of public ignorance. His saying, “If the halberd leads the kingdom, it is opinion which leads the halberd,” is well known. In seeking to disseminate his views he commenced by conversation, and then, at the age of sixty, he took up his pen and began, after mature and serious consideration, to give a summary of them in the *Encyclopédie*, in which he wrote, 1756 and 1757, the articles “*Fermiers*” and “*Grains*.” He carried this out more completely by publishing, in 1758, his *Tableau Économique*, a most remarkable analysis of the economic condition of his country.<sup>1</sup>

The king took great pleasure in the conversation of his *Sage*, as he delighted to call Quesnay. He lodged him at Versailles, where his apartments were on the *entresol*, whence the celebrated *Réunions de l'entresol* received their name. His rooms were the meeting-place of many of the able men of that time—DIDEROT, d’Alembert, Duclos, HELVETIUS, MARMONTEL, Buffon, besides the members of the *secte des économistes*, the elder MIRABEAU, BAUDEAU, ROUBAUD, MERCIER DE LA RIVIÈRE, ABEILLE, TURGOT, Trudaine, De Fourqueux, MALESHERBES, LAVOISIER, de Jaucourt, CONDORCET, RAYNAL, DU PONT (de Nemours), LETROSNE, and others.

Adam SMITH, when staying in Paris (1765-66), had frequent discussions with them.

<sup>1</sup> An *édition de luxe* was printed at Versailles under the eye of Louis XV. himself, who, it is said, corrected the proofs. A fac-simile reprint, from the original MS. with a preface by Mr. H. Higgs, has been published by the British Economic Association (London, Macmillans, 1895).

Though the first edition of the *Tableau Économique* has so completely disappeared that the *Bibliothèque nationale* does not possess a single copy—the greater and, it seems, the most important part was reproduced by Du Pont de Nemours in 1758 in his *Physiocratie ou constitution naturelle du gouvernement le plus avantageux au genre humain* (2 vols. 8vo);—*Le droit naturel, l'Analyse du Tableau économique les maximes générales du gouvernement économique d'un royaume, les deux problèmes économiques, and Les dialogues sur le commerce et sur les travaux des artisans*. What is described here, and the two articles in the *Encyclopédie* quoted above, are reproduced in full in the publication of Guillaumin (*Physiocrates*, 1st volume).

The elder Mirabeau, in his work *L'ami des hommes* (1756-60), has in the sixth and last part, published 1760 (the date is of importance), included a thesis under the title of *Tableau économique avec ses explications*.

Quesnay was the first in France to raise political economy to the dignity of a moral science. To discuss with his disciples the means of improving the lot of the people was his one pleasure. Though in high favour at court, he was never a courtier, and only employed the favour which he stood in there for the advantage of others. His character and brilliant intellect were held in high esteem; and throughout literary and philosophic Europe, Quesnay and his ideas were a leading subject of discussion for some half century.

It must, however, be mentioned that he had some opponents, among others FORBONNAIS, who was not without ability.

The “*éloge*” of Quesnay was spoken in 1774 by Grandjean de Fouchy at Paris, and in 1775 by the Comte d’Arlon at Lyons. Eugène Daire wrote a very interesting notice on him (Edition Guillaumin), and his *Œuvres économiques et philosophiques*, preceded by an introduction and note by M. Aug. Oncken, appeared in 1888 at Frankfurt.

A. C. F.

QUETELET, LAMBERT ADOLPHE JACQUES (1796-1874), born at Ghent, died at Brussels, was the first promoter in France of the study of moral statistics, which declines to limit enquiry to material facts only, investigating also and classifying moral qualities. He may also be said to have originated, in 1871, the study of anthropometry and of the methods which at the present time are so largely employed in the identification of criminals.

His principal works are:—*Sur l'homme et le développement de ses facultés ou essai de statistique sociale*, 1835, 2 vols. 8vo.—*Lettres à S. A. R. le duc régnant de Saxe-Cobourg et Gotha sur la théorie des probabilités appliquées aux sciences morales et politiques*, 1846, 8vo.—*Du système social et des lois qui le régissent*, 1848. (See sects. ii. and iii. of the first chapter of *Du système social et des lois qui le régissent*; and the third chapter “*Des qualités morales et des qualités intellectuelles*,” and “*De l'humanité*.”)—*Physiologie Sociale, ou Essai sur le développement des facultés de l'homme*, 1869, 2 vols. 2nd ed.; *Anthropométrie*

ou mesure des différentes facultés de l'homme, 1871.

A. C. F.

QUIA EMPTORES or the statute of Westminster, iii. (18 Edw. I., stat. i.), is the first statute since the conquest which (1) authorised an out-and-out sale of land, and (2) prohibited subinfeudation, or the qualified sale of land under which the purchaser held his land of the vendor. This statute established free trade in land. It did not, however, apply to tenants in villeinage, nor to tenants *in capite* (the landholders who held directly of the king). Before 1290 alienation of land was grudgingly permitted by the Anglo-Norman legislature. Under a law of Henry I. c. 70, a man who purchased land might, but a man who inherited land might not, alienate it, Glanville adding that even then the vendor might only alienate part of the land *quia non potest filium suum eachevare*. Alienation was not only regarded as a fraud on the heir, but also as a fraud on the lord. For instance, Henry III.'s Magna Charta (1217, c. 39, and 1225, c. 32), the most liberal law before *Quia Emptores*, allowed freeholders, other than tenants *in capite*, to alienate only a part of their land; they had to reserve a sufficient part to enable them to perform the rents and services incidental to their tenure. Coke interprets "a sufficient part" as "one half." Even these enabling statutes refer rather to subinfeudation than to out-and-out sales, because *Dedi et concessi*, the operative words of a feoffment, which was the only means of alienating land, meant at that date subinfeudation, not sale, unless sale was expressly mentioned (see Wright). Stubbs describes *Quia Emptores* as meant to do to the feudal lords what *De Religiosis* (1279) was meant to do to the church. Its intention was doubtless political, *i.e.* to limit the independent impositions and jurisdictions of the nobility, but its most important effect was economic, *i.e.* to make land saleable, and, according to Hallam, largely to increase the number of landowners.

As to tenants *in capite*, they could not at this date alienate without licence from the king—the penalty being forfeiture, as in the case of Thomas of Hoton (*Rot. Clavus*. ii. 38), or fine. It is said by Butler, Elton, and others that *Quia Emptores* was "extended" to them by 17 Edw. II. st. i. c. vi. and 34 Edw. III. c. 15. But Edward II.'s statute only extended the provisions cited from 9 Henry III. c. 32 to tenants *in capite*; viewed as an enabling statute, it was according to Wright a dead letter; viewed as a disabling statute, it, along with 1 Edward III. st. ii. c. 12, which substituted a fine for forfeiture, only imposed what was practically a tax upon alienations by tenants *in capite*. Edward III.'s statute (1360) only confirms alienations during the reigns of Henry III. and his predecessors "saving the king's prerogative." There is no general prohibition against alienation by tenants *in capite* contained in any statute except these. And no statute expressly prohibits subinfeudation

by tenants *in capite*. It is difficult, therefore, to see why the king might not have joined with his tenants in subinfeudating down to 1660, or why they might not have done so without his consent, thereby incurring, at most, a fine. In 1660 feudal incidents, including rent-services, fines on alienation, aids, etc., etc., were swept away except such as existed in connection with memorial and frank-almoign tenures valid at that date. So that since 1660 the question has no importance. Whatever is the answer to the question "When and how far was *Quia Emptores* extended to tenancies *in capite*?" all agree that, as a fact, (1) there has been no subinfeudation—no creation of feudal incidents, or of manors, or of frank-almoign tenures—by tenants *in capite* since either 1290 or 1324 or 1360, by other freehold tenants since 1290; (2) tenants *in capite* have enjoyed free sale (subject to fines) since 1324, and without fine since 1660—these privileges have been enjoyed by other freehold tenants since 1290. And both these results are due indirectly or directly to *Quia Emptores*.

J. D. R.

QUINARIUS. The quinarius or half DENARIUS (*g.v.*) first appeared in 269 B.C., and continued to be issued up to 206 B.C. The type of this first coinage was the head of Roma with the numeral V., denoting five *asses*; reverse, above the word Roma, the *dioscuri* galloping with lances in rest. Its weight was 36 grains, or 144 to the pound of silver. The second issue was about 104 B.C., when the *victoriatrus* was withdrawn. It had the type of the *victoriatrus*, but was marked with the letter Q. This issue of the quinarius lasted until about 84 B.C. A third began in 49 B.C., and from that time it continued to be coined, though in small quantities and in an interrupted way, under the empire. The senate in the reign of Philip (A.D. 244) ordered a coinage of large bronze quinarii. This form was known as the *Philippus æreus*.

[E. Babelon, *Monnaies de la République Romaine*, 1886.—*Encyclop. Brit.*, 9th ed., vol. xvii., art. "Numismatics."] R. H.

QUINCEY, THOMAS DE. See DE QUINCEY.

QUINTOS, the fifth part of the produce of the gold and silver mines in America, for which, in 1525, the Spanish kings gave up their former exclusive right of property in these. In 1723 and 1777 this contribution was reduced to 1½ per cent for silver and 3 per cent for gold.

[Canga Argüelles, *Diccionario de Hacienda* (1826).] E. CA.

QUIT RENT. A small fixed annual payment, formerly made by the tenants of a manor in commutation of all customary services

and payments in kind. Quit rent was sometimes written white-rent, whence some antiquaries have maintained that quit rents were paid in silver; white is, however, probably nothing but a phonetic variation of quit.

[Cowel, *Interpreter*.]

A. E. S.

**QUITTANCE.** Low Latin *Quitancia*. When an officer accounting at the exchequer, or elsewhere, paid in the exact sum of money due from him to balance his account, the words *Et quietus est*, or *Et equatur*, used to be written at the foot. When this *quietus* was granted, whether the officer had actually paid or been excused payment, he was said to have a *quitancia* or quittance.

A. E. S.

[Du Cange, *Glossarium*.]

**QUORUM.** The minimum number of the members of a committee or of any administrative body, whose presence is necessary to constitute a competent business meeting. The number constituting a quorum at the meetings of shareholders or directors in a company is generally fixed by the articles. This use of the word *quorum* has arisen out of the terms in which commissions for holding sessions of justices were formerly couched. Of the whole number of persons holding commission as justices of the peace, only certain individuals were held to be competent to preside at sessions. These were specifically named in the commission that was issued directing the sessions to be held, at which it was required that at least two justices should be present, of whom one must be of these persons; or, as it ran: "*quorum AB, et CD, et EF, unum esse volumus*." These persons were usually termed "justices of the quorum." The quorum clause was omitted when the form of commission was revised under 40 & 41 Vict. c. 41 (1877). Since the beginning of 1878, the names of all the justices of the peace for the county have been inserted in a schedule attached to the commission.

R. W. B.

**QUOTA.** A proportion, a part or share. The part which every shareholder or member of a company or society is bound to contribute; also the proportion of dividend belonging to each member.

R. W. B.

**QUOTATION.** On the stock exchange, or in commercial markets generally, the price of the day as quoted in the official list of any particular security or commodity.

R. W. B.

**QUOTITÉ DISPONIBLE (Fr.).** The right to dispose of property by will or by gifts *inter vivos*, being restricted in France in the case of persons having or leaving heirs in a direct line, descending or ascending, the *quotité disponible* is the portion of which they have the free disposal. This portion is one half if the deceased

leaves only one legitimate child, a third if there are two, a fourth if three or more; any number of grandchildren counting only for their respective parents. If he leaves no descendants, but ascendants in both lines, paternal and maternal, the disposable portion is one half; if in one line only, three-fourths. If he leaves neither descendants nor ascendants, the testamentary restriction ceases. Gifts *inter vivos* are counted as part of the *quotité disponible* and cannot prejudice direct heirs.

[Code Civil, arts. 913-919. See also BEQUEST, POWER OF; WILL, BEQUEST BY.]

T. L.

**QUOTITÉ AND RÉPARTITION (Fr.).** The two great divisions in the system of taxation in France. *Impôts de quotité* are based on tariffs, the yield of which can only be estimated approximately, as is the case with the revenue from stamps, successions, dividends and interests, customs duties, etc. In *impôts de répartition* the state fixes the sum the tax is to produce, and an assessment is made of the portion to be provided by each of the administrative divisions of the territory; first by the central authority among each of the departments; the council-general of the department next divides the total sum between each *arrondissement*; the councils of *arrondissement* then subdivide their contingent among the communes; and finally local councils in the communes assess each property holder for his contributive share according to the land register book. Direct taxes are generally *impôts de répartition*, but the trade license or *PATENTE (q.v.)* is an exception, and the doors and windows tax is a mixed system; repartitive in the total but an *impôt de quotité* in the incidence, the portion to be paid by each landlord increasing not only with the number of doors and windows, but also with the population of the locality. A certain latitude is also permitted to the local authorities in the assessment of the *mobilier*, or tenants' occupation tax, provided that the total sum due by the commune is realized and not exceeded. The system of repartition has advantages for the prevention of fraud in countries with a rudimentary or defective administration, as the inhabitants exercise a control over each other, knowing that if some individuals do not pay their fair share of the tax, the burden will fall more heavily on themselves. On the other hand, this mode of taxation presents greater inequalities, as it does not follow the development or decline in the value of real property in the different departments or communes, and the balance can only be restored by a periodical general survey.

[Edouard Vignes, *Traité des Impôts en France*.—P. Leroy-Beaulieu, *Traité de la Science des Finances*.]

T. L.

RACK RENT. A rent equal to the full annual value of a tenement. Sometimes a special meaning is given to the term in a statute, e.g. the Public Health Act 1875, defines for the purposes of the act a rack-rent as a "rent which is not less than two-thirds of the full net annual value of the property out of which the rent arises."

[Copingier and Munro, *On Rents*, London, 1886.]

J. E. C. M.

RADMANNI. The *rodknights* or *radchenistres* of Domesday. These were free proprietors with considerable holdings, and their service was to ride as escort to the lord or lady of the manor, a duty which could scarcely be performed by men who were not of free condition. Maitland's *Select Pleas in Manorial Courts*, p. 78, show a *rideman* employed to enforce army service. The Gloucestershire *liberi homines radchenistres* (Domesday, f. 163) had villeins on their land, while in Worcestershire Lefric the radman held a hide and a virgate. Some, however, seem to have been unable to leave the manor, that is, to sell their holdings, and others were bound to render small predial services. Bracton, i. 279, classifies their tenure as *petit serjeanty* (see SERJEANTY, PETIT).

R. H.

RAE, JOHN (1786-1873), probably a native of Scotland or the Orkneys, perhaps the father of Rae the arctic explorer, after pursuing in youth the vast design of "gathering together all that consciousness makes known to us of what is within and all that observation informs us of what lies without," into "a true *Natural History of Man*, by a sudden and unexpected change in his circumstances . . . exchanged the literary leisure of Europe for the solitude and labour of the Canadian backwoods" (preface to *New Principles*). Here he composed his *New Principles on the Subject of Political Economy*, which was published at Boston in 1834.

The main purpose of the book is set forth in the title: *Exposing the Fallacies of the System of Free Trade and of some other Doctrines maintained in the "Wealth of Nations."* Distinguishing between individual and national wealth, Rae says it is easy to understand how one individual comes to get hold of a large share of the national means, but not "how a general increase of these means or instruments should take place without some accompanying discovery of an improvement in their construction" (p. 19). The national capital would not be much increased by the indefinite multiplication of flails (p. 20). To attribute the growth of wealth to parsimony would be like attributing it to population. Both are necessary conditions, but we need take no thought for their growth, provided that invention progresses (bk. i. ch. i.). "Invention is the only power on earth that can be said to create." Adam Smith's dictum that "the industry of the society can augment only as its capital augments," is combated

at length (ch. ii.). Rae instances the case of two brothers in the interior of Canada who, in order to get boots made on their own farms, "were at the pains and expense of sending one of the young men to some distance to master the trade of shoe-making." Why should not government similarly introduce inventions? The argument for protection of infant industries (as we should now say) is forcibly urged by Rae in the second chapter of his first book.

The second book, *Of the nature of Stock*, forms Rae's principal contribution to economics. He applies the term "instruments" to "all these changes which man makes in the form . . . of material objects for the purpose of supplying his future wants." A field is an instrument; so is the wheat growing in it; and bread, "until it is in process of consumption." *Exhaustion* is the "passage of things from the class of instruments into things which are not instruments" (p. 92). Instruments may be arranged in an order—A, B, C—determined by the period at which each issues, or would issue if not before exhausted, in a result equivalent to double the labour expended on it; order A doubling in one year, order B in two, and so on. The causes determining the amount of instruments formed by a society are enumerated as (1) the quantity and quality of the materials owned by it; (2) the strength of the *effective desire of accumulation* (a term adopted by Mill); (3) the rate of wages; (4) the progress of the inventive faculty.

The second and fourth causes are chiefly considered by Rae. He begins by showing that mere postponement—the arts of production being stationary—is apt to increase produce (ch. v. cp. Böhm-Bawerk on *Roundabout Methods*); then (ch. vi.) investigates the circumstances which determine the strength of the effective desire of accumulation. They are (1) the benevolent affections; (2) the intellectual powers; (3) security. His account of that preference for the present which cannot be ascribed to a "mere reasonable regard for their own interest"—Jevons' factor *q* as distinguished from *p*—deserves to be quoted in full: "The actual presence of the immediate object of desire in the mind, by exciting the attention, seems to rouse all the faculties, as it were, to fix their view on it, and leads them to a very lively conception of the enjoyments which it offers to their instant possessions. The prospects of future good which future years may hold out to us seem at such a moment dull and dubious, and are apt to be slighted for objects on which the daylight is falling strongly, and showing us in all their freshness just within our grasp. There is no man, perhaps, to whom a good to be enjoyed to-day would not seem of very different importance from one exactly similar to be enjoyed twelve years hence, even though the arrival of both were equally certain" (p. 120). The different degrees of strength of the effective desire of accumulation are illustrated by splendid examples taken from different ages and countries (ch. vii.). In China, for instance, "instruments are about the order D." But long extracts, such as those which Mill has made, would be required

to do justice to these concrete illustrations. In a later chapter (x.) Rae dilates on the progress of invention in language almost worthy of Bacon. The accumulative and inventive faculties are his main theme; incidentally he has enunciated some important economic principles. For instance, among the advantages of division of employments (p. 164), that no instruments lie idle; that among the conditions determining value distance in time as well as quantity of labour must in general be taken account of. One of his most remarkable theorems is that the consumption of articles of *luxury*—which is defined as “the expenditure occasioned by the passion of vanity”—decreases with the reduction of cost. “Were pearls or lace to be got for one-tenth of the labour that must now be given for them, they would go completely out of fashion” (ch. xi. pt. i.; cp. Sidgwick, *Pol. Econ.*, bk. i. ch. iii. § 2 note; H. Cunyngname, *Economic Journal*, vol. ii. p. 37). The most original suggestion in the third book—which treats “the operations of the legislator”—is that by a tax on luxuries revenue might be raised without sacrifice to the consumer (bk. iii. ch. ii.).

John Rae, *Statement of some new Principles on the Subject of Political Economy exposing the Fallacies of the System of Free Trade and of some other Doctrines maintained in the “Wealth of Nations,”* Boston, 1834. [J. S. Mill, *Principles of Political Economy*, bk. i. ch. xi.—*Quarterly Journal of Economics* (January 1897). “A Forerunner of Böhm-Bawerk,” by C. W. Mixer.—*North American Review*, vol. xl. (high encomium tempered with, perhaps, just complaints of Rae’s terminology).] F. Y. E.

RAIFFEISEN, FRIEDRICH WILHELM (1818-1888), founder of the German agrarian loan funds, was son of the burgomaster of Hamm on the Sieg. Educated at home, he at first entered on a military career, which, through an affection of the eyes, he was soon forced to abandon. He then turned to official life, and filled several municipal and other public positions with great industry and distinction. The difficulties of the smaller agriculturists in 1846-47, which he attributed to their bad credit and consequent liability to extortion from unprincipled usurers, led him to establish in Meyerbusch and Heddersdorf, of which he was burgomaster, the first agrarian mutual loan societies which existed in Germany; and to the extension of these institutions he devoted all his energies both as propagandist and as organiser. He founded in 1878 a periodical entitled *Landwirthschaftliches Genossenschaftsblatt* as organ of such associations, in explanation and defence of which he issued several independent publications, the most important being *Die Darlehensvereine* (7th ed., 1889). He was also active in the sanitation of the districts with which he was officially connected. His labours so seriously impaired his health that he was obliged in 1866 to retire from active employment, but continued to superintend and improve

the institutions he had created, and also did good service in promoting the construction of the railway on the left bank of the Rhine. He is held in grateful memory by the inhabitants of the Rhenish provinces, to whose material and moral welfare he so largely contributed.

The institutions founded by Raiffeisen were specially designed for the wants of an agricultural population. Their peculiar features will be best understood by a comparison with the *Vorschussvereine* created about the same time by SCHULZE-DELITZSCH, which are better adapted to urban communities. In these, loans are made for short periods, and the interest charged is as high as from 8 to 12 per cent. The members are shareholders and receive dividends. The managers are paid. The area over which transactions extend is unlimited. Nothing but the financial security of a loan is considered; no account is taken of the use which the borrower makes of it, or of his personal character. All these conditions are changed in the *Darlehenskassenvereine*. Raiffeisen intended them to serve moral as well as economic ends, by awakening sympathy and fortifying the social ties between inhabitants of the same rural district. Only members of an association can obtain a loan; it must be sought for a definite productive object, and the association is entitled to ascertain that it is *bona fide* used for that object. It is a cardinal principle of the system that the operations of each association should be restricted to a small area, which, in Raiffeisen’s opinion, ought not to contain more than 1500 souls. It is thus ensured that the members should know each other’s character and circumstances—a condition necessary for their financial safety, the mutual liability being unlimited. Not more than 4 or 5 per cent is charged to the borrowers. No dividends are paid; any profits realised, after expenses are defrayed, go, not to the members, but to a reserve fund to cover losses; and when they exceed a certain amount, they are applied to purposes of common utility. The loans are for one or two, sometimes for five or even ten years; when there is urgent danger of loss, the loan may be called-in within so short a time as four weeks. The managing committees work gratuitously; the only salaried officer is an accountant (*Rechner*), who receives a small stipend. The principles on which Raiffeisen founded these institutions were at first much disputed, but have been vindicated by their success. They have effectually delivered the German agriculturists, especially the small and middling proprietors of land, out of the hands of usurers. According to recent accounts, none of them has become bankrupt; liquidations have been rare, and have not caused material loss to the members. They have extended from Germany to other countries, and are now numerous in Austria, Switzerland, and Italy.

To enable the different German associations to render mutual support, a *Landwirthschaftliche Centraldarlehenskasse* was established in 1876, which has its seat at Neuwied.

[For the life of Raiffeisen, see Leisewitz in *Allg. Deutsche Biogr.*, and Schmidt in *Handb. der Staatsw.*; for his institutions, Marchet in the latter work, ii. pp. 906 *et seq.*, and Von der Goltz in Schönberg's *Handb. der P. E.*, pp. 123 *et seq.*]

J. K. I.

### RAILWAYS.

Railways, p. 252; Light Railways, p. 258.

**RAILWAYS.** Though railroads in a rudimentary form date from the 16th century, while the history of steam-traction goes back to Cugnot in 1771, the entire existing railway system of the world has, with negligible exceptions, been constructed, as far as England and the United States are concerned, within the last seventy years, and, as far as other countries are concerned, within the last sixty. In that time about 450,000 miles of line have been built, nearly one half of which is in North America, the United States alone counting for over 180,000 miles. Europe has about 155,000 miles. The five great powers headed by Germany with 27,000, and finishing with Austria which has 17,000, average about 21,000 miles apiece, which last figure is also the total for the United Kingdom. British India and Australasia have 30,000 between them, shared in tolerably equal parts. The balance is mainly either in South Africa or in South America. The cost of the world's railways reached, in 1895, the enormous total of £7,336,000,000, a figure of some interest when compared with the total capital of the commercial countries of the world, or with the amount of their national debts. As Professor Hadley observes ("The Railway in its Business Relations" in *The Railways of America*, London, 1890, 8vo), the railway "probably represents one-tenth of the total wealth of civilised nations, and one-quarter, if not one-third, of their invested capital. It is doubtful whether the aggregate plant used in all manufacturing industries can equal it in value. The capital engaged in banking is but a trifle beside it. The world's whole stock of money of every kind—gold, silver, and paper—would purchase only one-third of its railroads."

The total sum is, however, made up of individual costs so completely different that no conclusion or average of any practical utility can be extracted from them. To attempt to base any practical conclusions on such an average would be as absurd as to average together a mile of a Devonshire lane, another mile of the Simplon or the Corniche Road, and a third mile of Oxford street. In England itself, whose railway capital averages over £50,000 a mile, we have individual lines

capitalised at from £2000 to £1,000,000 per mile. Nor can any one say how far nominal capital represents either actual expenditure or present value. For example, under the first head, the share capital of many American railways was originally issued for but a tithe of its face value. Against this, American railways every year spend out of revenue immense sums on what in any other country would be regarded as fair objects of new capital expenditure. Again, continental railway capital has already been in considerable measure paid off through sinking funds. Instances under the second head are, on the one hand, the great sums sunk in England in parliamentary contests, in lines to collieries and mines now worked out and abandoned, or, on the continent, devoted to paying interest at a high rate on capital, not only during construction, but during what is called in France *exploitation partielle*; and on the other, the immense appreciation in the value of the real property held by railway companies, both agricultural lands in newly-developed countries, and, still more, building sites in the heart of great towns, whether as old as London or as new as Chicago.

In England and the United States, which have between them half the mileage and half the capital of the world, practically the whole of the money has been found by private enterprise, in England controlled and directed throughout by public authority, in America left in the main unrestrained. In the remaining countries of the world railway capital has been provided, if not directly by the state, then in reliance on state assistance, usually in the form of a direct government guarantee. Belgium, the smaller German states, and our Australian colonies, may be taken as leading instances of government construction; France, and in a former generation India, as leading instances of government guarantee. Government aid may, however, also be given, and has been given in many other forms—loans on favourable terms as in Ireland, grants of land as to the Canadian Pacific, special exemptions from customs, taxes, and local rates, as in Austro-Hungary, subscription to shares, more especially deferred shares, as in many continental countries, or, finally, direct gifts of money, as has probably occurred in every country of the world with the exception of England in the limited sense of the name. Contrary to what might have been *a priori* expected, the railway capital found by unaided private enterprise bears interest at a lower rate than the capital raised on state security. Railway capital in England earns on the average about 4 per cent, and in the United States only 3 per cent. On the other hand, in India the guaranteed dividends, owing to the depreciation of silver, work out to about 8 per cent, while in France two of the six great companies

are guaranteed 7 per cent on their share capital, which, however, is not a large portion of the total, two other companies 10 per cent, one 11 per cent, and one 13 per cent. The guarantee system often produces unexpected results; for example, in France the state prohibits railway competition; on the other hand, it has spent and continues to spend very large sums in improving internal water communication. Private carriers along these improved waterways, which are entirely free from toll, have of late years carried off so much traffic from the railways, more especially from the *Ouest*, which runs along the canalised Seine, as to deplete very seriously the railway earnings, and so to add to the amount which the state has to make good under its guarantee (see on this point more especially Ulrich's *Staffeltarife und Wasserstrassen*, Berlin, 1894, 8vo, and Colson's *Transports et Tarifs*, Paris, 1890, 8vo). Italy has handed over its railways, which are also guaranteed, to two great companies—the Mediterranean and the Adriatic—operating the one along the western and the other along the eastern coast of the peninsula, but meeting each other at all the principal points, at Naples and at Rome, at Florence and at Milan. Consequently they are encouraged to compete with one another, but do so at the cost of the state. This Italian system is now over ten years old. Within the last few years it has been followed in Holland. Of purely state lines, the Prussian railways not only pay their way, but leave a handsome surplus, so do the state railways of the Cape and Natal. The Belgian and Hungarian railway budgets about balance. But the general rule is, with unimportant exceptions, that from St. Petersburg to Sydney, state railway earnings are insufficient to meet working expenses and capital charges, and a deficit more or less large has to be made good at the expense of the general taxation of the country.

Turning from capital and finance to management and methods of working, the United States comes first as the country where railways are most independent in fact, though not in theory. In many states of the American union laws, whose constitutionality is in many instances more than doubtful, but which the state authorities rarely attempt to enforce, while the railway companies almost always disobey or evade them, appear to lay very stringent fetters on railway freedom. Practically speaking, however, an American railway company constructs a line when it pleases, where it pleases, how it pleases, runs what trains it likes at such times and speeds as it thinks proper, and, subject to the obligation which in America is regarded as arising at common law to treat all its customers equally without individual favour or preference, charges such fares and rates as the higgling of the

market may enable it to obtain. In England this freedom is very greatly circumscribed. Parliament decides whether, and under what conditions, a railway shall be built. The Board of Trade control over methods of construction and working has existed from the beginning, and since 1889 has become dominant. Rates and fares have always been subject to Parliamentary *maxima*, presenting throughout serious limitations in the case of passengers, though not often in the case of goods. Since the beginning of 1893 these limitations have become very stringent for goods also, while since August 1894 it has been practically enacted that, though goods rates may be reduced at the pleasure of the companies, they can never be varied in an upward direction. Still by the side of the continental companies, which as a rule cannot alter the timing of a single train, or vary a single rate of charge, or change in the smallest detail the construction and equipment of their lines, down even to the carpets and curtains in the general manager's office, without direct state authorisation, our English railways must be acknowledged to enjoy a large measure of freedom. When we pass from private railway undertakings to state railways the government naturally settles everything. But even here an important distinction must be drawn, and on the one hand in autocratic countries like Prussia we find voluntary railway councils, composed of merchants and manufacturers and the like, organised with the object of interpreting to the bureaucratic administration the wishes of the outside community, without, however, any power to make those wishes effective; on the other hand, in purely democratic countries like our Australian colonies we find semi-independent commissioners, imported as a rule from outside, and holding office for a fixed term of years, interposed to prevent the railway management being too sensitive to passing gusts of popular opinion, or too promptly responsive to direct political control.

The point where railways most definitely enter the field of economics is the matter of rates and tariffs. A word first as to the machinery by which railway tariffs shall be regulated. It may be assumed that even where railways are private undertakings, some measure of regulation by the state is practically, though not perhaps theoretically, unavoidable. This regulation may take very various forms. In France the control is purely administrative. The minister of public works, with the assistance of about 1000 trained subordinates scattered all over the country, and of a *Comité Consultatif* of fifty or sixty experts of high position, decides the propriety of every proposed new rate. In England we began by fixing parliamentary maxima, and leaving the companies free to vary their rates as they pleased within them, subject

only to judicial penalties if they treated one customer worse than another. The interpretation of the common law, however, as modified by the acts of 1845 and 1854, was too much a matter of policy and economics, and too little of pure law, for judges to take kindly to it. As the railway horizon widened, and competition of individuals on the same spot gave place to competition between different parts of the country, and this, in its turn, to competition between different countries and continents, the inadequacy of the machinery became obvious. The Traffic Act of 1873 set up a new tribunal, in the main a law court, but containing a preponderating lay element; the Act of 1888, while further strengthening the powers of this composite court, set up beside it, for certain purposes and with limited jurisdiction, a purely administrative tribunal in the shape of the Board of Trade. Judging from present indications, it may be said that, while the administrative tribunal is much more prompt and does its work in a much simpler and cheaper manner, it is only adapted for the decision of comparatively simple and small cases. It may be that the legislation of 1894 points to what will be our ultimate solution of this problem, an administrative tribunal of first instance with no compulsory powers, followed, if need be, by an appeal to a semi-legal tribunal wielding the full authority of an ordinary court of justice. In America, control over traffic within the limits of a single state belongs to the state government. Interstate traffic can be only regulated by the federal authorities. Interstate commerce was left uncontrolled till the year 1887, when a federal tribunal, which however lacked and still lacks the powers of a court of justice, was set up at Washington. Recent decisions of the supreme court (1897) have reduced its powers almost to a nullity (see INTERSTATE COMMERCE LAW, U.S.A.). State regulations of local rates has a long and most interesting history. Broadly the states have divided themselves into two groups. Both groups have established commissions, with members both lay and legal. But while the one, led by Illinois, has empowered the commissioners to fix rates and compel, if they could, their observance, the other, led by Massachusetts, has empowered their commissioners merely to express opinions as to what the rates ought to be. The result may be said to be this: commissions of the Illinois type begin by giving orders, which the railway companies often ignore or defy, which experience proves them to have rightly defied, and which, after a time, the commissioners themselves are satisfied to forget; commissions of the Massachusetts type express opinions, to which the railway companies find themselves constrained to conform. [See on the American state commissions, Frank H. Dixon, *State Rail-*

*way Control*, in American Library of Economics and Politics, 1896; and F. C. Clark, *State Railway Commissions*, in publications of American Economic Association for 1891.]

More important than the question by whom tariffs are to be fixed and controlled is the question of the actual amounts of the tariffs themselves. According to the German economists (see Sax, *Verkehrsmittel*, Vienna, 1878, 8vo, with a second volume *Die Eisenbahnen*, 1879) private railway companies will always fix their tariffs so as to obtain the largest possible revenue. State railways tariffs, on the other hand, may be fixed (a) to earn an income to the state beyond the sum necessary to pay interest on capital—this Sax calls *Steuerprinzip*; (b) just to cover working expenses and interest—*Gebührenprinzip*; (c) to cover working expenses or part of them but not interest (sometimes called *Prämienprinzip*); or (d) there may be no tariffs at all and railways be open for public use gratis—this Sax calls *Prinzip eines allgemeinen Genußgutes*. Such is the theory. But in practice private railways are restrained from theoretically possible extortion partly by legal maximum tariffs, but much more by the fact that the highest rates seldom yield the highest revenue, and by the competition of other producing and consuming districts. The *Steuerprinzip* is the principle at which every state administration naturally aims. Only one important state railway administration, the Prussian, has attained it in practice, but the Cape Colony and Natal have reached the same result for the last two or three years, and it is also reached in another field of transport by the British post office. So far as state railway administrations have come down to the level of the *Gebühren*, or even *Prämienprinzip*, they have done so under compulsion either political or economic. None have yet reached, or indeed sought to reach, the stage of gratuitous use, nor indeed is this position likely to be attained in practice. It is true that in every country the state provides roads for gratuitous use. In many continental countries it provides internal waterways gratuitously as well, but it has never sought to provide gratuitously carts, omnibuses, and barges or the horses to draw them, and in the case of a railway its special technical qualities render inseparable the provision of the three elements of transport, road, rolling stock, and motive force.

Tariffs may be classified also in reference to their form. Dealing with passenger tariffs first as being much the most simple, they may be said to be always based on mileage. The possibility of adopting a different, the so-called "postal," principle, which ignores mileage altogether, has frequently been discussed by theorists, more especially in Germany (see Ulrich, *Personentarifreform und Zonentarife*,

Berlin, 1892, 8vo; Perl, *Les Reformes des Tarifs de Voyageurs*, Brussels, 1893, 8vo (originally published in Russian); and Professor James's article "Reform in Railway Passenger Fares" in the *Quarterly Journal of Economics* for January 1891). As the question is not likely ever to become one of practical politics it may be dismissed with this single observation. A uniform charge irrespective of distance is possible in postal business for two reasons, (a) because the cost of actual conveyance is but small relatively to the total cost of dealing with a letter, and (b) because the amount involved in each individual case is absolutely trifling. Almost the whole cost of passenger traffic is conveyance cost, and it is not trifling. Such charges cannot be averaged. For instance, the average English passenger pays about 8d., but this average is made up of first-class passengers from Euston to Wick, and third class passengers from Charing Cross to the Mansion House. If passengers will consent to pay 8d. from Charing Cross to the Mansion House, it may be possible to carry other passengers from London to Wick for the same money; but not otherwise. The zone tariff of Hungary, and the less famous zone tariff of Austria, have been frequently described as a concession to the postal principle. These are mere mileage tariffs with the unimportant alteration that charges are made and accounts kept in units which are multiples of a mile.<sup>1</sup> Mileage tariffs, however, need not be at the same rate per mile throughout. A system by which the rate per mile decreases in proportion as the number of miles increases, has long been in existence for goods, and of late years has been adopted for passenger traffic also. Such tariffs are known abroad as a *base décroissante* or *barème Belge* from their country of origin, in Germany as *Staffelltarife*; if we have an English translation, it is perhaps "differential rates," though "sliding-scale rates" would be more appropriate. Since December 1894 this principle has been adopted throughout the Russian empire. Finally, in every country, besides the normal fare there are some important derogations from it in workmen's tickets, season tickets, tourist tickets, circular tickets, excursion tickets, return tickets, and so on. These exceptions are sometimes so important in modifying the general average, that in France the actual fare paid per mile by passengers of each class is only about two-thirds of the regular tariff of that class. In England too there is reason to believe, though in the absence of statistics no precise

figures are attainable, that the average fare is not more than 3d. per mile, whereas the regular tariff rate for the lowest class is 1d. In America, with the most highly competitive system in the world, the standard and average passenger rates seem to correspond more nearly than in other countries.

Turning from passengers to goods, whereas passengers classify themselves, goods rates are based on elaborate classifications drawn up and enforced by the railway administrations. There are usually from four to ten categories—the English classification has eight—into which goods are divided according to the following considerations: value, proportion of weight to bulk, fragility, convenience of handling, volume available or offered for carriage. Goods in the highest class will be charged in England perhaps five times as much per ton per mile as those in the lowest; in America the ratio is more like one to ten. Theoretically, the German railways have no classification. Their so-called "reform" tariff professedly charges one and the same mileage rate for all goods conveyed in small lots; another and much lower rate for the same goods when conveyed in half-truck loads of five tons; and a third still lower rate for full ten ton consignments. Practically, however, the "small consignment" or unclassified rate only applies to about 5 per cent of the traffic, and the remaining 95 per cent is, by means of a system of special classes, much too elaborate to be described here, classified for practical purposes almost as much as the traffic of any other country. Now the effect of classification is this, that a ton of copper ingots is charged, say, 3d., a ton of lead pigs 2d., and a ton of pig-iron 1d. per mile, though the cost to the railway company, except for a trifling allowance under the head of insurance against theft, is in all three cases identical. In other words, the railway systems of the world, state as well as private, agree in charging traffic "what it will bear," in basing, that is, their rates not on what the service costs them but on what it is worth to their customer. The phrase "charging what the traffic will bear" has been described on high authority as a "vile phrase." Yet the principle involved in it when applied to a water rate levied according to rateable value, so that the poor man pays only actual cost of pumping, and the high charge on big houses bears the whole interest on capital, is usually regarded as wise and statesmanlike. The point cannot be further elaborated here. This much may, however, be said: if the maxim be considered from its reverse side as meaning "not charging what the traffic will not bear," it will be seen to involve a principle, not of extortion, but rather of protection to the weak, and careful consideration of the community as a whole. In fact the principle

<sup>1</sup> The famous Hungarian 14th zone, which equalises all fares beyond a distance of 225 kilometres (141 miles), is of very small practical importance, as there exists almost no traffic to which the rule can be applied. The motive, moreover, for the establishment of this zone was the purely un-ideal desire of the Hungarian state railway administration to abstract certain long distance traffic from neighbouring private railway companies.

might be amplified into that which is commonly accepted as a canon of just taxation—so to raise the necessary revenue, which in this case is working expenses *plus* interest on capital at the normal rate, that the individual contributor shall feel the pressure as little as may be, that the cost of collection shall be minimised, that luxuries shall be taxed rather than necessities, and so on. The use of the word "taxation" for the levying of rates and charges by private undertakings should perhaps be justified. Theoretically of course the power is of too important, it might almost be said of too imperial a nature, to be left in the hands of private persons that they may use it for their own private gain. The strong analogy, therefore, between railway rates and taxation evidently forms ample theoretic justification for stringent state control. At the same time, half a century's experience enables us to say *a posteriori* that the railway taxation of private companies is not levied in a different or more oppressive manner than that of state administrations.

Another analogy with taxation cannot be left unnoticed. As the great services of a country, the army, the navy, the civil service, and so on, are provided not for any one section of the community but for the benefit of all, so the vast bulk of railway expenditure—the whole, namely, of the capital outlay and the larger part of the working expenses—is provided for the benefit of the traffic as a whole, and not for any particular portion of it (see Taussig, "Contribution to the Theory of Railway Rates," *Quarterly Journal of Economics*, July, 1891; and Acworth, "Theory of Railway Rates," *Economic Journal*, September 1897). Yet further, even if we could tell the actual cost of working, say, an individual train from London to Edinburgh, we are as far as ever from knowing what it costs to carry each passenger, for the train cost is practically the same whether ten of them are carried or two hundred. A demand for rates based on cost of service is then a demand for what cannot be given, and for what, if it could be given, should in the public interest be refused. It may be added that a demand for equal mileage rates, sometimes assumed to be a demand for cost of service rates, is in fact a demand for something quite different. For wide as are the divergencies between existing ton-mile rates, the divergencies of the actual cost of carriage per ton per mile under different conditions are immensely wider.

We can only here enumerate the special economic problems affecting railway management. One of the most important for us in England at this moment is the question of exceptionally low rates for import, export, and transit traffic. All countries have specially low export rates, and transit rates likewise if

their geographical situation be such that they are thereby enabled to direct on to their lines any important international traffic. As for special import rates, when they have been abolished, as they have been recently, except in very special circumstances, both in France and Germany, they have been abolished as part of an avowedly protectionist policy. So far, moreover, are they from being a characteristic vice of private railway management that they scarcely exist in the United States, while the excess of ordinary domestic rates over import rates has perhaps nowhere been more marked than on the government railways of our own colony of Victoria. A problem almost purely economic is the question of the ratio which the rates for wholesale quantities, say train loads or truck loads, should bear to the rate for small consignments. Should there be any difference? If so, should it be roughly equal to or more or less than the difference of cost to the carrying railway? In other words, is it in the public interest to encourage economical methods, even at the risk of concentrating trade in but few hands? English and American courts, interpreting a practically identical law, have taken diametrically opposite views upon this point. Or again, how far is the apparent injustice—apparent only, for obviously in certain cases there is no injustice at all—of charging £1 for 200 miles and only 15s. if the railway is permitted to carry the goods 100 miles further along the same road, so offensive to the instinctive sense of justice of the ordinary plain citizen as to entitle the legislature to prohibit any such practice outright. The "long and short haul clause" of the American Interstate Commerce law has practically broken down. Is it best to forget it or to try and refurbish it for future use? Or again, take the question of "group" rates. How far is it justifiable for the sake of simplicity and uniformity to charge the same rate, say from the Barnsley group of collieries to Hull for shipment, though the percentage variation in distance be considerable? In other words, has a trader what he sometimes terms "a natural right to his advantages of geographical situation"? If so, how did he get this right, and is he entitled to maintain it even though the public interest should lie in the direction of new competition compelling him to reduce his prices? Or once more, in early days in England firms of carriers acted as intermediaries between the railways and individual traders. As far at least as retail traffic is concerned, the "express" companies in America and the *Spediteure* in Germany hold the same position still. Which system is most in the public interest? It may be assumed that the English system does the work cheaper and more promptly. Is this gain counterbalanced by the extra weight thrown into the scale of the already too powerful railway organisation? These are

only a few of the questions of great practical importance urgently in need of treatment by impartial persons in a scientific spirit.

A more important question is that of "pooling" and combination on the one hand, and of competition on the other. How far is competition, (a) in charges, (b) in facilities, in the public interest—a question on which much has been written *a priori*, but which now seems ripe for solution by the more fruitful method of induction from experience? In England, public authority, which has at times interfered—now to promote and now to forbid competition,—has in the main stood neutral. On the Continent, pools are a matter of course, equally whether the railways be in public or private hands. In America, congress interfered for the first time in 1887 by making every COMBINATION in the nature of a Pool illegal and penal. The house of representatives in 1894 passed a bill repealing this prohibition, but it failed to pass the Senate. Nor has it become law up to the time of writing (1898). Further, the Supreme Court, by its decision in what is known as the Trans-Missouri case, seems to have laid down that all railway combinations are illegal not only under the Act to regulate commerce, but also under the Anti-Trust law. In the interval, that has happened which railway economists foretold at the outset. The public has suffered worse than before from the sudden changes, the unequal rates, the secret discriminations which congress thought to prevent. In addition, some 45,000 miles of railway property have become bankrupt and passed into the hands of receivers, one instance at least in which problems of railway economics can hardly be thought to lack either importance or actuality.

For the scientific study of these and other similar problems no provision whatever is made in England; and it may perhaps be added that English railway management, which in the early days, when all was rule of thumb and no fixed rules had been laid down, was undoubtedly the first in the world, already shows signs of suffering from the lack of it. For the railway profession of other countries not only has access to such scientific teaching, but knows how to profit by it. In America at all the leading universities—at Harvard, at Yale, at Columbia, the work is in the hands of well-known economists like Taussig, Hadley, and Seligman. The Leland Stanford University in California, the creation of one of the founders of the Union Pacific Railway, possesses not merely railway courses but a railway library, practically exhaustive of its subject. In England not only have we no railway library, but our ordinary libraries lack even the recognised text books on the subject. Nor are continental countries behind America. There are regular railway courses at the Prussian universities of Berlin, Bonn, and Breslau, at Vienna, and many places more. One of the most brilliant books on railway economics,

*Transports et Tarifs* (already cited), is based on a course delivered by its author, M. Colson, lately the permanent head of the railway department of the French ministry of public works, in the Paris *École des hautes Études Commerciales*. Nor are students of a lower grade neglected. In Buda-Pesth there is a railway school corresponding in rank to the upper classes of a *Realschule*. At Biel in Switzerland there is what might be called a middle class railway school; and similar schools exist throughout Russia, in Vienna, and even in our Australian colonies.

[The bibliography of the subject comprises unfortunately but few books in English, and even of these the valuable ones are not written by Englishmen. The following English works may, however, be cited as possessing at least an antiquarian interest: Fairbairn, *Political Economy of Railroads*, London, 1836, 8vo.—Lardner, *Railway Economy*, London, 1850, 8vo.—Morrison, *English Railway Legislation*, London, 1848, 8vo. For a general survey of the whole subject the following American books may be recommended:—Hadley, *Railroad Transportation*, New York, 1886, 8vo.—Adams, *Railroads, their Origin and Problems*, New York, 1888, 8vo.—Fink, *Reports and Testimony before Legislative Committees on the Subject of Railroad Transportation*, New York, various dates, 8vo (a volume of pamphlets collected by their author, but not published). For English railways in particular the reports of the royal commission of 1865-67, the joint parliamentary committee of 1872, the House of Commons committees of 1881-82, the board of trade commissioners of 1889-90, the parliamentary joint committees of 1891-92; the House of Commons committee of 1893, contain a mass of information. On the special railway rates controversy of the last ten years, the traders' side of the case will be found in Buckingham Pope, *Railway Rates and Radical Rule*, London, 1884, 8vo, and Waghorn and Stevens, *Railway and Canal Traffic Act*, 1888, Report, Manchester, 1890, folio; the railway answer in the works of Grierison, *Railway Rates, English and Foreign*, London, 1886, 8vo; and Acworth, *The Railways and the Traders*, London, 1891, 8vo. Much fuller than the English railway literature is the foreign literature about English railways. Of German works there may be cited those of Cohn, *Englische Eisenbahnpolitik*, Leipsic, vol. i. 1874, vol. ii. 1875, vol. iii. 1883, 8vo.—Reitzenstein, *Verwaltungseinrichtungen und Tarifwesen auf den Eisenbahnen Englands*, Berlin, 1876, 8vo.—Schwabe, *Das Englische Eisenbahnwesen*, Berlin, 1871, 8vo; and *Neue Folge*, Vienna, 1877, 8vo; and Kemmann, *Der Verkehr Londons*, Berlin, 1892, folio. Among French books those of Franqueville, *Du Régime des Travaux Publics en Angleterre*, Paris, 1875, 4 vols., 8vo; and Malézieux, *Les Chemins de Fer Anglais en 1873*, Paris, 1874, 4to. Quite recently a pupil of Professor Cohn, Dr. Moritz Kandt, has published the first part of a history of Australian railways from the economic standpoint, *Australische Eisenbahnpolitik*, Berlin, 1894, 8vo. Of works dealing with special subjects the following should be mentioned. On the whole question of state ownership the report of the Italian commission of 1881

(*Atti della Commissione d'Inchiesta sull' Esercizio delle Ferrovie Italiane*, 7 vols.) is the leading authority. Some portion of it has been translated into French, Paris, 1882, 1 vol. 8vo; while a summary is given in the *Revue des Deux Mondes* for 1st and 15th July 1884. There are three recent English books on the subject, none of them unfortunately of much scientific value—Waring, *State Purchase*, London, 1887; Hole, *National Railways*, London, 1895; and Edwards, *Railway Nationalization*, London, 1898. French railways have been exhaustively treated in the monumental volumes of Picard, *Les Chemins de Fer Français*, Paris, 1884, 6 vols. 8vo. In reference to goods tariffs the works of Ulrich, *Das Eisenbahntarifwesen*, Berlin, 1886, 8vo (published also in French under the title of *Traité Général des Chemins de Fer*), and Launhardt, *Theorie der Tarifbildung der Eisenbahnen*, Berlin, 1890, 8vo, may be cited as of importance. In reference to passenger traffic the works of Ulrich and Perl have already been mentioned. Considère's controversy with Colson on the economic value of light railways also deserves particular notice. And no list can omit mention of Picard's great *Traité des Chemins de Fer*, Paris, 1887, 4 vols. 8vo; or of Roll's exhaustive *Encyclopédie des gesamten Eisenbahnwesens* (7 vols., Vienna, 1890-95), to which may be added, besides the works of Cohn and Sax already cited, an earlier work of Sax, *Oekonomik der Eisenbahnen*, Vienna, 1871. Those who require a fuller bibliography will find the leading works mentioned at the head of the different chapters in Hadley's *Railroad Transportation*; a very long but somewhat inaccurate list of titles in Charpentier et Maury's *Traité Pratique des Chemins de Fer*, Paris, 1894, 3 vols. 8vo, in the main a legal work; while the best bibliography of all is prefixed to the work of Dr. Moritz Kandt on Australian railways which is cited above.]

**LIGHT RAILWAYS.**—A light railway can only be defined from the technical standpoint as a railway inferior, whether in speed, cost, carrying capacity, or equipment to an ordinary railway. Legally, since the passing of the Light Railways Act 1896, it can be defined as a railway sanctioned not by a special act of parliament but by an order of the Light Railway Commission, approved by the Board of Trade. Continental countries have long classified their railways according to importance and standard of construction and equipment. Prussia has *Hauptbahnen*, *Nebenbahnen*, and *Kleinbahnen*. Elsewhere in Germany the expressions *Secundär*, *Tertiär*, and *Vicinalbahnen* are also used. France distinguishes between *chemins de fer d'intérêt général* and *d'intérêt local*. Belgium calls the latter class *vicinaux*. In all these countries the light lines receive pecuniary assistance from the state, but the state refrains, as far as possible, from direct interference in their management. In Prussia, where the *Hauptbahnen* and *Nebenbahnen* are practically all worked by the state, the *Kleinbahnen* are worked by contractors, sometimes individuals, but more usually companies. In France, where the lines of general interest are controlled by the minister of public works, the lines of local interest are under the control of the prefect of the department in which they are situated. In Belgium the state railway administration has nothing to do with the vicinal lines, which are built and controlled by a national society in which practically the only shareholders are the state, and the provincial and communal authorities, while the actual working is in the hands of local contractors.

Apart from the fact already mentioned that the Light Railways Act of 1896 permits railways to be made and land to be acquired by compulsion for the purpose on the authority of a non-parliamentary tribunal, the chief interest in the Act, from the economic point of view, lies

in the fact that it extends to Great Britain the policy which in Ireland has been in force at least since 1883, namely, that the central government and the local authorities should combine to render financial assistance to the construction of light railways. The Act provides that the treasury may assist either with gifts or loans, and that the local authorities of a county, borough, or district may not only lend money to, or subscribe for shares in a Light Railway Company, but may, if they prefer it, construct and work the line themselves. Up to the end of 1897 about ninety schemes involving the construction of over 800 miles of line had been submitted to the light railway commission. In no case has a local authority so far appeared as promoter. Four schemes have been actually passed, seven others have been forwarded by the Commission to the Board of Trade. So far as can be judged at present, light railways are likely to be made in most cases by private enterprise, largely that of the existing railway companies, unaided either by the treasury or the local authorities.

[Thompson, *Catalogue of Books and Articles relating to Light Railways*, London, 1895, 8vo, is a useful bibliography of the subject.] W. M. A.

**RAILWAYS (FRENCH).** The railway system in France is based on concessions for limited periods, after which the lines revert to the state, which has also a right of purchase on specified conditions. The state contributes to the cost of the lines by works, subventions, or by payment of interest on capital expended by the companies. During the first period of railway enterprise, 1823 to 1832, five perpetual concessions were granted for industrial lines in the centre of France, with animal-traction, for transport of coal and other merchandise. One of these, that from Saint-Etienne to Lyons, was the first to organise in 1832 a passenger service with locomotives. The line from Paris to Saint-Germain, commonly regarded as the pioneer railway in France, was only conceded in 1835 and opened in 1837. It was, however, the first railway having its terminus in the capital. In 1835 the government foresaw the future importance of railways from a national standpoint, and M. Thiers, then minister of commerce and public works, obtained from parliament a credit of 500,000 francs for studies on the conditions and mode of construction of railways in the future. The government had already received applications for concessions of lines from Paris to Rouen and Havre, and from Paris to Lyons and Marseilles. The inquiry was afterwards made to include lines to the Belgian frontier, Strasburg, Orleans, Bordeaux, and Nantes. No one of the projected companies was, however, able to execute the entire work of any of those lines, but a number of concessions were granted, and it was only twenty years later that those and other isolated lines, constructed in the interval, were grouped into the six present great companies, named the Northern—Eastern—Western—Paris, Lyons, and Mediterranean—Orleans—Southern, the terms of all the separate concessions being extended to a uniform period of ninety-nine years. No new perpetual concessions had been accorded since 1833. The general bases adopted for the construction of

railways were, that the ground should be provided by the state, aided by the departments interested; the permanent way, bridges, viaducts, and tunnels be executed by the state, the Companies contributing a fixed sum per mile; the rails, stations, and rolling stock to be at the charge of the companies; the passenger and goods rates to be fixed by the act of concession; the state to share the net profits above a certain dividend after provision was made for the redemption of capital during the period of the concession, at the end of which the lines were to become the property of the state, which would have to take over the rolling stock, plant, stores, etc. at a valuation. If the net profits were insufficient for the dividend and amortisation, the state engaged to advance the difference as a loan at 4 per cent, simple interest, to be repaid before the dividend could be increased, and if not reimbursed at the expiration of the concession, the amount to be deducted from the value of the rolling stock. The companies are bound to perform various services gratuitously for the state, including the transport of mails, troops, prisoners, excise and customs agents, to carry government stores at reduced rates, to permit telegraph wires to run along their lines and buildings, etc. The state also reserved a right of purchase after a period of fifteen years from the opening of the lines. The usual conditions are payment of the cost of the sections that have not been in working for fifteen years, for the rest the state would pay during the remaining years of the concession an annuity equal to the average net receipts of the last seven years, abstraction made of the two most unfavourable years of the period. The rolling stock taken over would have to be paid for within three months. The government have not yet exercised the right of purchase of the systems of any of the great companies, whose concessions only expire between the years 1950 and 1960. Their lines form a total of 20,499 miles of the 25,535 miles open (March 1897). There is, however, a network of 1744 miles of state lines formed by the purchase of a number of unproductive independent lines in 1885, some of which were then incorporated in the Northern, Western, and Orleans systems with which they competed, those companies transferring to the state other lines in exchange. The government had taken over those lines for political motives; their receipts did not cover their working expenses, and their suspension would have caused dissatisfaction among the populations they served. Those state lines cost the government £33,000,000, and the net revenue after more than twenty years of state management is only one-half per cent on the capital, which was borrowed at 4 per cent. The remaining 3292 miles of French railways consist of small independent companies or local lines con-

ceded by the communes or departments. The arrangements between the state and the great companies have been frequently modified by conventions, the most important of which were those of the years 1859 and 1883. By the former the companies undertook to construct a number of secondary lines on the state guaranteeing a net revenue of 4.65 per cent for interest and redemption, but only as a loan to be reimbursed when the new lines realised profits. The latter was concluded when government found itself unable to carry out M. de Freycinet's great scheme put forward in 1878 to construct 6250 miles of railroad in ten years at a cost of £120,000,000. Some of the projected lines, generally in thinly-populated regions, were abandoned, the others were distributed among the great companies, which undertook to execute them progressively on certain conditions. The capital raised by the six companies down to the end of the year 1896 was £59,955,000 by shares, and £474,473,925 by debentures, together £534,428,925, the whole of which will be paid off by drawings by the expiration of the concessions. The value of the lines, exclusive of the part contributed by the state, was estimated in 1892 by Mr. A. Neymarck, a president of the Paris Statistical Society, at £640,000,000. French writers frequently find a consolation for the large amount of the national debt in the provision that the value of the railways when the leases fall in will be probably sufficient to wipe out the debt completely.

[Alfred Picard, *Les Chemins de Fer Français*, 6 vols.—Duvergier, *Collection des lois et décrets de 1788 à 1897*; *Les Compagnies des Chemins de Fer*, papers by Mr. Alfred Neymarck read before the Paris Statistical Society (Paris, Guillaumin et Cie.)]

RAILWAYS, STATE. See RAILWAYS.

RALEGH, SIR WALTER, sometimes RALEIGH (1552-1618). Raleigh's economic writings were part of his work as an active politician. He wrote in jealousy for his native land in view of the political expansion of Spain and the commercial prosperity of the Netherlands. His tracts and his speeches in parliament, as reflecting if not outstripping his age, contribute to its economic history. If, in his *Discourse of War* and his *Discovery of Guiana*, he discusses, as other economists were doing, the capacity for indefinite multiplication in a growing population, and urged colonial enterprise, his chief object, *pace* private ambition, was to secure for England sources of "Indian gold," such as gave Spain the power to initiate and sustain her policy, and to hold which might "at least be a let or impeachment to the quiet course and plentiful trades of the Spanish nation" (*Guiana*). In his *Discourse of Seaports* he urged the construction and preservation of harbours, especially at Dover,

predicting that "the quick uttering of commodities which always followeth by increase of intercourse will cause all the coast and shire to be notably manured and peopled—not with poor, idle, but painful and rich persons." By a harbour at Dover we could both ourselves export Kentish corn and beer, and, by fixing a staple, serve the Channel shipping with commodities. But we were, it seems, too intent on reclaiming land on the Cinque Ports coast. The tract, *Observations touching Trade and Commerce with the Hollander, etc.*, included in Ralegh's works, is by some attributed to John Keymer, a Cambridge vintner. In it the wealth of the Dutch, despite their barren soil, is ascribed to (a) their leaving trade relatively free; (b) their pushing ability in "opening the gap of traffick"; (c) the storing of corn by merchant staplers, the minimum reserve at Amsterdam being 700,000 qrs.; (d) their great fishing fleet, we being content to buy of them fish caught off our own coasts. His statistics as to this fleet have been shown to be greatly exaggerated. His *History of the World*, the product of his imprisonment in the Tower (1603-16), reflects his character in greatness of design and imperfection of execution.

In his speeches he advocated liberty of the subject, as against such prescriptive legislation as the Statute of Tillage and the Bill for Sowing Hemp, leaving it to the peasant's discretion to grow corn or not. Nevertheless, when monopolies were attacked, he defended, as warden of the stannaries in Cornwall, his own patent, which prohibited the export of unmelting ore from the duchy, maintaining that by its protection the miner, instead of earning a maximum of "2s. a week, finding himself," now received a fixed wage of 4s. weekly. On one occasion of voting subsidies against Spain, he opposed a motion for taking a census as a basis of assessment on the ground that it would often reveal beggary "where is estimation of wealth," whereby the credit of such persons, "which is now their wealth, would be found nothing worth." On a subsequent similar occasion he held it injustice to assess as far down as "three pound men," when the estates of wealthy men were "not set down in the Queen's Book" at the hundredth part of their wealth. "Call you this *par jugum* when a poor man pays as much as a rich?"

[*Works*, London, 1751.—D'Ewes, *Four Last Parliaments of Queen Elizabeth*.—Edwards, *Life of Ralegh*, 1868.—M'Culloch, *Source and Valuable Tracts on Commerce*.] C. A. F.

RAMOS, ENRIQUE. See MUÑOZ.

RAMSAY, SIR GEORGE, Bart. (19th century), wrote economic, ethical, and political discourses.

Among these the one of most economic importance is his *Essay on the Distribution of Wealth* (Edin., 1836, 8vo), an attempted supplement, the

author tells us, to the works of Ricardo and Mill, whose labours in this field—of profits and the distribution of wealth—were, he thought, incomplete. The author opens the matter by inquiring into the causes which determine what portion of the whole produce of industry shall go to the labourer, that is, the causes determining the rate of wages, which he finds varies directly as the demand, and inversely as the supply. He quotes and advocates the Malthusian doctrine of the advisability of restraining population, refutes the Ricardian theory of the natural price of the commodity labour as that "which is necessary to enable labourers one with another to subsist and perpetuate their race without either increase or diminution." He denies that labour is a commodity, or that, as according to H. F. STORCH, it has a "Prix nécessaire," below which it cannot fall. He argues that the labourer will take any pittance "provided he can get no more."

In ch. iii. Ramsay discusses gross profits, or the circumstances which regulate the share of the master-capitalist.

Ramsay is distinctly on the side of labour as opposed to capital, and points out that where profits arise from an improvement in the productive powers of labour and capital, the commonwealth at large benefits, but where individual profits are due to the fall of wages,—though the individual may obtain an advantage, the nation is injured in its most numerous class (p. 144 *et seq.*). In this chapter on gross profits, Ramsay points out very clearly how the rate of profit falls in consequence of diminished productiveness. He carefully avoids the fallacious doctrine of a general rise in value, and, while agreeing with Ricardo as to the question of profit being entirely one of proportion, he finds fault with him for not taking into calculation that part of produce necessary for replacing fixed capital. He next criticises Ricardo's peculiar use of the term "wages," by which he understands the labourer's proportion of the whole produce. He (p. 181) objects to Adam Smith's explanation of the comparative proportion of profits in Europe; and censures (p. 182) Storch's theory that the master or capitalist, after paying rent and wages—is dependent for his profit on the sale of his commodity.

Ch. vii. deals with rent, which Ramsay insists is in its origin the effect of a high price of agricultural produce, not the cause. Chs. viii. ix. x. and xi. treat of the division of landed property, with its economic, political, and moral consequences; and ch. xii. is devoted to the subject of the national revenue, which he defines as "that portion of the annual gross produce of any country which either is actually employed in satisfying immediately the physical wants of its inhabitants during the course of a year, or which may be so employed without at all impairing the sources of national wealth."

On p. 496 he quotes Malthus's prophecy that the U.S.A. will one day manufacture their own raw produce, and he applies this to our own industries, in which he observes, with a foresight which events have justified, other nations will compete with us. Ramsay's intelligence on the free-trade question was, however, not great, as at

the close of this very chapter we find him deprecating the abolition of the corn laws, insisting that the possible good derived from the cheapness of corn would scarcely be sufficient to "induce the legislature to create so great a present evil."

Other works by Ramsay are:—

*A Disquisition on Government*, Edin., 1837, 8vo.—*Political Discourses*, Edin., 1838, 8vo.—*An Enquiry into the Principles of Human Happiness and Human Duty*, Lond., 1843, 8vo.—*Instinct and Reason as the First Principles of Human Knowledge*, Lond., 1862, 8vo. A. L.

RAPER, MATTHEW, elected F.R.S. in 1754, his name disappears from their lists in 1778.

He made four contributions to the *Philosophical Transactions*, the last of which—*An enquiry into the value of Greek and Roman Money*, 1771, republished 1772, and by the Political Economy Club with preface by McCulloch in *A Select Collection of Scarce and Valuable Tracts on Money*, 1856—was the most important English contribution to the subject between Greaves, 1647, and Hussey, 1836. The latter's *Essay*, pp. 8, 68, 221, praised it none too highly, but most of its results have been superseded by the discoveries of inscriptions, etc., referred to by Büchli, *Metrolologische Untersuchungen*, 1838; Brandis, *Das Münz- Mass- und Gewichtswesen in Vorderasien*, 1866; Schillbach, *Beitrag zur griechischen Gewichtskunde*, 1877, and Mommsen's, Lenormant's, and Hultsch's well-known works. His error as to the libra was only '633 per cent.

[Sir W. Smith, *Dictionary of Greek and Roman Antiquities*, 1891, sub tit. "Pondera."] J. D. N.

**RAPIDITY OF CIRCULATION.** This phrase is used in dealing with the theory of money to express the fact that in a community in which the use of money is habitual, in order to effect the number of exchanges of commodities required by the community, each piece of money passes from hand to hand many times, representing a fresh purchase on each occasion. Though it is not essential to contemplate this fact in relation to a given period of time, yet as our habit in considering commercial transactions is to look to their annual amount, the idea embodied in the phrase, "rapidity of circulation," becomes clearer if it be stated that the rapidity of circulation of a piece of money is the average number of times it changes hands in the course of the year. MILL's insistence that "time is not the thing to be considered," *Princ.*, bk. iii. ch. viii. § 3, only made the idea more difficult to grasp. LOCKE certainly saw the real office of "quickness of circulation," and the basis of the true theory (see LOCKE ON CURRENCY). The significance of that idea gradually became apparent through the investigation into the quantity of money required by a community. The old opinion was that the aggregate amount of the money in a country at any time was equal to the aggregate of all commodities then and there for sale. Sir William PERRY, in 1682, understood the subject better than many

who followed him. BERKELEY, in 1735, tersely put the truth, that "a sixpence twice paid is as good as a shilling." BANDINI, in 1737 (*Discorso Economico*, pp. 41 *et seq.*), saw the same truth. It was not till much later that the effect of the circulation of money was thoroughly comprehended. SISMONDI in 1820, *Nouveaux Principes*, v. 11, and elsewhere, wrote that "the amount of medium in circulation in a state must be equal to the sum of the payments made in it in a given time, divided by the sum of the times the former has on an average changed owners." It became generally understood that a piece of money did its work several times over for different persons in respect of different purchases, and most writers by 1850 had definitely adopted the phrase under discussion. ROSCHER, for instance, in dealing with the amount of money needed in a community, makes it depend on (1) the number and extent of transactions; (2) the rapidity of circulation; and adds that one coin, circulating ten times a year, is equal to ten coins of the same denomination which go from hand to hand once a year. J. S. MILL discusses rapidity of circulation from the point of view of the purchasing power of money.

The practical question is whether any such estimate can be made of the work done by each piece of money, in any given community, as to indicate the quantity of money required by the community. Knowing what the phrase connotes, is it possible to formulate its effect for practical use? Such an inquiry is hopeless. The factors to be dealt with are so numerous, ill-defined, and illusive, that it is impossible to evolve a formula which the mind can conveniently carry. The different denominations of coins, the different habits of mind of the persons handling the coins, the different commodities to be exchanged—all affect the inquiry. Consequently the supply of the circulating medium to a community remains purely empirical; and, so far as theory goes, we have never got much beyond Sir William Petty's suggestion, two centuries ago, that the money required in circulation in England was equal to half the amount of the ground rents (paid half-yearly) +  $\frac{1}{4}$  the amount of the house rents (paid quarterly) +  $\frac{1}{12}$  part of the wages (paid weekly) +  $\frac{1}{4}$  the value of all exported commodities.

Such considerations as the effect of hoarding, the absorption of coin as ornament on the person, as happens with the coolie women of India, the greater rapidity of circulation in cities than in thinly-populated areas, are of no real assistance in determining the actual numbers of the purchases made by each coin, or even of each sovereign's worth of coin in circulation. So far as their extent is known they furnish an element in the adjustment of the amount

of coin to be issued annually in any given community.

The development of banking facilities and clearing-house arrangements has in modern times made the actual working of the circulation much clearer.

[Roscher's *Political Economy* (Lalor's translation), § cxxiii., vol. i. pp. 367-69, and note on p. 368. — Sismondi, *Nouveaux Principes*, bk. v. ch. ii. — J. S. Mill's *Principles*, bk. iii. ch. viii. § 3; ch. ix. § 3. — Sidgwick's *Principles*, p. 238.] C. A. H.

RAPP, GEORGE (1770-1847), founder of the sect known as *Economites*, was a native of Württemberg, where he made his first effort to bring back society to the principles of early Christianity. Failing in this, he and his followers emigrated in 1803 to western Pennsylvania. A settlement called Harmony was established, and Rapp's followers were known as Harmonites. In 1815 the community removed to Indiana and founded New Harmony. Again failure attended these religious socialists, and the settlement was sold to Robert OWEN (*q.v.*) in 1824. An experimental community was formed on Owen's system, but this also failed in the course of three years. Meanwhile Rapp and his disciples returned to Pennsylvania, and built a new settlement, on the right bank of the Ohio, called Economy, where they employed themselves in farming. Rapp's leading doctrine was the speedy second coming of Christ; to prepare for this his object was to amass as much wealth as possible. He enjoined the most rigid economy both on himself and his followers. They laboured strenuously, practised celibacy, and had all things in common. In course of time the community became extremely wealthy, possessing large farms, dairies, and vineyards, and it was reported to hold many millions of dollars' worth of railway and bank shares. When Rapp died in 1847 the community numbered several hundreds, but it gradually dwindled away until there were not a hundred survivors at the United States census of 1890.

RATE. A rate is defined in Sweet's *Law Dictionary* as "a sum assessed or made payable by a body having local jurisdiction over the district in which the person on whom the rate is assessed dwells or has property." A rate may thus be said to differ from a tax in being a local or municipal, not a national or imperial, imposition. It is always levied directly, and usually on immovable property. What public expenses should be met out of rates rather than out of taxes will depend in the first instance on the apportionment of functions between central and local authorities. Thus in England the relief of the poor has been charged upon the rates. But the expenses of a branch of

administration which has been left to local authorities—as primary education, may be defrayed in whole or in part from the national treasury. Such grants in aid of the rates have been growing in number and importance of late years. They are open to the objection that they tend to relax the economy of local authorities. The term "rate" is commonly but inaccurately applied to the charges made by gas and water companies for the commodities which they supply.

[Castle, *On Rating*. — Palgrave, *Local Taxation*; — Town Holdings Committee, 1886-88. — Goschen, *Reports and Speeches on Local Taxation*.]

F. C. M.

RATE; RATES, INCIDENCE OF. Rate means proportion, being levied in proportion to the value of the property subject to the rate. Thus customs used to be regulated by a royal (1556) or statutory (1660, 1724) "book of rates," and modern statutes still sometimes refer to customs as "duties and rates." Nowadays, however, rates are almost invariably opposed to duties and taxes; and the line of cleavage is rightly defined by Mr. Cannan as follows: when the taxing authority requires a lump sum payable by contributions in certain proportions, this is a rate; when it requires sums from certain persons or on certain occasions, this is a direct or indirect tax. From 1834 and onwards FIFTEENTHS AND TENTHS were in this sense rates; so are modern French "contributions foncières et mobilières." But there is this difference between England and France: in France local are added to central "contributions," or else consist of OCTROI; in England all local imposts are rates—no central imposts are rates except the LAND TAX, which is raised by "a pound rate." Hence, popular language dubs all imposts by a non-sovereign body, rates, and all imposts by a sovereign, or like a colony, quasi-sovereign body, taxes, customs or excise. The earliest local rates were the "scot" (see SCOT AND LOT), "town-ley," or "constable's tax," payable by members of a township "juxta facultates," and often including the hundred and county rates. Side by side with this was the church parish rate virtually abolished in 1868. But a new system grew up of imposing separate rates for separate objects—such as sewers (1427), bridges (1530), and gaols (1531)—which culminated in the poor-rate of 1572, 1598 (Thorold Rogers, *Hist. of Agr. and Prices*, vi. 101), and 1601; and the poor-rate soon became the pattern after which every local impost was remodelled. The modern history of local rating begins therefore in 1601.

Modern rates, such as (1) the general, and (2) special county rates, in which the hundred gaol-fees, shirehalls, asylums, and, since 1888, county police rates are more or less completely merged; (3) the borough, and (4) borough watch rates; (5) general, and (6) special

district-rates of (a) town councils, urban improvement commissioners, or in London county vestries, and (b) rural district councils under the Public Health Acts, etc., of this reign; (7) general, and (8) special parish council rates; (9) sewers, lighting, police, and general rates in London county; such (10) highway, (11) lighting and watching, (12) baths, and (13) library, (14) burial board, and (15) education rates as are not swallowed up in the preceding rates, are all levied according to the annual value of property rateable to the poor rate, either in the same way as, or as part of, the poor rate. Not that there is uniformity. The county and borough, but not London county, rates may be based on independent valuations by their respective authorities—an absurd waste. Urban district rates are usually “made” by separate officers, other rates being “made” by the overseers. The main burden of special expenses is wisely cast on those who profit thereby; and there are anomalous exemptions from urban general district rates. Occupiers deduct from their rent three-fourths of private improvement rates (a special species of district special rate), and poor people often “compound,” i.e. the owners and not the occupiers pay rates; and these cases are differently defined in different acts. Many towns have private acts. Again, the distinctions of rate and rate are artificial. Highway rates have been split up, and part has become county and part district rates. District rates belong in the country to the poor rate, but are usually separate in boroughs, and sometimes the poor rate swallows up the borough rate, which, again, swallows up sometimes the watch rate, and sometimes the general district rate. Finally, there survive (16) sewers rates (1531) (1861), (17) general sewers tax, (18) drainage rates, and (19) a few highway rates leviable by way-wardens which have nothing to do with poor-law machinery.

Under the act of 1601 poor rates were levied (1) by overseers, including churchwardens; (2) on every parochial inhabitant, and (3) occupier of (4) lands, houses, tithes, (saleable) underwoods, and (coal) mines; (5) according to the ability of the parish. We will take these points in order: (1) In 1894 in rural parishes churchwardens were deprived of this office, and the other overseers, formerly nominees of the magistrates, were made elective, and the local government board may extend similar provisions to towns. Up to 1834 the overseers, since then the guardians, decide how much must be raised for the coming year. The overseers prepare the valuation list, which, since 1862, is corrected and countersigned by a committee of guardians called “The Union Assessment Committee,” and then becomes official. They then “make” the rate, i.e. state that “A. B. being assessed at so much,

must pay so much in the £”; and two magistrates “allow” the rate—a mere form. Since 1744 the rate must be published; since 1836 a prescribed form is followed. An appeal lies to special petty and to quarter sessions. Non-payment entails a magisterial distress-warrant against chattels, or, if there are no chattels, three months’ imprisonment. Paid collectors have during this century been appointed by the guardians; formerly the overseers were collectors. (2) and (3) The local unit is the parish, but the township is largely substituted in the north under an act of 1662. Unlike most sewers and drainage rates, and the private improvement rate, the poor rate—though classed by economists as a land tax (Sir R. Giffen, *Essays in Finance*, ser. i. p. 252)—is personal, and does not charge land. (2) In the south and west of England “local, visible, and profitable” personalty was assessed to the poor rate, a practice which the courts finally sanctioned (1795). Here, too, the worst abuses of poor relief began and culminated (1795). About this time the old staples and clothiers migrated from the west of England to Yorkshire. These three facts were probably connected; the poor law commissioners ascribed the third to the first two; but Massie mentions the high price of coal and necessities, Tucker (*Instructions for Travellers*, 1757, p. 25) and the Select Committee on Wool (1806) mention the bad organisation of industry in the west of England as the prime cause, and there were earlier migrations to Ireland and elsewhere. Since 1840 personalty may not be assessed; but the practice still varies as to machinery (Hansard, *Debates*, 1887; see Index s.v. “Rating of Machinery”). Poor-law rating according to “means and substance” prevailed in Scotland from 1579 to 1861; and shopkeepers often become overseers in order to pry into their rivals’ stock-in-trade. The highway rates which from 1654 to 1767 affected personalty were seldom levied. (3) “Occupier” excludes lodgers, servants and dwellers in empty houses, but applies to flats, colleges, charities, and hospitals. If the rent is less than £8, or, in London county, £20, the “Compound Householder” system prevails. In Scotland rates are generally thrown half on owners, half on occupiers; and in Ireland a similar system exists with regard to the poor rate, and agricultural and pastoral holdings. Advocates of this plan are referred to by Blunden (ch. vii.). (4) The words “saleable” and “coal” were struck out in 1874, and sporting rights were added. (5) There was no one plan of estimating the payer’s ability until 1836. Since then the overseers (i) estimate the rent which the premises would fetch if let to a yearly tenant free of tithes and tenants’ rates and taxes; (ii) and then deduct repairs, insurance, and renewal expenses—(i) is called

"gross estimated rental," (ii) "net rateable value": (i) is usually about 6 per cent less than the corresponding income-tax assessments, and (ii) usually knocks off another 15 per cent (see Blunden, p. 126). The following figures are from Mr. Fowler's *Report*. Expenditure of local authorities, excluding loan expenditure, was met (in round figures) thus:

RATES COLLECTED.			
	1888.		1902-3.
Urban	£3,027,000	Administrative County	
London	3,708,000	of London	£13,835,000
Rural	1,416,000	County Boroughs	14,443,000
Mixed	8,358,000	Other boroughs and	
		urban districts	14,585,000
Total	£16,504,000	Rural Districts	7,903,000
From Treasury	951,000		
Tolls, etc.	7,289,000	Total (England and	
		Wales)	£50,116,000
Total	£24,744,000	From Imperial Funds	12,787,000
		Total	£62,903,000

And local debts had risen from £92,820,100 (1875) to £370,607,000 (1902-3), £67,515,000 purely, £303,092,000 partly urban. Rates per £ were 3s. 10½d. (1817), 3s. 8d. (1827), 2s. 7d. (1841), 3s. 4d. (1868), 5s. 7½d. (1902-3).

The Agricultural Rates Act 1896, and Elementary Education Act 1897, are estimated to make the Treasury Subventions, 1897-98, £8,979,000 (see BETTERMENT).

[There are three classical *Reports on Local Taxation*, by the Poor Law Commissioners (1843), Mr. Goschen (1870), and Sir H. H. Fowler (1893) (who reprints the Report of 1870). See also G. H. Hobhouse, *Outline of Local Government and Local Taxation in England and Wales* (1894).]

**RATE IN AID.** Previous to the year 1834 every parish had to provide for the relief of its own poor. The rate in aid was a rate levied upon neighbouring parishes to assist a parish which was unequal to this burthen. The principle of a rate in aid was first introduced by an act of 1555 (2 & 3 P. and M. c. 5), but only with reference to parishes in the same city or corporate town. An act of 1597 (39 Eliz. c. 3), which amended and consolidated earlier statutes for the relief of the poor, enabled two or more justices of the peace dwelling in or near a parish alleged to be unable to maintain its poor, if satisfied of that inability, to lay a rate in aid upon other parishes in the same hundred, or upon individuals in such parishes. If the hundred were judged unequal to assisting the parishes which could not relieve their poor,

the quarter-sessions might levy a rate in aid upon any other parishes within the county. The celebrated act of 1601 (43 Eliz. c. 2) repealed the act of 1597, but re-enacted these provisions. Since the passing of the Poor Law Amendment Act 1834, the formation of unions of parishes, and the establishment of a common poor fund for London, has rendered the levying of rates in aid unnecessary.

**RAU, KARL HEINRICH** (1792-1870), born at Erlangen, studied in the university of that city, in which he became, 1816, an extraordinary, and, 1818, ordinary professor. In 1822 he accepted a call to the chair of political economy at Heidelberg, where in 1845 he was made a privy councillor. He was a member of the first Baden chamber, and was elected to the Frankfort parliament in 1848. He died at Heidelberg.

Rau was a follower of Adam Smith. At first, influenced by the older German economists, with whose writings he was thoroughly acquainted, he showed mercantilist tendencies and a leaning towards a protectionist policy, as well as an inclination in favour of a revived gild-system. But gradually, as he himself tells us, larger experience led him to change many of his opinions; he entered more and more fully into the views of Smith, and adopted the principle of freedom of trade and manufactures, though not with the rigour of the English school. He studied also the later English economists, and accepted the so-called Ricardian theory of rent. Early in life Rau inclined to the historical method, but he afterwards conceived the mistaken notion that that method dealt only with the past and did not concern itself with the improvement of existing conditions; and his interests became too exclusively practical.

Rau is not remarkable for precision of thought or strict accuracy of expression; his character is "erudite thoroughness." He interweaves with his abstract discussions many geographical and statistical illustrations. His writings are specially adapted for the use of public officials and members of the legislature, being very full on the application of theoretical principles to concrete cases. He was the economic teacher of the well-governed German middle states from 1815 to 1848, his doctrines having taken root among the liberal and enlightened civil servants of those states.

Among his most notable economic publications may be mentioned his early prize essay, *Über das*

*Zunftwesen*, 1815; *Ansichten der Volkswirtschaft*, 1821; *Malthus und Say*, 1821; and, above all, his *Lehrbuch der politischen Oekonomie* (1826-1837), which has appeared in many editions, and has been remodelled by Adolf Wagner and Erwin Nasse, the former doing much the greater portion of this work. Rau also gave in 1819 a free, but very good, translation of Storch's *Cours d'Economie politique*. He established in 1835 a periodical entitled *Archiv der politischen Oekonomie und Polizeiwissenschaft*, and conducted it, at first alone, afterwards in conjunction with Hanssen. A very large number of reviews and other papers by Rau appeared in the *Archiv*.

[*Leser in Allg. Deutsche Biogr.*—Lippert in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N. O.*, p. 847.] J. K. I.

RAUDOT, CLAUDE MARIE (1801-1879), born at Saulieu, Côte d'Or, died at Pontaubert, Yonne. He had been appointed a magistrate before the Revolution of 1830, but being a legitimist by conviction, he resigned in that year.

During the reign of Louis Philippe, Raudot published *La France avant la Révolution*, 8vo, 1st ed. 1841, 2nd ed. 1847), a faithful summary of the state of France when the *États-généraux* were convoked.

Elected a representative of the people in November 1848, Raudot was re-elected to the legislative assembly in May 1849.

The *coup d'état* caused him to return to private life. While he was in parliament he had published two works, which, like the first he wrote, were successful. The first of these was *De la décadence de la France* (4th edition, 1850), a sensational title which should not be taken literally. He desired to make it clear that France was strangled by the laws, but that these hindrances could be easily removed, and hence had made less progress than other countries. Administrative centralisation was the principal hindrance, and Raudot eloquently described the injuries it inflicted on France. His second work, the sequel and in some respects the complement of the first, *De la grandeur possible de la France*, 8vo, 1851, discusses, one by one, each of the public offices, and shows the reforms most required in each. Amongst these reforms decentralisation takes the first place. Even in the present day it would be well for the governing body of France, legislators and ministers alike, to study this work, one of great ability and much conscientious research. During the second empire Raudot published *Napoleon I<sup>er</sup> peint par lui-même* (18mo, 1865). This condenses the first fifteen volumes of the conversation and correspondence, official and otherwise, of Napoleon I., collected, classified, and republished by order of Napoleon III., and contains revelations startlingly suggestive of the baseness of the causes of the wars, particularly the wars of conquest so disastrous to France.

This work may thus strengthen the feeling of security among nations. A. C. F.

RAYNAL, GUILLAUME THOMAS FRANÇOIS (1713-1796). After having studied at the Jesuit College, he became a Jesuit himself and a parish priest in Paris, until he left the

church and began life anew as a man of letters.

His first works, all of them historical, are mere compilations and quite forgotten, but his *Histoire philosophique et politique des établissements et du commerce des Européens dans les deux Indes* (Geneva, 4 vols. 1770, 10 vols. 1781—first ed., without the author's name) made a great stir at the date of its publication, and was sentenced by the Paris parliament to be burnt by the public executioner. It is full of furious attacks on religion and existing institutions, written in a pompous and declamatory style, and provoked animosity from all quarters. Grimm stated that one-third of the book was the work of Diderot. Turgot was shocked by "its incoherence and by seeing the most opposite paradoxes defended with the same heat, the same eloquence, the same fanaticism. . . . He, the author, is more learned and has more natural sensibility and eloquence than HELVETIUS, but he is quite as desultory in his ideas, and as much a stranger to the true nature of mankind" (*Œuvres*, ii. p. 801). A passage from a letter of Horace Walpole to the Countess of Aylesbury (Dec. 20, 1772) conveys a lively picture of the contents of the book. "It tells one everything in the world: how to make conquests, invasions, blunders, settlements, bankruptcies, fortunes, etc.; tells you the natural and historical history of all nations; talks commerce, navigation, tea, coffee, china, mines, salt, spices; of the Portuguese, English, French, Dutch, Danes, Spaniards, Arabs, caravans, Persian, Indians; of Louis XIV. and the king of Prussia; of La Bourdonnais, Dupleix, and Admiral Saunders; of rice, and dancing women; of camels, gingham, and muslin; of millions of millions of livres, pounds, rupees, and cowries; of iron cables and Circassian women; of Law and the Mississippi; and against all governments and religions" (*Walpole's Letters*, vol. v. p. 421, edit. Cunningham). Raynal expressly boasts that he has consulted all available sources, and in his overbearing way exclaims at the outset: "I have questioned the living . . . and the dead . . . in whatever language they have written. . . . If a man living at the pole or under the line, and capable of informing me on some important point, had been pointed out to me, I would have repaired to the pole or the line and challenged him to tell me the truth" (vol. i. p. 3, edit. 1781). In fact he inserted whole pages taken from previous writers or histories without acknowledging his obligations.

Putting on one side literary faults and extravagant attacks on religion, this treatise *de omni re scibili*, had it been cut down to one-half of its size, would not have been a bad historical work; a good deal of sound criticism on colonial policy is to be found in its pages. Raynal dissents from the prevailing mania of pseudo-philosophical admiration for the Chinese, and most of the historical summaries are put in a plain and sensible way. As an economist, though he does not commit himself to absolute doctrines, he still shows a predilection for agriculture and industry, and ascribes the decay of Portugal to its neglect of the cultivation of its territory: "Enlightened

men frankly regretted the neglect of the real sources of wealth, as the tillage of the soil, in order to run after those glittering objects, the precious metals" (vol. i. p. 241). This passage shows that he did not belong to the older school of mercantilists.

E. CA.

#### READ, SAMUEL—

is best known by his *Political Economy, An Inquiry into the natural grounds of right to Vendible Property or wealth*, published at Edinburgh for the author, 1829, the preface being dated from Roslin, October 1829. He had before written (1) *On Money and the Bank Restriction Laws* (May 1816). (2) *The Problem solved in the explication of a Plan of a safe, steady, and secure Government Paper Currency and Legal Tender*, Edinburgh, 1818. (3) In his *Exposure of Certain Plagiarisms of J. R. McCulloch, Esq., author of two Essays on reduction of the interest of the National Debt, committed in the last published of those essays, the Scotsman newspaper and Edinburgh Review*, in recto decus, Edinburgh, 1819, he complained that McCulloch in the second of his two essays on the national debt (Nov. 1816) borrowed without acknowledgment from the above tract on *Money* (a) the general rule of adjustment, namely, that creditors accept the exact weight of bullion which would have been bought at the time of contract with the currency advanced then by them to the borrowers. In McCulloch's earlier essay the standard was not bullion but corn. (b) He borrowed the application to the stockholders, practically reducing the interest on the national debt. Read, in any case, was not followed by McCulloch in applying the principle to all debts, private as well as public. He had written also on population (see below).

"Political economy," he writes in the preface to his *Inquiry*, "has been hitherto designated as the science which treats of the production and distribution of wealth, and it has been totally overlooked that this includes the demonstration of the right to wealth. It is here, therefore, for the first time, treated as an investigation concerning the right to wealth or property." "Its chief object (Introduction, p. xviii) is to demonstrate what is just or unjust in all the most important and difficult points relating to the production and distribution of property or wealth; property, i.e. vendible or transferable property being the chief, if not the only subject of the virtue of justice;—political economy might indeed be called the science of political justice." But if we expect from this beginning a treatise on the lines of the *Inquiry concerning Political Justice* by W. GODWIN, we shall be disappointed. Read's book is mainly economical, and to a large extent orthodox. Godwin's view of inherited property is expressly rejected (pp. 121, 122) on the ground that labour by itself is far from producing all the wealth in existence; accumulated capital plays a part that cannot be ignored (p. 124). Read deals severely with *Labour Defended against the Claims of Capital* (anon., 1825) (pp. 125-132). He has little but praise for ADAM SMITH, but no praise for MALTHUS, against whom he had written a pamphlet, *General Statement of an Argument on the Subject of Population in Answer to Mr. Malthus's Theory* (Edinburgh, 1821). The

principle of population seems to him to be in no other sense the cause of poverty and misery among the lower classes of the people "than as that principle is the cause of their existence" (*Inquiry*, p. 158, cp. 158-170, and 55 n.).

Read follows Adam Smith in considering "labour the only certain measure of value" as well as the chief though not the only "ingredient in the cost of production" (p. 199). He attaches importance to the idea of an "absolute value," though this is, he admits, less an economic than a philosophical idea; it is "happiness itself or pleasurable sensation" (p. 229). He considers that the desire of bettering our own condition is resolvable into the preference of pleasure to pain (p. 146). The utilitarian standard is to be continually borne in mind (p. 229, cp. e.g. p. 362). The fact of appropriation ought also to be better remembered than it usually is; Read deduces from it that rent enters into price (p. 243), and he justifies by it his use of "vendible property" for wealth (pp. 19-21). He is certainly no assailant of the received rights of property; and thinks to place them more surely beyond attack by a poor-law system that would allow 4s. a week to the aged and infirm, and 3s. to the unemployed, in addition to the usual forms of relief (p. 361). Like recent writers, he considers that, since the land is no longer open to the labourer, the labourer out of employment has a very special claim on society (pp. 364-375). "The right of the poor to support, and the right of the rich to engross and accumulate, are correlative and reciprocal privileges, the former being the condition on which the latter is enjoyed" (p. 375).

Finally, in regard to taxation, Read's view is that there is a point up to which it acts as a wholesome stimulus to industry (p. 388), but the limit is easily overstepped, and was overstepped in the late war. "Those who are old enough to remember the state of the country and of the labouring classes before the commencement of the late war, can bear ample testimony to the fact that their hours of labour were not so long, nor their exertions so arduous as they became towards the conclusion of it, and that they gradually increased with the increase of the taxes" (p. 390 n.).

Read is by no means the worst of the minor writers on political economy who abounded in the first half of the 19th century; and it is to be regretted that the dictionaries of English biography give no information about him. J. B.

**REAL.** From 1497 to 1772 the principal Spanish silver coin was the piece-of-eight reals, which subsequently to the latter date became known as the dollar (see DOLLAR, HISTORY OF; DOLLAR, HARD).

In 1642 a "real of new plate," intended solely for use in Spain, and known as a "provincial" coin, was introduced. The circulation of these pieces, however, was not restricted to the provinces of Spain, but the coins were largely exported to America.

The weight and fineness of these reals are given by Chalmers in his *History of Currency in the British Colonies*, as follows :—

Date.	Weight.	Fineness.
1642	grains.	
1686-1707	42·59	931
1707	42·2	931
	47·3	833·3

F. E. A.

REAL ESTATE. See PROPERTY, Sec. vi., Real and Personal Estate; and REAL PROPERTY.

REAL PROPERTY is the property the beneficial interest of which in the case of intestacy in the United Kingdom passes to one person called the heir-at-law, who, if the deceased owner leaves any sons, is always the eldest son. It is distinguished from "personal property," which is divided among the next-of-kin (see INTES-TACY). Real property consists of freehold estates in land (see ESTATE; FREEHOLD), and certain rights called incorporeal hereditaments (see INCORPOREAL PROPERTY), e.g. advowsons. Leasehold interests in land are personal estate, as well as all movable property, stocks, shares, book-debts, etc. The legal interest in real property of persons dying after the 1st January 1898, by virtue of the Land Transfer Act 1897, passes in the same way as personal property. E. S.

REALISE. To convert a security into cash; also, in closing a bargain upon the stock exchange, to convert into a reality a profit or loss which is otherwise contingent upon quotations remaining unchanged. R. W. B.

REBATE. An abatement allowed in retiring a bill of exchange before maturity, calculated upon the number of days the bill has yet to run, and at the prevailing rate of interest, or at a rate decided by the custom of a special trade or place. In London it is now usually taken at one half per cent above the bankers' deposit rates.

Also, in bankers' book-keeping, an allowance in a balance-sheet for discount received upon bills not yet matured. In practice, rebate may be calculated either at a fixed or arbitrary rate, at the average discount rate for the last three or six months, at the rate of the day upon which the closing entries are made, or at the actual rate at which each bill was discounted (see also DISCOUNT). R. W. B.

RECEIPT. A written acknowledgment of the payment of money or of the delivery of goods. In the case of a ready-money transaction a receipt does not require a stamp, but where credit has been given, any written acknowledgment of the receipt of money or of a bill of exchange, or of a cheque or a promissory note or satisfaction of a debt, where the money, bill of exchange, cheque, note, or debt is £2 and upwards, requires an adhesive stamp of 1d. The obligation to provide the stamp is thrown on the person to whom the payment is made.

[Alpe's *Digest of the Stamp Acts*, 1896.]

J. E. C. M.

RECEIVER. Where it is desirable that property in dispute should be protected, or that income should be appropriated to satisfy a judgment, the court will appoint a receiver for the purpose. J. E. C. M.

RECEIVING ORDER. The name of the order made on the petition of a creditor or the debtor for the institution of bankruptcy proceedings. Its effect is to put the official receiver in charge of the debtor's property and to stay proceedings pending against the debtor (see BANKRUPTCY LAW AND ADMINISTRATION). E. S.

RECIPROCITY, as used by writers on trade, denotes a special class of trading arrangement between nations, which is limited by the grant of special advantages on one side in consideration of equal advantages given by the other. At one time the use of the term was so extended as to embrace a regular system of trade; at the present day it rather imports a principle which has its effect in special cases. The term first came into use in the early years of the century, in connection with the relaxation of the navigation laws of the United Kingdom, in return for similar relaxation of restrictions on shipping on the part of a foreign nation. The first application of this principle was in the treaty between Great Britain and the United States in 1815, which contains a clause to the effect that the ships of each of the contracting parties, on coming into the ports of the other party, should not be liable to any greater charges than the ships of that other contracting party were subjected to in the ports of the first. The action of Prussia in 1822 forced the hand of the United Kingdom into extending the same principle to our dealings with European countries. On 2nd April 1824, a convention was made with Prussia in which the principle of a reciprocal concession in regard to duties on tonnage was embodied (Hertslet's *Treaties*, iii. p. 313). The matter was taken up by HUSKISSON (*q.v.*), particularly from the point of view of the shipping interest, and the plan was then applied by treaty to the new South American states which had just declared their independence of Spain. Conventions during the immediately ensuing years were made with Buenos Ayres (2nd February 1825), Colombia (18th April 1825), France (26th January 1826), and Sweden (18th March 1826) (see Hertslet's *Treaties*, vol. iii.), and at the same time the principle was extended so as to apply to duties on imports.

This extension of the system to import duties suggested a new idea to certain economic writers, who conceived that the correct theory of international trade was to base it on reciprocal concessions, so that no nation would admit the goods of another on any given terms unless that other nation treated its commodities in an equally favourable manner. This is the idea

specially attached to the term "reciprocity" about the middle of this century, and its corollary was that retaliatory duties should be levied upon all countries imposing hostile tariffs on the national products. It found several adherents of note, and its claims are not unfrequently advocated in the pamphlet literature of 1840-50, but it made no headway in the face of the free-trade movement, and the act 12 & 13 Vict. c. 29, which embodied the principle of extending favours to foreign powers where those powers gave favourable treatment to British goods, carefully avoided any suggestion that such treatment must be a condition precedent to the grant of the favours.

The basis of the reciprocity theory is the idea that where two countries trade with each other to repeal an import duty in one while a high duty is kept up in the other is to make the first country, *pro tanto*, tributary to the second. It is put concisely in a letter from Col. TORRENS to Sir Robert PEEL.

"By a failure to oppose hostile tariffs with retaliatory duties we confer on foreign powers a bonus on the continuance of their restrictive systems, while by maintenance of retaliatory duties against countries refusing to receive British goods on terms of reciprocity we shall render it the palpable and unmistakable interest of foreign states to act upon the true principles of free trade" (Torrens' *Commercial and Colonial Policy*, 1844, *ad finem*, pp. 26, 27 of the "Letter" to Sir R. Peel).

The principle advocated by Torrens is much the same as that of late years current under the name of FAIR TRADE.

The term "reciprocity" survives in the commercial legislation and treaty arrangements of the United States of America. The "reciprocity treaty" has long been a favourite instrument with that republic. Under such a treaty one nation grants the other special reductions of import duties in return for equivalent reductions by the other country (see RECIPROCITY IN U.S.). It may be said, therefore, that the treaty policy of the United States has for some years been based upon a principle of reciprocal concessions.

This policy is nearly akin to the interpretation of the most favoured nation clause adopted by the United States government (see Parl. Paper C 4340, 1885). Under this interpretation, where any nation as a result of bargaining receives concessions in the ports of the United States, the States decline to give the benefit of the clause to any other nation which has not made specific concessions equivalent to those made by the nation to whom they grant their favours.

[Smith, *Wealth of Nations*, McCulloch ed. 1870, note xii. p. 538.—Torrens, *Budget of Commercial and Colonial Policy*, London, 1844, pp. 48-49, 61, 242.—Huskisson's *Speeches*. See also Sir Louis

Mallet, "Reciprocity" in *Cobden Club Papers*, p. 6. "The imposition of a duty by one country on the produce or manufactures of another only affects the transactions by rendering it less profitable both to the seller and to the buyer; the variations of supply and demand will cause the incidence of the tax to fall upon the seller and the buyer, the producer and the consumer, in varying degree; but, in the long run, it will be equally shared between them." Also bibliography, art. on RETALIATION.]

C. A. H.

#### RECIPROCITY IN THE UNITED STATES.

Commercial reciprocity as a distinct system has had an uncertain existence in the United States. Upon the establishment of the present form of government in 1789, American legislation was in harmony with that of the rest of the world as to protection to home commercial interests. Higher duties were placed on goods imported in foreign ships. Treaties of 1794 and 1815 tended to liberalise commercial arrangements and to remove certain special restrictions. Between 1845 and 1854 there was considerable discussion as to reciprocal free trade between Canada and the United States, and in the latter year a treaty of reciprocity was ratified by which the British-American sea fisheries were open to citizens of the United States and free import of certain raw and some manufactured commodities was given to Canada. This was terminated in 1866. The advantage of this to the interests of the United States has been much questioned, as for example by James G. Blaine in *Twenty Years of Congress*, vol. ii. p. 620. An attempt was made to renew this treaty in the treaty of Washington of 1871, but was unsuccessful (for detailed references to this question see E. Schuyler's *American Diplomacy*, New York, 1886, p. 430).

In 1844 a treaty was signed with the ZOLLVEREIN providing for certain reciprocity favours, but was rejected by the United States senate on the ground that this was an invasion of legislative rights by the executive. Reciprocity treaties with Mexico in 1860 and 1883 also failed of ratification by the senate. A reciprocity treaty with the Hawaiian Islands was ratified in 1875, by which provision was made for the admission of sugar free of duty in the United States in return for the remission of duties on certain articles manufactured and produced in the United States. A reciprocity movement with the Latin-American countries developed in 1882, but for this it was also impossible to secure congressional endorsement.

By act of 24th May 1888, the president of the United States was authorised to invite delegates to an international American conference to consider measures for the formation of an American customs union. This proposition was found to be impracticable, but nearly all of the American republics recommended the negotiation of reciprocity treaties. This idea was incorporated into the Tariff (McKinley) Act of 1890, § 3. Agreements were made with various countries, notably Brazil, San Domingo, Costa Rica, and other countries by

which, in consideration for the removal by the United States of duties imposed upon sugar, coffee, and other raw productions of the countries named, those governments removed or reduced the import duties formerly imposed upon bread stuff, provisions, lumber, coal, and other products. This reciprocity provision was dropped from the Tariff Act (Wilson) of 1894. Owing to the brief existence of these agreements, and also to the fact that a severe commercial and financial depression interrupted trade in 1893, it is difficult to furnish evidence as to their value. In 1897, the republican party in general advocated the reintroduction of such a policy, while the democratic party opposed. The Tariff Act (Dingley), 1897, consequently reintroduces certain reciprocity provisions [Commercial Arrangements concluded with Foreign Countries, 55th Congress, 1st Session, Senate Doc. No. 52, p. 150; also *Report of the Committee on Ways and Means concerning Reciprocity and Commercial Treaties*, Washington, 1896, p. 643; also the Reciprocity Treaty with Canada of 1854, by F. E. Haynes in *Pub. Amer. Ec. Assoc.*, v. 7 pp. 417-486, and for subject in general, E. Schuyler's *Amer. Diplomacy*, New York, 1886, ch. ix.]

D. R. D.

### RECOGNITION.

- (a) Recognition of New Form of Government, p. 269;  
(b) Independence, p. 269; (c) Belligerency, 269.

International law knows at least three kinds of recognition, and it may be doubted whether a fourth is not slowly shaping itself. With the vast development of trans-oceanic commerce this subject becomes one of considerable economic importance.

(a) There is first *Recognition of a new form of Government* in an old-established state. This occurs when, as the result of a successful revolution, or a peaceful change, a monarchy is turned into a republic, or a republic into a monarchy, or a kingdom into an empire, or a new line of kings is established in a country, or a new president takes the place of one who is overthrown. It is the custom for other states to recognise the new government and carry on with it the intercourse they were wont to carry on with its predecessor, when events have shown that its own subjects and citizens are content to submit to its authority and allow it to speak on their behalf. The only alternatives to recognition in such a case are a cessation of intercourse or a war of intervention. The first is impracticable, unless the state in question is very insignificant; the second is happily rare. Despotic rulers are not eager to recognise republican governments; nor are powerful republics quick to enter into relations with successful dictators. But if the new political institutions prove to be stable, recognition must be accorded sooner or later. Thus Prussia, which was at first unwilling to treat as an established government the group of men who proclaimed the French Republic on 4th September 1870, entered into negotiations for peace with them in January 1871, after five months of strenuous warfare had shown that France entrusted her resources and her honour to their keeping.

(b) The next kind of recognition to be considered is termed *Recognition of Independence*. It happens when a new state is received into the family of nations and allowed to take its place as an international unit among the other powers of the civilised world. The rise of such a state is usually due to successful insurrection; and it is this case which has attracted the attention of statesmen and publicists, and caused the development of well-established rules. If a province or a colony revolts with a view to obtaining a separate state-existence of its own, other powers may recognise its independence without giving just cause of offence to the mother country, when the struggle is actually or virtually ended in favour of the political community claiming to be a new state. A *de facto* independence which bids fair to be permanent, and against which no serious efforts are made by the state most concerned in destroying it, is a matter of which other states may take notice as their inclinations and interests prompt. But if they recognise independence while the recognised power is still engaged in an uncertain conflict, their act is an act of intervention which the mother country may justly resent by war. This was the case in 1778 when France recognised the independence of the revolted British colonies in North America, while Great Britain was putting forth all her power in order to reduce them to obedience, and the result of the struggle was a matter of the greatest uncertainty. We immediately went to war with France, as the French government had calculated that we should. On the other hand, our recognition of the independence of Buenos Ayres, in 1824, caused no war with Spain, because that power had for years practically abandoned the contest with its rebellious dependency, and left it to the enjoyment of actual self-government. Recognition of independence may be granted either by formal declaration or by entering into such relations as usually exist between independent states, as for instance the negotiation of a treaty, or the reception of a diplomatic representative. When a new state comes into being by some more peaceful process than separation from a state already in existence, there can be no question as to the propriety of its recognition as an independent member of international society, provided that it possesses a government capable of fulfilling the duties and supporting the responsibilities thrown upon civilised powers by modern international law (see Lawrence, *Principles of International Law*, §§ 57-60).

(c) *Recognition of Belligerency* forms the third of the kinds of recognition we are considering. When a community engages in insurrection against the constituted authorities with the object of changing the government, redressing grievances, or securing its own independence, it places itself in a peculiar and anomalous position. War is a function of states, and it is not a state—it may not even wish to become one. On the other hand, it is supporting armies, and possibly navies also, and is carrying on hostile operations with all the means at its disposal. If it is not a lawful belligerent its troops are bandits and their acts of force mere robbery and murder. Yet, as we have just seen, its independence and statehood cannot be

recognised, while the struggle still continues, without a breach of comity towards the parent state. Moreover, difficulties arise about such economic questions as the validity of attempts on the part of the insurgent governments to regulate foreign commerce at their ports by levying import duties, granting clearances, and exercising a general superintendence. These matters have been settled by what is called recognition of belligerency, which accords to the recognised community all the rights and obligations of a state as far as the war and foreign commerce are concerned, but no further. Its troops are lawful combatants, its ships of war lawful cruisers, its captures lawful captures, its customs lawful duties, and its blockades lawful blockades. But it may not send regular diplomatic ministers, or negotiate treaties, or carry on with neutral powers the usual official intercourse between government and government. Recognition of the belligerency of insurgents is never welcome to the state against which they are in revolt, though it gains by being free from international responsibility for the acts of its rebels, and by being able to enforce against recognising powers all the rights over neutral commerce possessed by a regular belligerent. But recognition gives it no just ground of quarrel if the recognised community possesses an organised government, ruling over a fairly well-defined territory, and carrying on war in civilised fashion with forces under a reasonable degree of order and discipline, and if, in addition, the interests of the recognising state are so closely affected by the conflict that it is obliged to decide how it will treat the insurgents and their operations. The question was thoroughly discussed in the controversy which grew out of the recognition of the belligerency of the southern confederacy by Great Britain in 1861, soon after the outbreak of the great civil war in the United States (see *Letters of Historicus*, London, 1863). The rules laid down above would be generally accepted to-day, but they do not cover every possible or probable case. Five times within recent years has a conflict against established authority been maintained mainly by a revolted fleet. On none of these occasions did other powers recognise belligerency, but whenever the revolt was serious and long-continued, they hesitated to treat the insurgent ships as pirates. Only in one case, that of Chile in 1891, was the insurrection successful. Yet in every case a distinction was made in practice between the revolted cruisers and ordinary pirates; and, with some few aberrations, the principle was acted upon that, as long as there was no attempt to exercise belligerent rights against the subjects and commerce of other powers, they on their part would not interfere with the operations of the insurgent squadrons, or prevent the exaction of reasonable customs duties in ports under insurgent control. Some name for this is required, and it might well be called recognition of insurgency (see an article by Lawrence called "Recognition of Belligerency considered in relation to Naval Warfare," in the *Journal of the Royal United Service Institution* for January 1897). Recognition by one power does not bind other powers, and the insurgents whose belligerency is

recognised do not acquire the rights of war as against neutrals, except in respect of those states who have accorded them recognition. The mother-country cannot be expected to recognise in a formal and official manner the belligerency of its revolted subjects; but in practice it generally treats them as lawful combatants, from both humanity and a desire to avoid reprisals.

**RECOGNITIONS.** The system of recognition by jury was improved and extended under Henry II., who, in what is known as the Great Assize, applied it to obviate the need of having recourse to trial by battle in disputes as to land. Glanvill (*De legibus Angliæ*, ii. c. 7-17) states that the proceedings began by the person in possession applying the *Curia Regis* to stay all other proceedings until the cause for which he placed himself on the assize had been determined. His adversary then applied to the court for a writ by which four knights of the same country and neighbourhood should be directed to choose twelve lawful knights, also from the same neighbourhood, who should declare an oath which of the two litigants had the greater right to the land in dispute. When the four knights had appeared before the court, and the twelve had been nominated and sworn, the recognition proceeded on the day appointed, whether the case was defended or undefended. If the twelve jurors knew the facts of the case and agreed on a verdict the cause was ended; but if some of them were ignorant of the facts they were to be set aside, and others called in their place who were better informed. So, also, if they were divided in opinion, others had to be brought in until twelve were unanimously in favour of one side or the other. The course in the assizes of Novel Disseisin, Mort d'ancestor, Darrein presentment, and others was the same, except that the sheriff nominated the jurors.

It will be observed that the jurors were sworn witnesses to the fact, and not, as at present, judges of the fact, founding their verdict wholly on testimony brought before them. It is also remarkable that their knowledge of the case might be derived *per verba patrum suorum*, or from persons in whom they implicitly trusted.

[Stubbs, *Const. Hist.*, i. p. 615.—*Select Charters*, p. 161.—Sir F. Palgrave, *The Merchant and the Friar*, 1837, 2nd ed. 1844. R. H.]

**RECOINAGES**, or the calling in of old and issue of new coins, played a very small part in English history down to 1547. Nearly every alteration of the coinage (1066 to 1543) reduced its weight but not its fineness, and

since 1344 (when gold began to be regularly coined) affected both metals simultaneously; the exceptions are the lightening of gold only in 1465, and the issue of one base gold coin in 1526; so that as a rule the new circulated on equal terms with the old abraded and depreciated coins. True, we read of detached laws demonetising light silver and offering to recoin it at the holder's expense (1292), and in one case the king offered to waive his dues if light gold were brought in for recoinage within a certain date (1421), thus putting a premium upon speed. And, doubtless, the debasement of gold and silver (1543-45) drove out the old coin, but by natural and not artificial means. The difficulty of superseding the old coinage was never crucial until the task of restoring gold and silver was undertaken, in 1549 and 1548 respectively; for the two metals have, since 1548, been dealt with separately. In order to restore gold (1549-53) the old coins were exchanged at the mint during a certain interval at tale rates; afterwards their tale values were reduced. Similarly in such subsequent alterations of the gold coinage as have been due to the altered ratio of gold to silver, and therefore involved reductions of weight, the tale value of old pieces has been usually raised. Other restorations of the coin being due to light and base coin, have involved complete demonetisation, which has been effected differently at different times. The most important instances were the following:

In 1560-61 the mint took base silver testoons and groats at a reduced tale rate from 27th September to 20th May, adding, up to 25th April, a premium for large quantities. Lesser silver moneys were similarly bought in up to 20th September. Otherwise part of the base money was demonetised 9th April, and the other part 20th July. The mint bought in £638,113:16:6 tale, and netted a profit of £14,079:13:9 (Froude, *Hist. of England*, vol. vii. p. 453, confuses silver with total recoinage).

In 1696 tax collectors took light and base silver coin at tale rates from 1st Jan. to 4th May, and tellers of the exchequer up to 24th June (7 & 8 Will. III. c. 1); then they paid it in to the central and to five local mints to be recoined. After this last date its demonetisation was complete. The remaining hammered silver money was taken by weight at the mints from 4th Nov. 1696 to 1st July 1697 at a premium of 2d., and by tax collectors for a less period at a premium of 4d. per oz. over mint value; otherwise it was demonetised 1st Dec. 1696. These two recoinages amounted, according to Ruding, to £6,882,908:19:7 tale, and cost £2,700,000 (?) (Ruding includes recoinages from plates; Macaulay, *Hist. of England*, ch. xxi., confuses these two processes.)

In 1773-74 tellers of the exchequer, tax

collectors, and special local exchangers, bought in at tale rates two classes of light gold coin during 1½ months and 3 months 19 days respectively, and exchanged them at the Bank of England, which forwarded them to the mint for recoinage; a third and worse class was bought in by weight. This recoinage cost £517,320:2:2½.

In 1817 tale values were given by the mint, helped by local exchangers and banks, for all light silver from 12th Feb. to 1st March, and for all but the lightest silver for another three months; otherwise the old silver was demonetised 1st March. In this recoinage most of the new coin was ready before the old coin was called in. This recoinage amounted to £2,599,487:5:2 tale, omitting coins coined in advance or out of plate, etc., and cost £793,624:13:5, £233,764:3:10 of which was paid out of profits of the new silver (token) coinage [*Accounts and Papers*, 1818, No. 227]. In the copper recoinage of 1817 copper more than twenty years old was brought in by weight with the usual premia for quantity and speed. The recoinages of gold, under the act of 1891, had withdrawn up to March 1905 about £49,800,000 in sovereigns and half sovereigns. For further details see LIGHT GOLD AND SILVER COIN.

[R. Ruding, *Annals of the Coinage*, 3rd ed. 1840.—United States *Annual Reports of the Director of the Mint* state annual recoinages of every important country.] J. D. R.

RECORDE, ROBERT (1510?-1558), was admitted at Oxford about 1525 and elected fellow of All Souls' in 1531. He taught mathematics and medicine at Cambridge, graduated M.D. there in 1545, returned to Oxford, and afterwards practised as a physician in London in 1547. He became controller of the mint at Bristol in 1549, and in May 1551 general surveyor of the mines and money in England and Ireland.

He was the first who wrote on arithmetic, geometry, and astronomy in English; he introduced algebra into England, and was probably the first among his countrymen to adopt the system of Copernicus. His works include some on medicine. The mathematical treatises are (1) *The Grounde of Artes* (1540, and many subsequent editions to 1699) on arithmetic, in which reference is made to a publication on alloys, contemplated by Recorde; (2) *The Whetstone of Witte* (1557, etc.) on algebra, the first English book containing the symbols + and -, and "a paire of paralleles, or Gewowe lines of one lengthe, thus:" = to represent equality; (3) *The Pathway to Knowledge* (1551, etc.) on geometry; (4) *The Castle of Knowledge* (1551, etc.) on astronomy.

[*Dictionary of National Biography*, vol. xlvii. p. 367-369.—Prof. de Morgan in *Companion to the Almanac*, 1837, p. 30.] H. R. T.

RECOURP (Fr. *recoupe*). To replace, or regain a sum advanced or lost. R. W. B.

**RECOURSE.** In dealing with bills of exchange, each holder has a right of recourse upon his immediate endorser and upon every other previous endorser, provided the bill has been duly presented at maturity, and noted or protested according to law, and also that the demand for repayment is made in due course without delay. As a matter of convenience it is usual, in extensive discount operations, in the case of bills endorsed in blank by previous holders, to dispense with actual endorsement of each bill by obtaining a written undertaking to admit recourse. In some cases bills are discounted without recourse, and are so endorsed. Coupons and notes, payable abroad, are sold with recourse unless otherwise agreed. R. W. B.

**RECOVERY.** A collusive action by means of which a tenant in tail could bar all entails, remainders, and reversions, and could either convey an estate in fee simple to a purchaser, or retain it himself. This was in ordinary use from the reign of Edward IV. to the year 1833. Roughly speaking, it was a device by which a man whose estate was entailed on his children could "cut off the entail," that is, deprive them of their right to succeed him, and could either keep his land as a fee simple, or sell it to strangers. It resulted from the desire of the judges to break down the statute of Edward I. known as *de donis*. In a common recovery with "double voucher," the lands were conveyed by deed by the tenant in tail to a person called the "tenant to the *præcipe*," against whom feigned proceedings were then taken in the court of common pleas. The "demandant," or intending purchaser, who desired to become the "recoveror," issued a writ against the tenant to the *præcipe* who thereupon called on the tenant in tail to warrant his title in accordance with a supposed agreement to do so. The tenant in tail, in his turn, vouched or called upon some landless person, usually the crier of the court, to warrant his own title. The demandant then, by permission of the court, took the crier or "common vouchee" aside to speak with him, and having once quitted the court, the man did not return. On this default judgment was given for the demandant or recoveror to recover the lands from the tenant to the *præcipe*, that is, in reality, from the tenant in tail; and for the tenant in tail to recover lands of equal value from the common vouchee, who, by disappearing, had failed to warrant his title. If lands of equal value had actually been recovered, they would have taken the place of those lost by the common vouchee's default, and would have descended to the issue of the tenant in tail; but as the man had no land, the judgment of the court against him was nugatory, and thus not only the rights of the issue, but also of the reversionsers and remainder men were defeated, and the estate tail was therefore said to be barred. On the other hand, the demandant

or recoveror obtained by judgment of the court an estate in fee simple of which the sheriff was directed by writ to put him in possession. This jugglery was abolished by statute 3 & 4 Will. IV. c. 74 (see *ENTAIL, LAW OF; FINE*).

[Joshua Williams, *Law of Real Property*.—Hallam, *Constit. Hist.*, cap. i.] R. H.

**RECTA PRISA** was the right which, according to *Fleta* (Lib. 2, c. 22, written circa A.D. 1290), the king exercised in taking one barrel of wine from the prow and another from the stern of every vessel laden with wine, on payment of twenty shillings for each such barrel. If he required more he was obliged to pay a price settled by trustworthy people (*precium fide dignorum*).

Whether this definition was correct or not in 1290, it does not altogether agree with that given in *Liber Albus*, written a hundred and thirty years later. In that work the king is stated to have been entitled to take 2 tons of wine from every vessel bringing 20 tons or more; and 1 ton from every vessel bringing 10 tons or more but less than 20 tons. From a ship bringing less than 10 tons he was entitled to take nothing.

The Cinque Ports and the port of London claimed to be exempt from *Recta Prisa*, but it is clear from the terms of the grant to the barons of the Cinque Ports in 6 Ed. I. that the exemption was only intended to apply to wines imported by them for their own use.

REDEMPTION, EQUITY OF. See EQUITY OF REDEMPTION.

RE-ENTRY. The right of re-entry is the name given to a lessee's right to cancel the lease and take possession of the property leased in the event of the lessee failing to observe the covenants contained in the lease. This right has been rendered much less oppressive by recent legislation (see ENTRY, RIGHT OF). E. S.

REES, OTTO VAN (died 1868), born at Liège, Belgium, studied law at Utrecht from 1844 to 1851, and practised in it there till 1858. He then was appointed professor of Political Science at the university of Groningen, and in 1860 at that of Utrecht, where he lived until his death in 1868. Besides a large number of articles on different historical and economic subjects, for the greater part published in his periodical the *Pantheon*, Van Rees wrote the following more distinctly scientific works:

*Verhandeling over de Aanwysing der politieke gronden en maximen van Holland en West-Vriesland door Pieter de la Court.* (Treatise and Summary of Political Bases and Maxims in Holland and West-Vriesland, by P. de la Court), Utrecht, Dekema, 1851.—*Prysverhandeling over de verdiensten van Gysbert Karel van Hogendorp als staathuishoudkundige, ten aanzien van Nederland.* (Prize-Essay on the Merits of G. K. van Hogendorp as an Economist, with reference to the Netherlands), Utrecht, Van der Post, 1854.—*Voorlezingen over de geschiedenis der Nederlandsche volksplantingen in Noord-Amerika, beschouwd uit het oogpunt der koloniale politiek* (Lectures on the History of the Dutch Colonies in North-America, considered from the point of view of Colonial Politics), Tiel, Campagne, 1855.—*Geschiedenis der staathuishoudkunde in Nederland* (History of Political Economy in Holland), Utrecht, Kemink en Zoon, 1865 and 1868.

Of these works, which all have an historical character, the latest mentioned especially has great merits; the first part of this contains a very complete history, not only of the science of political economy in Holland, but also of the general social development of Holland to the end of the 18th century, from an economical point of view; the second part gives the history of the East- and West-Indian Companies; it is the best work written on that subject.

A. F. V. L.

REEVE. The *propositus* or representative usually elected by the villeins of a manor from

among themselves, though sometimes nominated by the lord. He had the public duty of going with the priest and four other men, *hundredarii*, to attend the hundred court, the court of the county, and the justices in eyre, when the lord of the manor himself did not go. He also led the men to the FYRD (*q.v.*). At other times he acted as a kind of foreman of the villeins, superintending their labour and keeping account with the bailiff of the due performance of each man's yearly task. In return he was freed from all the ordinary duties of a villein in respect of his holding; but the office does not seem to have been desired, and Maitland (*Sel. Pleas in Manorial Courts*, pp. 23, 45) gives instances of considerable payments made for permission to relinquish it. At Whissonsett in 1382 (*Court Rolls*, in possession of Mr. Walter Rye) the office was annexed to certain holdings in turn. R. H.

REFEREE is the name for a person to whom a dispute is referred as arbitrator (see ARBITRATION).

All proceedings under a reference are now regulated by the Arbitration Act 1889, which deals with arbitrations agreed on by the parties, as well as with references under orders of court. In either case the referee has extensive powers as regards the summoning and the examination of witnesses, and his award is enforced in the same way as a judgment of the court. Three "official referees" are attached to the supreme court, but arbitrations ordered by the court may also be referred to "special" referees, whilst, on the other hand, voluntary arbitrations may be taken before the "official referees" (see *Arbitration Act*, 1889, § 3). E. S.

REFERENDUM means the decision of a political question, partly by the direct votes of the people, partly by representative institutions. Decisions by a people without representative institutions, as in Tacitus (*Germania*, xi.), or in the "Landesgemeinde" of Glarus, Uri, Unterwald, and Appenzell for the last six centuries, or in the "town meeting" of New England townships for nearly three centuries, or in Rousseau's or More's Utopias, illustrate "direct self-government," not the referendum. Again in 1888 *et seq.*, French and Italian mayors took the votes of their constituents on matters involving expense; this, like the votes in Belgian towns for universal suffrage (Feb. 1893), and the Durham miners' vote against eight hours (1891), and the South Australian vote on education (1896) binds nobody, and therefore does not belong to politics. Votes for a person are "plébiscites" not referenda; and the Belgian election in 1892, in order to revise specified articles of the constitution, was an election *ad hoc*, not a referendum. Again the Swiss laws of 1874 and 1892, under which one of the two federal councils or 50,000 citizens may demand a popular vote whether the constitution or some part of it shall be

amended, is "popular initiative" or "mandate"; and "mandate," though it may (since 1892) take the form of a "projet de loi," is not, strictly speaking, referendum. Again the arrangement under which the Swiss constitution of 1802 was rejected by a majority of actual but not of registered voters, and was declared accepted, is more properly classed as "veto"; but "mandate" and "veto" are sometimes classed as "referenda."

*Origin.*—In the 15th century certain communes in the Grisons of the "Landesgemeinde" type appointed delegates to form leagues; these delegates accepted the decisions of the league "ad referendum," i.e. subject to the approval of their respective communes. Similarly in 1643 four colonies formed New England, but the Plymouth delegates would not sign the federal articles until they were approved by their constituents. It arose in the federal efforts of directly self-governing townships.

*Progress.*—In the United States two of the eleven original states which framed constitutions after the secession submitted them to popular vote. In both the township system prevailed. Only one of the thirty-two state constitutions between 1868 and 1893 was not submitted to popular vote. And constitutional law has enlarged its scope so as to include state loans, etc. Again "local option" laws were almost unknown in 1850; since then each state has passed numerous laws to enforce free schools, teetotalism, land registration, etc., which are null and void, except where voters of some locality ratify them. Of Swiss federal constitutions since 1802 two were not (1803-1815), two were (1848 and 1874) submitted to the referendum. That of 1874, like that of 1848, contains a compulsory referendum in case of amendments to the constitution (art. 121) (compare the French system of 1795, art. 343, 346). It also has a permissive referendum in the case of all other laws and non-urgent general resolutions (arrêtés); these being null and void for 90 days, during which 30,000 voters or 8 cantons may demand a referendum (compare the French system of 1793). According to Lowell, between 1874 and 1897  $\frac{1}{2}$  laws, etc., were submitted to permissive, 14 to compulsory, referendum. The people have thus accepted civil marriage plus divorce, bankruptcy, and factory acts, a federal monopoly of bank notes (1891) and spirits, compulsory purchase of railways by the federation (1897), compulsory insurance, a fighting tariff, and capital punishment, and have rejected compulsory vaccination, federal bank notes (1875) and secular education. They also used, in 1893, the "mandate" to obtain an anti-Jewish Slaughter of Animals Act, which their legislature wisely worded so as to make it inoperative; in 1894 a mandate for "le droit au travail" was rejected. As for cantons, the con-

federation only guarantees their constitutions, if ratified and alterable by a majority of citizens (art. 6). The referendum, confined to a few cantons in 1830, now figures in the legislation of every canton except those of the Landesgemeinde type and Fribourg; and the compulsory Zurich system of 1868, under which all laws and most general resolutions are null and void until accepted by the people in their meetings twice a year, had in 1895 spread to 9 other cantons. In Belgium a royal referendum has been proposed and rejected (1892-93).

In England adoptive acts have worked by means of a local referendum (1819-94). Guardians could, with the consent of the vestry, buy and let allotments since 1819. Other laws enabled (say) fifty ratepayers to require a poll—this is "the mandate," and a 3rd, latterly a bare majority of voting ratepayers to adopt for their parish elected vestries (1831-94), lighting and watching (1833), burial places (1852), recreation grounds (1860), baths (1846), and libraries; but in boroughs the town council stood in place of the ratepayers except as to libraries, an exception which disappeared in England and Scotland, 1893-94. The constituents might since 1870 similarly create or, since 1876, destroy a school board subject to governmental discretion; a power which, since 1894, has been transferred to parish meetings or polls in rural districts. Advocates of temperance and a universal eight hours' day often rely on local option. Small groups of ultra-socialists (L. Gromlund, *Co-operative Commonwealth*, 1892, p. 129) and ultra-individualists (Auberon Herbert, *Anti-Force Papers*, 1885) advocate the Zurich system. A strike is usually preluded and concluded by a vote of strikers, though there are strike delegates.

In 1893 the House of Lords proposed to allow certain workmen by a  $\frac{2}{3}$  majority to exclude the Employers' Liability Bill from their industry (Hansard, 4S. vol. xx. pp. 2 and 3); this proposal has not been revived in the discussions of the act of 1897; had it been passed it would have been the only instance of the popular veto in English legislation.

"Mandate" and "referendum" are also loosely used in political discussions, thus the proposal, made perhaps for the first time by Lord Salisbury twenty-five years ago (see Courtney's speech, *Times*, 9th Oct. 1884), often made by Conservatives and always rejected by Liberals, that an election should settle differences between the Lords and Commons, is commonly referred to as the "referendum de partage," instead of "the election *ad hoc*." The referendum can hardly be introduced into constitutional questions, except where the representative is regarded as a delegate, and that is not the case in England.

[J. Berney, *L'Initiative populaire et la législation fédérale*, 1896.—S. Deploige, *Le Referendum en Suisse* (1892), translated C. P. Trevelyan, with introduction and bibliography by L. Tomm.—Nunna Droz, *Contemporary Review*, vol. lxvii. p. 323.—A. L. Lowell, *Government and Parties in Continental Europe* (1897).—E. P. Oberholzer, *The Referendum in America* (1893).—R. de la

Sizeranne, *Le Referendum communal* (1893).—J. Signorel, *Étude de Législation Comparée sur le Referendum Législatif* (1896).—L. Tomn, "The Referendum in Australia and New Zealand," in *Contemporary Review* (August 1897), mentions attempts to introduce a "referendum de partage."—S. and B. Webb, *Industrial Democracy*, 1898.]

REFINING. See ASSAY.

REFORMATORIES. See PRISON LABOUR.

RÉGALE. During the vacancy of an archbishopric or bishopric the French kings claimed the right (1) to receive all the revenues of the diocese, (2) to appoint to all benefices vacant during the interval, (3) to send royal officers to administer the temporalities of the see. These three rights, collectively called the *régale*, were first formulated in the testament drawn up by Louis IX. before his departure on the crusade. In the reign of Louis XIV. it was determined to extend the system of the *régale* to the provinces recently added to France. This gave rise to a vigorous struggle on the part of the bishops in the annexed provinces, and their cause was supported by the pope. To coerce the papacy, Louis obtained from the national synod of the clergy the four articles of 1682, which declared the practical independence of the Gallican Church. The Pope Alexander VIII. found it necessary to give way on the original ground of quarrel, and the *régale* was enforced in all the provinces of France as long as the monarchy lasted.

[Gasquet, *Précis des Institutions Politiques et Sociales de l'Ancienne France*, tome ii. ch. i.]

R. L.

REGALIA. The term *regalia* was used by the civilians to denote the royal rights of a sovereign. *Majora regalia* comprises the greater rights relating to the royal character or authority, *minora regalia* the lesser rights including rights to revenue. [Stephen's *Blackstone*, bk. iv. p. 1.]

The term is also used to denote the ensigns of royalty such as the crown, the sceptre, and coronation robes.

J. E. C. M.

REGARDERS. See FORESTS, MEDIEVAL.

RÉGIE. A French word which, in its widest sense, means the administration of goods by a responsible agent. In a more special sense, it is applied to levying taxes, in contrast to farming them (see FARMER GENERAL; FARMING OF TAXES; PUBLICAN), and to the construction of public works, by the state itself, instead of building by contract. It is also often used as the name of monopolies belonging to the state in France, particularly the monopoly of tobacco.

[Article "Régie" in the *Nouveau Dictionnaire d'Economie Politique*.]

REGISTRATION, SCOTTISH LAND SYSTEM. See LAND REGISTRATION; SASINE.

REGRATOR. See FORESTALLERS AND REGRATORS.

REGULATED COMPANIES were mercantile associations holding the exclusive right of trade with certain countries. Each member managed his own business on his own capital, but was obliged to observe the company's regulations.

The Hansards of the Empire (see HANSEATIC LEAGUE) and the merchants of the STAPLE were two of the earliest regulated companies. However they had decayed before the end of the 16th century. Of more importance to England's budding commerce were the Merchant Adventurers (see ADVENTURERS, MERCHANTS) the TURKEY, LEVANT, RUSSIA, and EASTLAND companies. The Adventurers sprang from the Mercers' Guild in 1407, and still existed at the end of last century; they traded between the River Somme and the Skaw in cloth. The Turkey Company, descended from the Grocer's Guild, was confined to merchants who were freemen of London. The fine on entrance was reduced to £20 by parliament in 1752 (26 Geo. II. c. 18), but Adam Smith declares it in his time "a strict and oppressive monopoly." The Levant Company was incorporated in 1581, continued by the Long Parliament in 1644, and suppressed in 1825 (6 Geo. IV. c. 33). The Russia or Muscovy Company's charter dates from Philip and Mary; it was one of the most exclusive associations, but its fees were cut down to £5:10s. by parliament (10 & 11 Will. III. c. 6). The Eastland Company, trading with the Baltic, was incorporated by Elizabeth; originally oppressive, its fees were reduced to 40s. in 1684 (25 Car. II. c. 7). Besides these, the EAST INDIA COMPANY from 1600 to 1612 was a regulated company, and in 1698 the "General" East India Company was formed on the same basis. The old "London" East India Company joined as one of its members, but ten years later the two combined on a joint-stock as the "United Company of Merchants of England trading to the East Indies." The China tea-trade was, however, managed till 1834 by the "Co-hong" under the system of regulation. The African Company (see AFRICAN COMPANIES, EARLY) at first on a joint-stock, became in 1750 a regulated association; it failed through want of funds and the difficulty of management, and was dissolved (1 & 2 Geo. IV. c. 28).

These companies were formed to meet the necessity of combination amongst merchants in foreign parts before the 16th century. They therefore supported consuls to look after their interests, and the Turkey Company contributed towards the expense of the ambassador at Constantinople. Once a company was formed, the regulated system was only a natural extension of the ideal of "well-ordered trade," from municipal to international commerce. No one but a member of the company might trade within its territory. No member might

sell below the standard price. No member might sell more than a certain quantity in each year. It was these regulations which made the companies so unpopular. The sudden flood of wealth from the New World caused the 17th century to be a time of great enterprise. Apprentices and men of straw rushed into trade on borrowed capital and cut prices down to an alarming extent before they failed. Against these INTERLOPERS the companies sought to guard by high entrance fees, and no doubt the £25 fine of the Levant Company and the £50 and £100 fine of the Adventurers did keep many men out; at any rate it must have prevented a general merchant speculating on an occasional voyage, when he saw a favourable opportunity. However, in the case of the Adventurers, their revival in 1616, after an eight years' suppression, the report of the commission on trade in 1622, and their successful resistance to the complaints of the Merchant Adventurers of Exeter in 1643, 1645, and 1661, show that their contemporaries approved of them. With most of the other companies, parliament had to interfere after the Restoration, but revoked the charter of none.

More doubtful was the effect of the regulation limiting a merchant's annual sales. This STINT may be compared with the VEND (*q.v.*) of the Newcastle coal-owners, by which the probable amount of the year's demand was fixed by a committee, and each owner raised his share, proportionately to the output of his mine, as estimated relatively to the others (*cp. Report of the Select Committee on the Coal Trade, 1830, viii. 6*). Its supporters urged that by this device no one man could engross all the trade and form a virtual monopoly. Its opponents declared that it limited the supply of goods and raised prices. To this the Adventurers answered that as only one-tenth of the merchants authorised to trade used their privileges, the deficient supply was due to the unprofitableness of the trade, not to the company's action.

Throughout the 16th century, the regulated companies held their ground; in the 17th they were out of date. Men cared less for "well-ordered trade," and preferred to regulate commerce by customs and bounties rather than by the hated monopoly system. Sir Josiah CHILD (*Discourse of Trade, iii.*) and Adam SMITH (*bk. v. i.*) declare the companies are useless, and this the latter thinks "the highest eulogy." Probably their accusations of oppression and restriction were very much truer after 1650 than before. From the Revolution the companies steadily declined, and by 1800 were of no importance. L. R. H.

REGULATION OF LABOUR. See INDUSTRY, ORGANISATION OF.

REHABILITATION (Fr.). An act of procedure to restore to the person rehabilitated the possession of the civil or political rights, the loss of which has been incurred by bank-

ruptcy or condemnation for a grave criminal act. The most frequent demands for rehabilitation are those by a trader, who, since his bankruptcy and discharge, has paid all his former debts with interest and costs, including those from which he may have been released by composition or payment of a dividend. The petition must be addressed to a court of appeal, and if the result of the inquiry instituted is to show that the bankruptcy was not aggravated by any fraudulent acts, the rehabilitation is granted by a decree read in the court by which the demand was received, and is entered on the register. Among the disabilities of bankrupts removed by rehabilitation are incapacity to hold the offices of *agent de change* (see CHANGE, AGENTS DE) or broker, to enter a public bourse, to become an elector, or a member of a legislative body, or council of prud' hommes; to act as a juror, arbitrator, or witness to a notarial act, to obtain discount at the bank of France, etc. In England rehabilitation in the above-mentioned sense is obtained by an annulment of the Bankruptcy or by an order of discharge coupled with a certificate showing that the bankruptcy was not caused by misconduct (Bankruptcy Act, 1883, §§ 3 and 6). T. L.

REI. The rei, or ree, is the unit of account in both Portugal and Brazil. 1000 reis = 1 milreis (see MILREIS). F. E. A.

REICHSMARK. See MARK (GERMAN).

RELATIVITY, PRINCIPLE OF, IN POLITICAL ECONOMY. The principle that the economic doctrines true for any given epoch are relative to the particular circumstances of that epoch, and cannot be regarded as permanent or true for all times, is an essential element in the teaching of the historical school of economists. The idea of the relativity of economic doctrines follows easily from the conception of economic life as exhibiting continuous organic growth and development, and this conception is itself the natural outcome of historical study.

Richard JONES and Friedrich LIST are to be regarded as important forerunners of the historical movement rather than as themselves typical representatives of the movement itself. What is most characteristic, however, in their teaching is the insistence upon relativity in two particular spheres; and a brief reference to their views will serve to illustrate what is meant by the principle of relativity in general. Jones specially insisted on the limited applicability of the Ricardian theory of rent as regards both place and time. A theory based on the assumptions of individual ownership and freedom of competition could not, he pointed out, apply to oriental states of society in which joint ownership is the rule and rents are regulated by custom, nor even to those

instances nearer home in which land is held on a customary tenure, as in the *métayer* system (see *MÉTAYAGE*). Similarly, as regards limitation in time, he showed that the Ricardian law could not hold good in a condition of affairs such as existed in mediæval economy, when land was to a great extent held in common, and the relations between the owners and the tillers of the soil were not controlled by free competition. Turning to List, we find that his defence of protective duties is based on the recognition of relativity in the conditions of economic productivity in a community. The foundation of the argument is the position that all civilised communities of the temperate zone pass through successive economic stages, of which the last three are the stage of agriculture pure and simple, the stage of agriculture combined with manufactures in a nascent and slowly developing condition, and then the stage in which agriculture, manufactures, and commerce have all reached a high and well-balanced development. In the purely agricultural stage free trade with richer and more developed countries is, in List's view, a necessary condition of advance, and in the last stage of all free trade is also advantageous. On the other hand, the training and development required for passing from the second stage to the third can be acquired only by means of a carefully arranged protective system; and in the second stage such a system is, therefore, necessary for progress. The solution of the problem of protection *versus* free trade is thus regarded as relative to each particular people, and the stage of development which they have reached.

The principle of relativity in the sphere of economics was expressed in a more general form by Wilhelm Roscher. Applying to economic phenomena ideas which writers on jurisprudence had already applied to legal institutions and conceptions, he insisted on the necessity of always taking into consideration the varying character of economic habits and conditions; and, in particular, he pointed out the fallacy of criticising economic institutions, regardless of a people's history, and the stage of social and industrial development to which they had attained. Karl Knies affirmed still more definitely the relativity of economic doctrines in opposition to what he termed the *absolutism of theory*, that is, the claim—explicitly put forward by some of the older writers, and tacitly assumed by others—to offer something that is true unconditionally and in the same way for all times, lands, and nationalities. "In opposition to the absolutism of theory, the historical conception of political economy rests," says Knies, "upon the fundamental principle that the theory of political economy, in whatever form we find it, is, like economic life itself, a product of histori-

cal development; that it grows and develops, in living connection with the whole social organism, out of conditions of time, space, and nationality; that it has the source of its arguments in historical life, and ought to give to its results the character of historical solutions; that the laws of political economy should not be set forth otherwise than as historical explanations and progressive manifestations of the truth; that they represent at each stage the generalisations of truths known up to a certain point of development, and neither in substance nor in form can be declared unconditionally complete; and that the absolutism of theory—even when it gains recognition at a certain period of historical development—itself exists only as the offspring of the time, and marks but a stage in the historical development of political economy" (*Die politische Oekonomie vom geschichtlichen Standpunkte*, pp. 24, 25). This extract may be regarded as expressing the general view as to the relativity of economic doctrines taken by the historical school distinctively so-called.

The relativity of current political economy is affirmed no less definitely, but from quite a different point of view, by Walter Bagehot, who regards it of importance expressly to limit the science to one particular kind of society, namely, "a society of grown-up competitive commerce," such as we find in the most highly civilized modern communities. Political economy is, in other words, limited to "the theory of commerce, as commerce tends more and more to be when capital increases and competition grows." It will be observed that whilst the object of the historical school is to concentrate attention on economic history and on the study of economic development as opposed to the study of economic relations in a given society, Bagehot's object is just the reverse. He wishes to concentrate attention on current economic phenomena, and to avoid the distraction that must result from turning aside to the superficially corresponding but yet essentially different phenomena of earlier epochs.

In endeavouring to form an estimate of the importance to be attached to the relativity of economic doctrines we shall do well to have regard (1) to the distinction between economic theorems and economic precepts, and (2) as regards economic theorems, to the distinction between abstract and concrete economics.

Roscher in his affirmation of relativity is thinking mainly of economic institutions and economic policy, and in this sphere the principle of relativity may be laid down with less qualification than when we are dealing with economic laws in the more strictly scientific sense, that is, with statements of uniformities as distinguished from recommendations as to what ought or ought not to be done in practice. It is only

by the aid of abstraction that any claim to universality can be made good, and in formulating an economic policy, we cannot profitably carry abstraction very far. In theoretical investigations hypothesis and abstraction are often indispensable; but when we apply our theory with the object of laying down rules of practice, it is desirable to have recourse to hypothesis but sparingly. It is indeed doubtful how far, in the examination and criticism of economic institutions and policies, we can advantageously carry our abstraction even to the stage of neglecting social considerations of a purely non-economic character. Both the social and the economic bearings of a given line of action will, however, vary with the circumstances of different nations and different ages. Hence a given economic policy can in general be recommended only for nations having particular social and economic surroundings, and having reached a certain stage of economic development. It may be possible to formulate as having universal validity certain negative precepts, namely, that certain lines of action cannot under any circumstances be advisable; but on the whole the principle of relativity may be broadly accepted so far as economic precepts are concerned.

Passing from economic precepts to the body of positive doctrine which constitutes more distinctively the science of political economy, attention must be paid to the fact that economic doctrines vary in the degree of abstraction which they involve. Without professing to be able to draw any hard and fast line, we may adopt the suggestion made by W. S. JEVONS, and distinguish broadly between two stages of economic doctrine, which may be called the abstract and the concrete stage respectively (see article ABSTRACT POLITICAL ECONOMY). Concrete economics is not content with merely hypothetical results, but avowedly takes into account special conditions of time, place, and circumstance; and it follows immediately that the conclusions already arrived at with regard to the relativity of economic precepts apply equally to concrete economic theorems. For the more fully we have regard to special conditions of time, place, and circumstance, the more limited must be the applicability of our results. Many of the circumstances which exert an important influence on economic phenomena vary widely with the legal form of society and with national character and institutions; and even when the same forces are in operation there may be variation to an almost indefinite extent in the relative influence which they exert. The contrasts presented by mediæval and modern societies, and by contemporary oriental and European societies, considered in their economic aspects, are such as cannot possibly be overlooked. Many of the chief economic phenomena, such as RENT,

PROFIT, EXCHANGE, have their counterparts on each side of the comparison, but are singularly unlike in many of their characteristics; and over and above this, as societies progress, new economic phenomena, practically novel in character, spring into existence. Consider, for example, modern problems of CREDIT and of INTERNATIONAL TRADE; or again, the relations between the modern factory operative and the modern capitalist employer. Less striking contrasts, but contrasts that ought not to be neglected, are observable when we consider different modern communities of the European type in respect of particular economic phenomena, such as the tenure of land, the mobility of labour, and so forth. In every case the extent of the divergence can be ascertained only by direct observation and comparison; and it may be remarked in passing that, as regards mediæval and modern societies, whilst there was formerly danger of the differences being insufficiently emphasised, there is perhaps at the present time more danger of their being exaggerated. The notion, for example, that during the middle ages the forces of competition were entirely inoperative, is far from being borne out by the facts.

The relativity of concrete economic doctrines having been admitted, a claim for universality may still be put forward so far as the more abstract principles of the science are concerned. These principles do not profess to set forth the full empirical reality. They are admittedly based on hypothesis and abstraction. They require therefore to be constantly qualified and limited, sometimes in one direction, sometimes in another, before they can serve for the interpretation and explanation of actual economic phenomena. At the same time, some at least of them are universal in the sense that they pervade all economic reasoning. The law of the variation of utility with quantity of commodity, and the principle that every man so far as he is free to choose will choose the greater apparent good, may be given as examples of fundamental economic principles, which, in the words of Jevons, "are so widely true and applicable that they may be considered universally true as regards human nature." There are many other principles, which, with due modifications, are applicable to economic phenomena under widely different conditions. Take, for instance, the LAW OF SUBSTITUTION (*q.v.*) in the form that where different methods of production are available for obtaining a given result, the one that can do the work the most cheaply will in time supersede the others, or the doctrine that facilities of transport tend to level values in different places, while facilities of preservation tend to level values at different times. Compare, again, the Ricardian law of rent as ordinarily stated, with the principle of economic rent in its most abstract and general-

ised form. The Ricardian law, so far as it claims to determine the actual payments made by the cultivators of the soil, is a relative doctrine, that is to say, it is based on assumptions, which, as regards both time and place, hold good over a limited range only. The theory of economic rent in its most generalised form, however, merely affirms that where different portions of the total amount of any commodity of uniform quality supplied to the same market are produced at different costs, those portions which are raised at the smaller costs will yield a differential profit; and there is now no similar limitation to its applicability. This principle may even be said to hold good in a socialistic community, for the differential profit does not cease to exist either by being ignored or by being municipalised or nationalised. To take a further illustration, there is a good deal of abstract reasoning in regard to the laws of SUPPLY AND DEMAND that has a very wide application indeed. These laws work themselves out differently under different conditions, and in particular there are differences in the rapidity with which they operate. Their operation may, however, be detected beneath the surface even in states of society where custom exerts the most rigid sway. In all these cases and others similar the principles involved and the modes of investigation employed have a significance and importance which it would be misleading to call merely relative; and hence as regards the more abstract portions of economic doctrine the principle of relativity cannot be accepted.

The relativity of concrete economic truths, together with the universality of fundamental economic principles, might be illustrated by reference to the writings of the classical English economists. The historical school have rightly taught us that the works of these economists can be fully understood and appreciated only if they are studied in close connection with the economic history of the times when they wrote. Frequently the assumptions on which their reasonings are based have a special relation to the actual circumstances of their time; or, even if this is not the case, the form in which their doctrines are cast, or the emphasis laid upon particular points, will often be found to be specially related to the economic conditions in the midst of which they wrote. It is, however, going much too far to regard their whole teaching as limited throughout by the character of relativity which belongs to some of it. Much of what they wrote will be valuable for all time, not merely because of the light which their doctrines throw on the phenomena of particular periods, but because the principles underlying their best work are not confined in their applicability to any narrow or limited sphere.

In connection with the general subject of

relativity in political economy, a word or two may be added with regard to the relativity of economic definitions. Partly on account of the familiarity of much of its subject-matter, and partly for reasons connected with the growth of the science, political economy is for the most part limited in its nomenclature to terms already in common use. In different departments of economic enquiry, however, lines of distinction may need to be drawn at rather different points, and hence it is sometimes difficult to avoid the multiplication of technical terms, unless we are content to use the same terms in slightly varying senses in different connections. Thus, from the point of view of PRODUCTION it may be convenient to give a definition of WEALTH, not in all respects identical with the definition that is appropriate from the standpoint of DISTRIBUTION. Again, with special reference to its measurement, there may be advantages in defining wealth differently from the cosmopolitan, national, and individual points of view respectively. This procedure, that is to say, the frank adoption of the principle of relativity in framing economic definitions, has considerable weight of authority in its favour; but it is clear that, in so far as it is adopted, special precautions are necessary to avoid confusion. Further, economic definitions may be relative, not only to different points of view or different departments of study, but also to different stages of industrial development. Thus, in relation to the complex conditions of modern trade and industry, such terms as MARKET and MONEY may need different definitions from those that are appropriate in relation to more primitive conditions. Whilst, however, many economic definitions may be allowed to possess a relative or progressive character, this relativity cannot be extended to the ultimate analysis of the fundamental conceptions of the science. If these conceptions assume a somewhat different character in different connections, we shall still find something generic or universal in each one of them. Hence in the case of economic definitions as well as in that of economic doctrines, the admission of the principle of relativity must not be absolute or unqualified.

[For further discussion in connection with this article, see ABSTRACT POLITICAL ECONOMY; HISTORICAL METHOD; HISTORICAL SCHOOL OF ECONOMISTS. N. K.

RELEASE is a general name for the waiver or renouncement of rights. An interest in

land is conveyed by release, if the effect of such conveyance is the enlargement of the estate previously held by the person to whom such interest is conveyed. Thus, if a leasehold interest in land is to be enlarged into a freehold interest, the lessor *releases* his interest in such land to the lessee.

During the first half of this century the usual form of conveyance of land was by "lease and release"; the person wishing to convey the land in the first instance granted a lease, and at the same time executed a deed dated a day subsequent to the lease by which he released his interest. This somewhat cumbrous method, which was introduced during the 17th century for the purpose of evading the provisions of the Statute of Enrolments, was simplified in 1841, and rendered unnecessary by the Real Property Act of 1845. Releases operating as conveyances are therefore much less frequent now than they were at the beginning of the present reign.

The most common use of the word "release" in modern times occurs in the case of trust funds being divided among the beneficiaries, who thus "release and discharge" the trustees from the trust property, "and all actions, proceedings, claims, and demands in relation thereto." A release of this nature is, however, ineffective, unless all the facts are fully set out in the recitals, and it is also advisable that the parties executing the release should be separately advised, so as to avoid the possibility of the release being set aside on the ground of the beneficiaries not having been in a position to form an independent judgment. E. S.

**RELEGATIO.** The Roman punishment of banishment to a particular place; not, like *deportatio*, entailing loss of civil rights.

E. A. W.

**RELIEF.** The relief, with the other incidents of feudal tenure, was introduced into England by William the Conqueror. Its origin is to be traced in continental usage, and its growth coincides with that of hereditary succession. Early grants of land seem to have been made for the lifetime of the recipient, but it soon became usual to renew the grant to the heir of a deceased occupant, especially if the heir were willing to pay a sum to his lord for such renewal. As the right of succession to land hardened into law, so did this customary payment on the part of the heir, which is known as *relevamentum* or *relevium*. Thus the relief differs from the Anglo-Saxon *HERIOT*, in that the former implies, and the latter does not imply, a suspension of ownership. But the two payments were so similar in respect of occasion and incidence that the Norman lawyers found it difficult to avoid confusion between them. All lands granted by the Conqueror to his Norman followers, or re-granted to English holders, were henceforth bound to pay a relief on a change of occupants, and the same condition was naturally enforced by the mesne lords in their grants to sub-tenants. The amount payable was at first very uncertain,

and William Rufus and Ranulf Flambard found reliefs a convenient method of exaction. Church lands were free from the obligation of reliefs, as from those of wardship and marriage; but Flambard, in his endeavour to extend to the church the usages of lay fiefs, hit upon the plan of demanding a relief directly from the sub-tenants of a bishop on the occasion of a vacancy in the see. At the same time exorbitant reliefs were exacted from the heirs of royal tenants, the penalty for non-payment being forfeiture of the inherited estates. These exactions caused great discontent, and Henry I. sought to conciliate support by a clause in his charter, which runs: "If any of my barons, earls, or other tenants shall die, his heir shall not buy back his land as he used to do in my brother's time, but shall relieve it by a just and lawful relief; and in like manner the men of my barons shall relieve their lands by a just and lawful relief." From this time there was a constant struggle to obtain an exact definition of the "just and lawful relief," and gradually the royal claims were subjected, first to customary, and then to written, limitations. Glanvill, writing in the time of Henry II., states that the "reasonable" relief for a knight's fee is 100s., and for land held in *SOCAGE* one year's rent from the land; but the chief barons must satisfy the king according to the royal will and mercy. The author of the *DIALOGUS DE SCACCARIO* also tells us that the relief for the knight's fee is 100s., but that the heir to a barony must make his own bargain with the king. In *Magna Carta* the barons finally got rid of this remaining uncertainty. Art. 2 declares that the *Antiquum relevium* is £100 on an earl's barony or a baron's barony; 100s. on the knight's fee; and in other cases according to ancient custom. By the time of Edward I. the relief on a baron's barony had been reduced from £100 to 100 marks. In spite of the steady decay of feudalism, the crown retained its rights to reliefs and to the other feudal incidents until the time of the Stuarts. Under James I. Robert Cecil endeavoured to arrange with parliament for a commutation of these ancient but still lucrative rights for a fixed annual revenue, but the "great contract" was never carried through. During the rebellion and the commonwealth the crown rights and the machinery for enforcing them fell into abeyance, and it would have been preposterous to attempt their revival at the restoration. Accordingly, in 1660, the convention parliament passed the statute by which reliefs and other feudal payments were abolished and the hereditary excise was granted to the crown in their place.

[Stubbs, *Select Charters and Constitutional History*.—Pollock and Maitland, *History of English Law*, bk. ii. ch. i. § 7.—Round, *Feudal England*, pp. 308-311.] R. L.

RELIEF. See POOR LAW.

REMAINDER. The legal conception of a REMAINDER is dependent on the legal conception of an ESTATE (*q.v.*). An estate is conceived in English law as involving not only the ownership of lands, etc., but also the length of time for which that ownership will last. If a man holds land in *fee simple* his estate in that land is infinite in point of time; he may cut it in pieces of different time-lengths, and assign each piece to a separate person, who is said to possess his portion of the estate now, although he may not enjoy the land itself for years. After all the finite portions have been distributed, there will still remain a portion of infinite duration; this the original holder of the fee simple may keep for himself or assign to another; in the former case it is a reversion, and in the latter a remainder.

[For a more elaborate explanation see Sir Wm. Markby's *Elements of Law*.] A. E. S.

REMEDY (MINT). A term used to express the amount of variation permitted by law from the exact standard, either of weight or of fineness, of coins issued from the mint. Absolute conformity to the legal weight and fineness, in the case of every coin struck, is mechanically impossible, at the rate of speed at which coins are made. A reasonable margin of variation ("remedy") is therefore provided for by the coinage laws.

In the case of British imperial coinage, the remedies now in force are those fixed by the Coinage Act of 1891 (54 & 55 Vict. c. 72). They are set forth in the schedule to that act as follows:—

Denomination of Coin.	Standard Fineness.	Remedy Allowance.		
		Weight per Piece.		Millesimal Fineness.
		Imperial Grains.	Metric Grams.	
<b>GOLD :</b>				
Five-pound . . .	$\frac{1}{2}$ fine gold, $\frac{1}{16}$ alloy; or millesimal fineness 916.6.	1.00	0.06479	2
Two-pound . . .		0.40	0.02592	
Sovereign . . .		0.20	0.01296	
Half-sovereign		0.15	0.00972	
<b>SILVER :</b>				
Crown . . .	$\frac{1}{10}$ fine silver, $\frac{1}{10}$ alloy; or millesimal fineness 925.	2.000	0.1296	4
Double-florin . . .		1.678	0.1087	
Half-crown . . .		1.264	0.0788	
Florin . . .		0.997	0.0646	
Shilling . . .		0.578	0.0375	
Sixpence . . .		0.346	0.0224	
Groat or four- pence . . .		0.262	0.0170	
Threepence . . .		0.212	0.0138	
Twopence . . .	0.144	0.0093		
Penny . . .	0.087	0.0056		
<b>BRONZE :</b>				
Penny . . .	Mixed metal, copper, tin, and zinc.	2.91666	0.18899	None.
Halfpenny . . .		1.75000	0.11339	
Farthing . . .		0.87500	0.05669	

It will be seen from the above table that the remedy for the weight of the sovereign is 0.2

grain. The standard weight of this coin being 123.27447 grains, it follows that no sovereign may be issued from the mint which weighs more than 123.47447 grains, or less than 123.07447 grains. The remedy of fineness being 2 per mille, and the legal fineness 916.6, the metal of which a sovereign is composed must not be of a higher millesimal fineness than 918.6, or lower than 914.6. Though the entire range of variation thus permitted is not great, the extreme limits of remedy are seldom approached, especially in the case of gold coins. The verdict of the jury at the trial of the PRX (*q.v.*) held in July 1905, records that of the sovereigns then examined (coins struck during the preceding twelve months), the heaviest weighed 123.285 grains and the lightest 123.108 grains. The coin richest in gold proved to be of the millesimal fineness of 916.86, while the poorest only fell to 916.46, the coins being within the standard prescribed by law.

F. E. A.

REMITTANCE. The sending of funds from one place to another, whether in coin or bullion, in bank notes or drafts.

R. W. B.

REMONETISATION means the renewed use of some metal for purposes (1) of currency, (2) or as a standard in currency. (1) Thus Frederick II.'s Sicilian solidus, the Florentine (1252) and English (1257, 1343-44) florins represent the remonetisation of gold in Europe. (2) If European nations opened their mints to unlimited purchase of silver, which should be coined so that mint values = commercial values, and then made the silver coins unlimited legal tender, this would be the remonetisation of silver (see DEMONETISATION; SILVER AS STANDARD).

J. D. R.

RENAUDOT, THÉOPHRASTE (1584-1653) a physician and historiographer of France, who, through the interest of Richelieu, was appointed in 1612 general commissary of all the poor of the kingdom. Despite vigorous police ordinances, France and especially Paris were infested by legions of beggars, discharged soldiers, and persons ruined by the civil and foreign wars.

In 1630, Renaudot revived an idea originated by MONTAIGNE (*q.v.*) and obtained a licence "to open *Offices or Registers of Addresses* for the wants of all classes . . . and to practise or establish anything which might generally be useful or advisable for the regulation of the poor." His main object was to provide them with work through the agency of his *Bureaux*, after having in vain endeavoured to obtain employment for them, in cleansing the streets of Paris, a scheme he had been compelled to abandon by the Paris magistrates, eager at that time to oppose any project supported by the court. He explained his views in the *Inventaire des adresses du Bureau de Rencontre*, a very few

copies of which are still to be found in public repositories. Each entry in the registers cost only 3 sous, or for the poor was inscribed free. Renaudot also established, to assist the latter, his *consultations charitables*, and the first of the *MONTS DE PIÉTÉ* opened in Paris.

His *Traité des Pauvres* is lost. The success of Renaudot's *Bureaux* was such that he started in 1631 a *Gazette* to supply public news as well as the advertisements of the *Bureaux*; later on it took the name of the *Gazette de France*, and is the oldest French newspaper in existence. Renaudot also opposed the absurd medical theories then prevalent in the faculty of medicine at Paris, and sought to introduce instead the experimental method. He thus aroused an implacable animosity, which embittered the end of his life.

[Hatin, *Théophraste Renaudot* (1883) and *Histoire de la Presse*, vol. i. (1859).—Gilles de la Tourette, *Théophraste Renaudot* (1884).] E. Ca.

RENNY, ROBERT (died early in 19th century) wrote a *History of Jamaica, with Observations on the Climate, Scenery, Trade, Productions, Negroes, Slave Trade, Diseases of Europeans, Customs, Manners, and Dispositions of the Inhabitants. To which is added an Illustration of the Advantages which are likely to result from the Abolition of the Slave Trade*, London, 1807, 4to.

The work is divided into two books; the first deals with the discovery and subsequent history of the island up till the close of the Maroon War in 1796, and the return of the governor, Lord Balcarrais, in 1801. Book ii. treats of the climate, soil, scenery, and natural productions of the island; of the towns, churches, courts, trade, revenue, taxes, coins, and militia. Ch. iv. is divided into eight sections, each of which describes one of the commercial products of Jamaica. Ch. v. deals at some length with the history of slavery there; strongly emphasises the necessity of doing the negroes justice, and of setting them free. The author deplors the contempt which the white expresses for the coloured man. A. L.

RENOUARD, AUGUSTIN CHARLES (1794-1878), was born and died at Paris. He left the normal school during the first empire, and, devoting himself to law, he was, at the time of the restoration, much esteemed as a counsel in difficult cases.

About 1825 he published several works on moral and legal subjects, the most important of which is his *Traité des brevets d'invention*, 1st ed. 8vo, 1825; 2nd ed. 8vo, 1844. After 1830 Guizot took him up; he became a privy councillor, then a deputy, and finally a peer of France. In the chamber he introduced several laws, especially that on primary education, Guizot's highest title to fame. During this period Renouard published *Mémoire sur la statistique de la justice civile en France*, inserted in 1835 in Wolowski's *Revue de législation et de jurisprudence*; *Traité des droits des auteurs dans la littérature, les sciences et les beaux-arts*, 1838-39, 2 vols. 8vo, and finally, *Traité des faillites et banqueroutes*, 2 vols. 8vo, 1st ed. 1842; 2nd ed. 1844; 3rd ed. 1857. After 1848 Renouard practised again at

the court of appeal. It was he who, in the name of justice, brought in an indictment against the author of the *Coup d'état* of 1851, which brute force alone prevented him from following up. He kept aloof from public affairs during the whole of the second empire, and during that time he published *Du droit industriel dans ses rapports avec les principes du droit civil sur les personnes et sur les choses*, 8vo, 1860. After 1871, having been appointed *procureur-général* to the court of appeal, he spoke several times and with great weight. In the speech which made most stir, and by which even Berlin was moved, he refuted the famous aphorism, *La Force prime le Droit*. We are also indebted to Renouard for publishing the *Mélanges de morale d'économie et de politique* of Benjamin Franklin, preceded by a notice of his life, 3rd ed. 18mo. In 1861 he was elected to the *Institut* (*Académie des Sciences morales et politiques*), and in 1876 he became a senator. In 1845 he was elected vice-president, and in 1865 president, of the Economic Society of Paris. A. C. F.

## RENT

Rent, Basis of, p. 282; Rent does not enter into Cost of Production, p. 284; Rent of Ability, p. 285; Rent-Charge, p. 286; Rent-Charge, Medieval, p. 286; Rent, Labour, Medieval, p. 287; Rent of Land, p. 287; Rent, Sec, p. 289.

RENT, BASIS OF. "Rent," wrote RICARDO, "is that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil." "The income derived from the ownership of land and other free gifts of nature is called *Rent*"; is the form of definition adopted by Professor Marshall. Both writers take care to point out that the word is commonly used to cover payments of a different character. Moreover, the modern developments of economic analysis have shown that land is but a special and specially important member of a large class, and that the income derived from the ownership of special facilities of production not accessible to all, possesses economic characteristics which correspond closely to those of the rent of land. A growing custom of modern writers is to employ the word rent for the whole class. This course is not altogether unexceptionable, though it possesses conspicuous advantages for many purposes. In this article the reference to land will be retained, though the conceptions dealt with will be such as to have a much wider application. Such extension of their application is not to be understood as excluded by the restriction of the terms used to the problem of land-rent.

The basis of rent, as indicated in what precedes, is to be found in the fact that the product of equal outlays of effort or of capital under different conditions is by no means identical. In reference to land, one field may produce, under similar cultivation, 25, 50, 100, etc., per cent, more than another field of equal area, the soil of which is of a different nature, or whose advantages in other respects

are different. A difference of situation, affecting convenience of cultivation or access to markets, operates as effectively as a difference in the mechanical nature or chemical constituents of the soil.

The essential underlying basis of rent is this difference of return to equal effort, and the amount which rent can reach is measured by the amount of the difference. Clearly the doctrine, even so briefly stated as in the definitions quoted above, assumes the ownership of the productive facilities in question, assumes that they are not equally open to every producer in fact; and this carries with it the other point, that an indefinite extent of productive facilities of the most favourable nature is not available. The best is limited, and is made the subject of ownership. The necessity to utilise opportunities less favourable than the best existing brings the fact and degree of their superiority to the front, and gives it value.

As in the illustration used by Ricardo, we may suppose land of three qualities, numbered accordingly, to yield with equal employment of capital and labour:—No. 1, 100 quarters; No. 2, 90 quarters; No. 3, 80 quarters. So long as there is No. 1 land unappropriated and free to any one to use, no rent emerges. It is only when the needs of the community become such as to require the cultivation of No. 2 land, and, later, of No. 3, that rent appears. When the best land freely available is of No. 2 quality, the cultivator would get an equal return for himself by paying 10 quarters for the right to raise 100 quarters on No. 1 land, as by raising, rent free, 90 quarters on No. 2 land. Similarly, when the best land freely available is of No. 3 quality, the payment for the privilege of using No. 1 land might rise to 20 quarters; for using No. 2 land to 10 quarters; while whichever quality of land was used under such a scale of payments, 80 quarters would be the return to the cultivator's efforts which remained for himself.

The differences in the amount of labour needed to give equal results may be due to the necessity for the expenditure of considerable labour in conveying the produce to market, if the land be remote from the market for its produce. Thus, of two portions of land, A and B, on each of which 100 quarters is the return to the same expenditure of capital and labour, if the carriage of the produce of A to the market be covered by the sale of 2 quarters, while the carriage of B's produce absorbs the worth of 12 quarters, A will bear a rent of 10 quarters more than B. If B be no-rent land, A's rent will be 10 quarters.

Another view of the matter is not less important than this, since it brings out the importance of the law of DIMINISHING RETURNS, as applied to land in the determination of the rent of the land.

Let it be assumed that, when the whole of the No. 1 land is taken up, it is found that the expenditure of twice as much capital and labour as before on a plot of No. 1 land yields 195 quarters; that is, that the return is increased by 95 quarters. Capital and labour will thus, by the more intensive cultivation of No. 1 land, be able to procure a yield of 95 quarters, while, if expended on No. 2 land, but 90 quarters would be yielded. It will not, in this case, be necessary to resort to No. 2 land so long as the supply obtained by the more intensive cultivation of No. 1 is sufficient. Using the term "dose," after James MILL (see *DOSES OF CAPITAL*), to indicate the expenditure of capital and labour contemplated as yielding respectively 100, 90, and 80 quarters on the different qualities of land, we may now say that a dose of capital and labour can yield on No. 1 land, by more intensive cultivation, 95 quarters. This amount must therefore be sufficient to remunerate the cultivator who is induced to expend the dose for this return, or it would not have been expended. If it were insufficient, a single dose only, yielding its 100 quarters, would be expended on No. 1 land; if we assume that it is possible to regard labour and capital as applied in "indivisible" doses, for the purposes of the present argument. If 95 quarters remunerate the second dose, they will suffice to remunerate the first, and 190 quarters will remunerate the two doses, while 195 quarters are produced. The remaining five quarters may be exacted as the price of the privilege of using No. 1 land. Similar arguments apply to yet more intensive cultivation. Thus even without the necessity for assuming the existence of land bearing no rent, as a means of determining the level from which rent may be measured, a point from which to measure rent in any individual case is capable of determination, namely, the point at which, in the more and more INTENSIVE CULTIVATION of the land, the stage is reached at which the increase of return produced by the application of additional capital and labour to the land would just, and only just, be sufficient to make it worth while to apply such additional effort to the land.

Whether from difference in the nature or situation of different portions of land, therefore, or from different powers of response to effort expended on the same land varying with the stage of intensity of cultivation previous to the expenditure of this effort, the amount of rent and the reason for its existence rest on differential advantages for the application of this or that dose of capital and labour. If all land possessed equal advantages, and if the return to capital and labour expended on land were in accordance with the LAW OF CONSTANT RETURN, rent would not emerge.

The expression "original and indestructible powers of the soil," used by Ricardo, has given

rise to some destructive criticism of his theory. It is, perhaps, not necessary, though quite possible, to enter on a defence, necessarily somewhat lengthy, of the precise terms used. The essence of the doctrine of rent is not bound up with the adjectives in this phrase. Capital invested in improvements may alter the original character of the land. The inducement to make such an investment is afforded by the expectation of increasing the facilities for production which it offers so as to increase its returns sufficiently to yield at least interest at current rates on the investment. When the investment is made, however, it becomes difficult to differentiate between the original and acquired powers of the soil in many cases. The doctrines above enunciated may be applied to the improved land, if it be supposed that, in its cultivation, its actual powers are preserved unimpaired. The capital invested is as much bound up with the soil as its original qualities, and may conveniently be treated on the same basis.

The problem which has been dealt with here is, strictly speaking, the elucidation of the causes which determine the amount of a "producer's surplus," to use the phrase adopted by Professor Marshall, the said surplus being that which accrues to the producer by reason of his having the use of facilities superior to those of some of his competitors. Whether precisely this amount will be actually paid as rent will depend on the conditions of tenure of land and the relations between the various classes interested in agriculture at the time and in the place considered. If the owners of the land be in active and intelligent competition for tenants, and are unscrupulous in exacting the utmost possible payment from tenants, while tenants are also in active and intelligent competition to secure tenancies on the best possible terms, the producer's surplus on an average of years represents the utmost which tenants can pay without reducing unduly their own remuneration for labour and risk, and hence the most which owners can procure. It may be further observed that, as produce from one portion of land has been taken as the equivalent of that from another, the corresponding hypothesis is that the produce considered is sold in the same active market, so that the hypothesis of but one price for the same article may be reasonably made.

In regard to the rent of building land, the element of advantage of situation, important in the case of agricultural land, becomes the principal feature. In the case of mine rent, while partly determined by the facilities for extraction of minerals and their superiority to those elsewhere, the payment exacted is in part a charge for material actually carried away. The powers of the mine are not preserved unaltered, so that the case naturally

differs from that of the hire of productive facilities which are not destroyed by being used. In part, nevertheless, the superior ease of obtaining minerals from some mines as compared with others causes a part of the rent to be due to this difference, though the main portion be the price of material carried away. Wherever, in the hire of agricultural land, the contract provides for improvement of the land, or for exhausting previous improvements, a similar feature is introduced there to that which is most prominent in mine rents (see RICARDO).

A. W. F.

RENT DOES NOT ENTER INTO COST OF PRODUCTION.—This statement is commonly understood to imply merely that rent forms no part of that cost of production which is the measure of exchange value, that is, not average cost of production, but marginal cost of production. The theorem rests on the conceptions explained under the head Basis of Rent. A farmer, having contracted for the hire of land, is in the position that it is to his profit to expend any "dose" of capital and labour the return to which exceeds the cost of its application. He will, therefore, be induced to apply dose after dose, though the margin of surplus of return over outlay become narrower and narrower, so long as the margin is on the right side. The point at which he will cease to cultivate more intensively is determined by the vanishing of this margin. The "marginal dose" only increases the return by enough to cover the expenses of its application. The increase of return thus procured contributes nothing to rent, rent does not enter into its Cost of PRODUCTION. Although the expenses of the producer may contain—as against the whole crop—the stipulated rent, the "marginal production" is sufficiently encouraged if its price leave no surplus for rent, but merely covers other expenses. To quote the well-known passage of Ricardo, "Corn is not high because a rent is paid, but a rent is paid because corn is high." A rise in price of produce results in a smaller return being sufficient to remunerate the cultivator for applying a dose of capital and labour. This leads to increasing intensity of cultivation and a rise of rents.

From the other standpoint, that of the existence of no-rent land, which may be at any distance from the market, the fact that such land comes under cultivation proves that the cost of production of its crops are covered by their price. Rent forms no part of their cost, therefore it forms no part of the price of the whole market supply.

The price may, nevertheless, be affected by rent, if the existence of rent operate to stint the supply of the produce of land, that is, if the owners of land be able to command a price for the privilege of cultivating even the poorest

land. Such a "monopoly-rent" may affect the price of the commodities produced under its influence. The same principles, too, come into play as the result of the fact that land may be applied to alternative uses. If for one of these uses certain land be sufficiently productive, in comparison with other land actually in use for the same purpose, to command a rent, the condition of its use for any other purpose is that it should pay at least as large a rent in the latter as in the former case. If it be less productive than the worst land already in use for this other purpose, it cannot be economically used until the price of the product in question rise to a sufficient height to enable it to yield not only the expenses of applying the necessary labour and capital, but also the rent obtainable by the assumed alternative use of the land. The cost of production of the most expensive portion of the supply does in this case include rent.

In general it is true that rent may be reduced and the margin of cultivation raised if fresh sources of supply, involving a smaller cost than that involved in the use of some of the sources actually in use, be brought into the market. If these fresh sources of supply be held out of use on account of their yielding a greater rent for some other purpose, the fact of rent does stint supply and raise price.

The introduction of the consideration of such an indirect influence of rent on price appears to be of considerable importance. It is from the treatment of land as if yielding a produce of one kind only that its influence is lost sight of in the general enunciation of the doctrine. It remains true, however, that if the cultivators of land were set free from their obligation to pay rent, such a change would not introduce motives tending to divert land from the purposes where it yields the greatest surplus to the producer over the expenses of its cultivation. Thus though the fact of alternative uses for land does reduce the supply of any one of its products below the amount which it might reach if all land were capable of use simply for the supply of this product alone, the abolition of the obligation to pay rent would not affect the relative supply of different commodities, except in so far as the rent is a true monopoly rent.

[Special reference may be made to Ricardo's *Works*; to F. A. Walker's *Land and its Rent*; and to Marshall's *Principles of Economics*, bk. v. ch. iv., as well as to the article on *COST OF PRODUCTION*, where some important points, not repeated above, are dealt with. Most leading authorities on economic theory have contributed some chapters to the discussion of the theory of rent.]

A. W. F.

**RENT OF ABILITY.** In analysing the rewards of efforts and abstinences made for the satisfaction of wants under modern social

conditions, economists have to reckon with that residual element of returns which is due to peculiar advantages of nature or the juncture of events, and not to any additional effort or abstinence. In agriculture this surplus revenue is called **RENT**, it being really accidental in economic theory whether it is handed over by farmer to landlord or appropriated by a freeholder. The term "rent," however, as defined in economics, cannot justly be confined to agriculture only, but, as N. W. SENIOR proposed, should be, and is indeed more or less, used to cover all cases of this residual element of reward which "nature or fortune bestows" in the shape of an exceptional or "differential" profit beyond the given average rate of remuneration. Rent of land thus appears as only a species, if "the most distinct and impressive" species (see von MANGOLDT), of a genus of reward, the conditions of which are those of a natural monopoly with a demand temporarily or permanently in excess of the supply.

In land-rent those conditions are superior natural fertility and advantages in connection with the disposability of produce; in other species of rent they are "extraordinary qualities of body and mind" (SENIOR, see below) to which may be added those accidents in demand or fortunate contingencies in time and space now classed as *Conjunctur*. Usually both sets of conditions are requisite. The inventive faculty that brings out a patent just when the public taste is amenable, the organising ability that can push an enterprise in advance of competition on the short-lived tide of public credit, the singer who, with a peculiar charm in organ or appearance, draws crowds while a possibly greater artist transcends the popular discernment, the author of a book abreast with, but not ahead of the age, the strategic genius launched on a military career just when a war breaks out—all that is conveyed by the expression "time and the man"—are cases where the surplus revenue, analogous to rent if not so-called, appears. And, as in agriculture, the difference is merely accidental, if in one case the owner exploits his own sources of rent, in another farms them out.

For the most part economists have preferred to class this residual reward under profits, only pointing out its analogy to rent derived from land. Mill refers to it as "cases of extra profit analogous to rent"; von Mangoldt, as entrepreneur's rent or as *Seltenheitsprämie*; Walker, as "profits partaking of the nature of rent"; Marshall, as a species of "quasi-rent" specially prominent in profits of business men; Nicholson, as "*Conjunctur*-profit" (see *CONJUNCTUR*). Yet it does not strictly fall under earnings of management, since it is not a monopoly of managers, and is, strictly speaking, an unearned increment of reward. Nor can it be claimed as interest unless what has been called

personal wealth be ranked as capital, for it is not the reward of capital invested in developing rare ability. To get extraordinary advantages in training may indeed be viewed as a lucky conjuncture for the talented youth. But for purposes of analysis, a distinction should be drawn between such good fortune and the sacrifice incurred by both parent and child in availing themselves of the best possible opportunities of education.

However classified, rent of ability and of fortunate contingency is a factor which under a system of competition militates ever more and more against any tendency to equality in returns, whether these are called wages or profits. The greater the investment of capital in the training of natural abilities, the more general the opportunities to cultivate the same, the more "differential" becomes the profit of those who in themselves and in the turn of events possess that species of monopoly analogous to that arising from the possession of the most remunerative portions of the earth's surface. For a pianist to be offered in England a thousand guineas in remuneration for one evening's display—as happened recently—would some years ago have been an impossibility.

On the first appearance in economic literature of this metaphor, see BAILEY, S., on VALUE.

A. F.

RENT-CHARGE. The payment of an annual sum is frequently secured by a charge on land belonging to the promisor. Such a charge is called a "rent-charge," and may, since the coming into operation of the Stat. 4 of Geo. II. c. 28, § 5, be enforced by DISTRESS (*q.v.*) in the same way as a rent reserved in a lease, whether the power of distress be expressly given by the deed creating the charge or not. A rent-charge granted otherwise than by will or marriage settlement is not binding on subsequent purchasers unless registered in accordance with the provisions of 18 Vict. c. 55, §§ 12 and 14. E. S.

RENT-CHARGE, MEDIÆVAL. The purchase of a rent-charge (*rent, census, Zins*) was one of the methods of investing money most frequently resorted to during the later middle ages. From the transfer from one person to another of the right to receive a rent already due the step was but a short one to the creation of an altogether new rent-charge, for the express purpose of raising money by the sale of it. At first, possibly, such charges were laid only on

agricultural land; but the plan commended itself to townsmen; and the creation of rent-charges on town lands and even on town houses and shops became very general. It early came to be the practice to specify in the deed of sale the sum at which the seller could redeem the charge: and it was frequently enacted by civic or territorial authorities that all charges should be redeemable at so many years' purchase; so that there grew up in every district a current rate of return upon investments of the kind.

The practice would seem to have arisen spontaneously, and to have been by no means a mere evasion of the prohibition of usury. When brought before the attention of theologians and canonists, as in the cases submitted to Pope Martin V. in 1425 and Pope Calixtus III. in 1455, no doubt was felt as to its legitimacy, on the following conditions: that the charge was a *census realis*, *i.e.* was attached to some definite and permanent property of such a nature as to be a source of permanent income (*res frugifera*); that the person subject to the charge retained the right of redemption, but the recipient had no right to compel a return of the purchase money; and that the rent did not exceed a fair percentage upon the purchase money,—as to which last point the ecclesiastical authorities were ready to accept current usage. The existence of a "real" security, which, if transferred, carried the obligation with it, and the interminable character of the investment, so far as the investor was concerned, were the two features which were held to distinguish the contract from a mere *loan*. But Nicholas V. in 1452 permitted the people of Aragon and Castile, in order to escape the greater evils of usury, to make rent contracts based on their movable property, or indeed simply on their general credit, the so-called *census personales*; and such contracts were defended, outside Spain, by several eminent theologians of the sixteenth century. The return of Pius V. in 1568 to the earlier and severer view was too late to restore old conditions. But the theoretic discussion of the subject lost all interest, as the practice itself was gradually abandoned in favour of the freer form of investment rendered possible by the development of the theories of INTEREST and PARTNERSHIP (*q.v.*).

[The best history of mediæval practice is probably to be found in Max Neumann's *Geschichte des Wuchers in Deutschland* (1865), though it suffers under the twofold defect of maintaining that the practice was peculiar to Germany, and that it was opposed to canonist doctrine. W. Endemann, *Studien in der romanisch-kanonistischen Wirtschafts- und Rechtslehre*, vol. ii. (1883), enters at length into the canonist discussion of the *Rentenvertrag*. On these works is based the account in Ashley, *Economic History*, vol. i. pt. ii. (in Amer. ed., vol. ii.), §§ 66, 74, 75. The German and French mediæval law are given in Schröder,

*Lehrbuch der deutschen Rechtsgeschichte*, 2nd ed. (1894), 696; and Viollet, *Histoire du droit civil Français*, 2nd ed. (1893), 679-683, respectively.]

W. J. A.

RENT, LABOUR (Mediaeval). Under the manorial system of agriculture, the lord's portion of the estate was cultivated by the compulsory labour of the tenants, under the supervision of the bailiff. Such services were perhaps, even when valued in the accounts in terms of money, rather payments incidental to tenure than economic rents in the modern sense. Compulsory services, paid for with food or money, or both, are frequently met with, but unpaid labour was more usual. It was of two main classes, fixed "week-work," and unfixed "boon-work" or "*precaria*"; the former was, on the whole, but not always, or in all places, required of unfree tenants only, while free and unfree, socager and villein alike, had to perform special services, boon-work, when called upon, and particularly at harvest-time. In cases where an unlimited amount of week-work might be demanded, it seems probable that the tenant was exempt from boon-work, but even the latter tended to become fixed, though remaining occasional. Every service which the lord of the manor needed might be required of the tenants, but the commonest were ploughing and carriage. The process of commutation of services for money rents no doubt began very early, it is impossible to say how early; but the labour rent system was not seriously broken down until the 13th or 14th century.

E. G. P.

RENT OF LAND. A. Smith summed up the best views of his time with regard to "the rent of land," when he described it as a compound of two elements—interest on improvements and payment for what Ricardo afterwards called "the indestructible resources of the soil"; or A. Smith's "original," and Mill's "economic" rent. This last rent is, according to A. Smith, "a monopoly price,"—the effect and not the cause of the price of a commodity

(i. xi. *init.*). His language is not always consistent, and he does not analyse the nature of this monopoly, but three of his illustrations imply a correct though incomplete analysis. The first is taken from his own experience, and is the lease of a foreshore. The next is a historical generalisation—"every improvement," he says, "in the circumstances of society, tends either directly or indirectly to raise the real rent of land" (i. xi. *fin.*); and takes us back to Locke's belief that high rents mean prosperity, and should therefore be an object of legislation (*Works*, ed. 1824, vol. iv. p. 69), (Tooke, i. 24), and it takes us onward through M'Culloch's famous table (edition of A. Smith, p. 452), to H. George's *Progress and Poverty*; and it also reflects the physiocratic view that rent is a "produit net," a view which is still expressed when economists write of rent as "a residue" or as "an excess of value above the cost of production." This half-truth will not save its advocates from error; nor will its opponents attain truth without it. A. Smith's third illustration is practical, and is contained in his suggestion that a special rent-tax would, if variable and moderate, fall exclusively on landlords, and would not discourage industry, so that "the real revenue of the great body of the people might be the same after such a tax as before" (v. 2 *fin.*). Attempts to realise this idea by tentative fiscal measures on a small scale, and, best of all, subject to local control, have proved successful; thus Giffen (*Essays in Finance*, i. 252) points out that "rates" are just such a land-tax, and have as a matter of fact kept pace with the increase of the unearned "Mehr-Verth" of land during the past fifty years, while the French "contributions foncières," which were apparently Smith's model, advanced at a far slower rate under like conditions. On the other hand, if A. Smith's idea is interpreted by an heroic "impôt unique," designed to secure all economic rent to the state, on the ground that individuals ought not to reap what they did not sow—such a scheme is foredoomed to failure; because any attempt to draw a hard and fast line between "economic rent" and "interest on improvements," is hopeless. Here are three attempts; Giffen said that at the then rate of increase (1871) land then worth £150,000,000 would in thirty years be worth £100,000,000 more, half of which would perhaps be unearned (*Statistical Essays*, i. 258). Caird in describing the increase of landlord's property from £55,000,000 annually in 1857 to £66,000,000 annually in 1875, estimated the unearned at  $\frac{1}{4}$ ths of the whole increment during that period (*Landed Interest*, p. 97). Leroy-Beaulieu (*Répartition des Richesses*, 1888, p. 119), following more or less Carey's *Past, Present, and Future* (1848), and Hippolyte Passy's *Des*

*Causes de l'Inégalité des Richesses* (1848), thinks that economic rent is already at vanishing point; but as he bases his thesis on the supposition that capital invested on improvements should bear interest (compound?), for 2000 or 3000 years, his arguments do not claim much weight. Similarly German princes (Roscher, *Geschichte der Nat.-Oek. in D.*, pp. 485, 631) and Indian administrators (Baden-Powell, *Land Revenue*, p. 179) have been baffled by the insuperable difficulties of valuing the "produit net" for the purposes of an "impôt unique." In any case, doctors disagree on the matter, and the wisdom of A. Smith's "variable," "moderate," and "might," is conspicuous in comparison with proposals, such as that of Mill's "Land Tenure Reform Association" (1870), to take the whole future "unearned increment" in taxation.

In what then has A. Smith's view been advanced by his successors? First, deductively by the so-called Ricardian theory of rent, discovered by Dr. Anderson in 1777 and 1801, re-stated by Malthus and West in 1815, and finally by Ricardo in 1817. This theory, so far as it states that the amount of rent of a situation depends upon its "differential advantages as compared with that situation where a given pursuit just pays," suggested the idea of "marginal utility" which is the foundation of the law of value, as stated by Jevons and Marshall; and added even more to the elucidation of "value" than of "rent." Secondly, there is the truth, partly deductive, partly inductive, emphasised by Ricardo and Mill, that improvements in mechanism and locomotion increase supply, and so send rents down until an increased demand sends them up again; to which Carey added that as civilisation goes on suitable soils are specialised to suitable growths, and new fertile lands, like Laveleye's "polders," are discovered; a process which produces the same effect as any other improvement (Carey, *Principles of Pol. Econ.*, 1837). Thirdly, there are several inductive additions to A. Smith, which are equally additions to Ricardo. (1) Ricardo's hypothesis that land always remains in cultivation which only pays wages and not rent, is as incorrect a statement of fact as A. Smith's guess that the opposite was necessarily the case with regard to agricultural land (see Roscher's *P. E.*, § CL., n. 2). (2) Ricardo overrated advantages arising from fertility, and forgot J. B. Say's maxim "L'éloignement équivaut à la stérilité," a maxim which at present determines English rents. Thus in 1881, Caird estimated landlords' improvements at £15 an acre (*Landed Interest*, p. 56), i.e. 10s. per annum (if his usual estimate of thirty years' purchase-value applies), and their "protection from cost of freight of wheat" at 42s. per annum per acre (*British Land Question*, p. 16). This would make economic

rent vary, with the cost of freight, between 32s. per acre and zero, so far as wheat lands were concerned. (3) Cairnes's proof that Australian rents have raised prices contradicts Ricardo's view that rents never affect prices. Walker points out (p. 41) that Cairnes's exception only applies where the state is landlord, and rent is therefore a tax. But could not landlords combine to tax a community, or portion of a community? And is the distinction between taxes which may, and rents which may not raise prices, quite clear? Seebohm, whose figures must be received with caution, at all events proves that the same sort of mediæval English impost branched out into landlords' land-tax and farmers' rents (*Fortnightly*, January 1870); and according to Thorold Rogers farmers' rents were in no sense competitive before the 17th century. Again, the Devon Commission, 1845, proved that the effect of competition in Ireland was that impossible, and not merely as economists supposed the highest payable rents were habitually offered. Again, in British India the land revenue is universal, and yet the best administrators are unable to tell whether it is to be classed as a rent or as a tax; and those who collect it are sometimes treated like landlords subject to land-tax, sometimes like lessees who have under-tenants, and sometimes like excisemen who deduct their own pay (Baden-Powell, *l.c.* p. 49). Considerations such as these narrow the applicability of the doctrine of "economic rent," and suggest that rent may after all turn out to be more often than not a tax in disguise. (4) Ricardo's implied doctrine that in the distribution of wealth the rent-receiver is the residuary legatee of the capitalist and wage-earner, is ably combated by Mr. Hobson in his essay on the three rents (*Econ. Quarterly*, April 1891). His point is that interest and wages rise in the same sort of way as so-called rent. We may answer: "Yes, but not at the same rate." Thus beginning with the settling down of prices after the discoveries of precious metals in the new world:

Year.	Wages per week.	Rent per acre.
	s. d.	s. d.
1650 <sup>1</sup>	at least 4 0	5 6 <sup>2</sup>
1770	7 3	13 0 <sup>3</sup>
1878	14 0	30 0 <sup>3</sup>

Or to take a shorter period:—Wages rose 34 per cent, rent 100 per cent, between 1770 and 1850-51 (Caird's *English Agriculture*, 1850-51, p. 475). What is the reason of the extra pace at which rent runs, when once wages and rent move? Some will point out that during the last three centuries rent began to include

"profit upon capital laid out in improvements" to a far greater extent than previously, and that this accounts for the difference; others, alleging that 5s. 6d. rents represent a greater rise on mediæval rates than the current rate of wages at that time (Th. Rogers, *l.c.* v. 815), attribute this phenomenon to the superior agility of the landlords. Perhaps both causes were at work. Anyhow the wisest economists treat these and similar questions historically, and admit that hitherto history supplies results which do not justify confident predictions as to the future. J. D. R.

RENT SEC. A rent secured by rent charge not expressly giving a right of distress (see DRY RENT). E. S.

RENTAS ESTANCADAS, Spanish state monopolies for the production and sale by government of tobacco, salt, stamped paper, etc. The state monopolies of lead, brimstone, gunpowder, and quicksilver were called *rentillas*. The earliest state monopolies were created in 1632. E. ca.

RENTE (Fr.). In primitive times, the annual fee paid by the vassal to the seigneur, or the tenant farmer to the landlord; now almost exclusively applied to the interests on the consolidated debt or *rentes sur l'Etat*, the word *loyer* being employed for the hire of land or buildings. The consolidated public debt dates from the creation of the GRAND LIVRE (*q.v.*) in 1793. The total nominal capital then amounted to 2,558,080,000 francs (£102,242,400), which increased to 3,494,320,000 francs (£139,772,800) in 1797, when two-thirds of the debt was paid off by ASSIGNATS or national bonds of little or no value, and the remainder was refunded under the designation of consolidated thirds. The nominal capital was thus reduced to 1,164,773,333 francs (£46,590,933), the rate of interest at 5 per cent remaining unchanged. In 1814, at the first abdication of Napoleon, the debt had only increased to 1,226,152,740 francs (£49,046,109). The borrowing during the restoration for the liquidation of the empire and the two invasions, had raised the debt in 1830 to 4,426,297,611 francs (£177,051,184). Down to 1825 the rate of interest had always been 5 per cent. In that year the first 3 per cent rentes were created for payment of the indemnity to partially compensate the royalists and *suspects* whose property

had been confiscated during the revolution and sold for the benefit of the state as *biens nationaux*. The sum thus raised is known in history as the *milliard des émigrés*, and the operation was combined with an optional conversion of the existing five per cents into threes at 75, or four and a half at par, guaranteed for ten years against any further reduction of interest. The conversion was only accepted for a small portion of the debt, and a 4 per cent loan having been issued in 1829, four different stocks in rente existed down to 1862. In that year there was a compulsory conversion of the five per cents by reimbursement, with the option of an exchange for four and a half per cents. The next conversion in 1862 was an optional one without reimbursement. Holders of four and a half and four per cents were offered in exchange three per cents to produce the same amount of rente or annual interest on payment of a premium called a *soulte* of 5 francs 40 cent for each unity of 4½ per cent rente, and 1 franc 20 cent for the four per cents. The conversion was accepted for about three-fourths of the two stocks in circulation, and the *soulte* produced a sum of 157,820,296 francs (£6,312,811) to the treasury without any increase in the annual charge, but at the cost of a considerable augmentation in the capital of the debt. After this operation there still remained in circulation 38,443,707 francs of 4½ per cent in rente or interest, and 453,027 francs in four per cents. Between 1854 and 1859 four loans were issued in 4½ or 3 per cent stock at the option of the subscribers, and from the latter year down to the war of 1870 all the creations of rente were in three per cents. In October 1870 the government of national defence raised a loan of 250,000,000 francs nominal in London in 6 per cent bonds at 85. This loan was to be paid off by annuities in thirty-four years, and did not give rise to any creation of rente. It was reimbursed in 1875 by an appropriation of 14,541,780 francs of rentes belonging to the savings' banks, and held by the *Caisse des Dépôts et Consignations*, which received an annuity of 17,300,000 francs for interest and redemption for thirty-nine years. The bondholders obtained the same interest of 6 per cent as before in 3 per cent rentes, but, as in 1862, had to pay a *soulte* which produced to the treasury a bonus of 60,000,000 francs. The war indemnity loans of 1871 and 1872 increased the capital of the consolidated debt by 6,720,032,100 francs (£268,801,284) in five per cents, which were reduced in 1883 to four and a half per cents, and again in 1894 to three and a half, with a guarantee against any further reduction for eight years.

Originally all rentes were inscribed into names in the "grand livre," but in consequence of complaints of the formalities required to obtain

payment of the interest in the provinces or transfers of the capital, a law of 1831 authorised the creation of bonds to bearer with coupons, and in 1864 a new category called *rentes mixtes* (mixed) was authorised, the capital of which is inscribed but with certificates carrying coupons for the payment of interest. The sheets of coupons of the three and the three and a half per cents are for five years, and those of the *rentes mixtes* for ten years, after which they require to be renewed. Money being required in 1878 for M. de Freycinet's great scheme of spending four milliards (£160,000,000) in ten years on railways, roads, canals, and improvements in navigable rivers, another class of rentes was created by M. Léon SAY namely, that of redeemable three per cents, the capital to be reimbursed in seventy-five years. This loan was issued as required in 175 numbered series for the drawings according to a table of redemption, the number of series to be paid off annually to increase progressively. There are no redeemable three per cents in *rentes mixtes*. A nominal sum of 4,070,690,000 francs (£162,827,600), which produced 3,286,580,884 francs, was thus raised between 1878 and 1884, but the system of redeemable rentes was abandoned in 1888, when a new loan of 500,000,000 francs was raised in ordinary three per cents as in all subsequent borrowings. The remainder of the old  $4\frac{1}{2}$  and 4 per cent outstanding from the conversion of 1862 was refunded in three per cents in 1877, and only three classes of rentes ordinary and redeemable 3 and  $3\frac{1}{2}$  now remain (1897) in circulation.

Rentes enjoy certain privileges over other classes of public securities. They are exempt from all taxes on capital or interest excepting those on succession and donations, and in the numerous schemes put forward for a general income tax their authors have invariably proposed to exclude rentes for the reason that, as the government had promised a certain rate of interest it would be a breach of faith towards the public creditor to levy a tax on the interest. Governments have also been influenced in exempting rentes by the consideration that future loans would have to be issued under less favourable conditions if the interest was exposed to taxation. A claim for the capital of rentes is not barred by lapse of time, but the interest cannot be claimed after five years from the date for payment. Rentes cannot be the object of a judicial seizure, and an injunction to suspend payment of interest is not allowed. They are expressly exempted from the operation of the law of 29th June 1872, relative to lost or stolen public securities. The bourse tax of five centimes per thousand francs paid by both buyer and seller in the same negotiation is also reduced to one-fourth of that rate for dealings in rentes. The

smallest inscription of inscribed rentes admitted is three francs in interest for 3 and  $3\frac{1}{2}$  per cent; if to bearer, three francs in 3 per cent and two francs in  $3\frac{1}{2}$  per cent. Bonds of the redeemable threes are for 15 francs interest or 500 francs capital and multiples of the same. The capital of the three classes of rentes in circulation is about 25 milliards of francs (£1,000,000,000), but this does not constitute the total public debt of France, which, with the floating debt and the annuities capitalised, is estimated at over 30 milliards (£1,200,000,000). The number of inscriptions of inscribed rentes and bonds to bearer is about 4,500,000, but many *rentiers* or fundholders possess several inscriptions or bonds. The number of holders of rentes is believed to be about two millions. In no country is the public debt so widely disseminated among all classes of the people as in France.

REPRODUCTIVE INDUSTRY. See PRODUCTIVE, THE TERMS, Articles on.

REPUDIATION, UNITED STATES. This term, as commonly used in the United States, refers to the refusal of certain commonwealths and cities to redeem bonds issued under their respective authorities. Only once has the national government declined to pay in full its obligations, and that was at the beginning of its existence, in providing for the redemption of the continental currency issued during the revolution at a rate of 1:100 of its face value. The integrity of states and cities has not, however, been so strictly kept, partly because of the financial and commercial confusion incident to the establishment of new communities, and partly because of constitutional and political reasons not always clearly understood by foreign investors. Owing to the strong "states' rights" feeling existing in the United States and a desire to protect the dignity of the federating commonwealths, an amendment to the constitution of the United States (the eleventh, 1798) was adopted providing that "the judicial power of the United States shall not be construed to extend to any suit in law or equity against one of the united states by the citizens or subjects of any foreign state."

[The history of repudiation, its causes and remedies proposed, is very fully treated by William A. Scott in *The Repudiation of State Debts*, New York, 1893, p. 325. For State Repudiation see Sidney Smith. Repudiation has also been practised in other countries with disastrous results to their credit.]

D. R. D.

REQUISITES OF PRODUCTION. See PRODUCTION, INSTRUMENTS OF.

RES NULLIUS. A term of Roman law used to denote any object which has no proprietor, either because it has never been acquired by any one, as a wild animal at liberty, or a coloured pebble washed up by the sea, or because the proprietor has deliberately relinquished his right of property in it, e.g. a pair of worn-out shoes thrown on the roadside.

F. C. M.

RESERVE. The reserve of a bank is essential to its safety, but the amount must be left to the discretion of its managers. Few would be inclined to hold now the opinion of RICARDO, who, in his evidence before the committee of the House of Commons on cash payments in 1819, said, "I should think that a reserve of *three millions* would, under good management, be amply sufficient upon a supposition of *twenty-four millions* of Bank of England notes in circulation" (Tooke's *History of Prices*, vol. iv. p. 477, note).

The reserve of the Bank of England has of recent years been far larger in amount than the amount contemplated eighty years since. The average for the year 1894 was £25,800,000; for 1895, £29,900,000; for 1896, £34,600,000; and for 1897, £25,152,800. This sum, which, though nominally described as "notes," really consists of specie, represents a very large part of the reserves of the other banks of the country, which at times probably even exceed the amount of the reserve of the Bank of England. The "cash in hand, at call and at short notice," held by the banks of the United Kingdom at any usual time, may in a regular way amount to about £200,000,000. This sum includes the "till-money" of the banks, which is no doubt considerably larger now than in former years.

The natural objection on the part of those who have the management of banks to allowing any part, more than is actually necessary, of their deposits to remain "idle money," accounts for the smallness of the amount held in reserve, but there are many signs that an increase of it is very desirable.

[See *Banker's Magazine*, April number, 1894-1898.]

RESERVE LIABILITY. See LIABILITIES ON SHARES.

RESERVES (BANKING). The banker's cash reserve is that portion of his resources which he holds uninvested. In ordinary times the daily receipts may be roughly reckoned to provide for the day's demands, but there is the possibility of extra requirements, and for these a fair provision of cash in hand is necessary. In London the cash in hand includes, and mostly consists of, the balance at the Bank of England; with country bankers the cash reserve is largely kept on balance with their London agents.

The banking reserve held by the Bank of England consists of the bullion and coin in the banking department, which is really the "till-money" of the bank itself, and of the notes in hand in the same office. As these notes can be immediately exchanged at the issue department for gold, the reserve is practically held in gold.

It is not possible to lay down a proportion which the cash reserve should bear to the deposits. The experience of the banker can alone decide what is necessary or desirable, and this experience differs in different localities, and in different classes of business in the same locality. The ratio of the reserve of the Bank of England has been somewhat reduced in recent years. This is much to be regretted in view of increased and increasing demands on our market.

In 1885 it was	Highest	52.51 per cent
	Lowest	32.98 ..
	Average	44.93 per cent
In 1906 it was	Highest	51.00 per cent
	Lowest	29.87 ..
	Average	43.55 per cent

In the same years the cash reserve held by the London joint-stock banks having businesses in London only, was, both years, 15.3 per cent of the deposits. Besides the cash in hand there is a second line of cash reserve in money at call (see LIQUID ASSETS). In the national banking system of the United States the proportion of reserve is prescribed by law, and must consist of specie, legal tender notes, or gold and silver certificates; the ratio ranging from 15 per cent to 25 per cent; the former being for banks in the provinces, who may reckon therein their balances with agents in the reserve cities (see BANKS, NATIONAL).

R. W. B.

RESIDUAL AND WASTE PRODUCTS (By-PRODUCTS) may be defined as those materials which in the cultivation or manufacture of any given commodity remain over, and which possess or can be brought to possess a market value of their own, apart from the value of the article from whose manufacture or in connection with whose cultivation they have resulted. In this way straw is a residual or by-product resulting from the cultivation of grain. J. E. Cairnes, *Some Leading Principles of Political Economy*, 1884, p. 128, refers to them as "accessory products," and defines them as commodities which are produced, not separately, but as parts of a common industry, and of which the most obvious examples are mutton and wool, beef, tallow and hides, gas and coke, and the like.

J. S. Mill, in his chapter on "Some Peculiar Causes of Value," *Principles of Pol. Econ.*, vol. ii. bk. iii. ch. xvi., treats of the joint cost of production of two such articles, and shows how

"the outlay is incurred for the sake of both together, not part for one and part for the other"; that cost of production does not determine their prices, and that to determine their prices we must "revert to a law of value anterior to the cost of production and more fundamental—the law of demand and supply. The gas may find an easy market, but purchasers may not be forthcoming for the coke, and *vice versa*. In this case, the coke being lowered in price to force a market will lower the whole rates of profit on the joint production; it will cease to be remunerative and less gas will be produced, whereupon gas prices will rise, the stationary condition of the supply of coke will clear the market of it and cause a demand for more; the rise in gas and coke will attract capital, but, as to supply the demand for coke gas must be manufactured, gas prices will fall, and this time it will be the coke which has supplied the lion's share of the profitable return on the manufacture."

"Equilibrium will be maintained when the demand for each article fits so well with the demand for the other that the quantity required of each is exactly as much as is generated in producing the quantity required of the other" (p. 109 *ib.*). Mill then sums up: "When, therefore, two or more commodities have a joint cost of production, their natural values relatively to each other are those which will create a demand for each in the ratio of the quantities in which they are sent forth by the productive process."

Charles Babbage, in his *Economy of Machinery and Manufacture*, London, 4th ed. 1835, refers to waste products, p. 11, par. 2, such as the employment of hoofs of horses and cattle, and other horny refuse, in the production of the prussiate of potash; and also to the re-use of old iron and old tin-ware. On p. 217, par. 270, he writes: "Among the causes which tend to the cheap production of any article, and which are connected with the employment of additional capital, may be mentioned the care which is taken to prevent the absolute waste of any part of the raw material. An attention to this circumstance sometimes causes the union of two trades in one factory. . . . An enumeration of the arts to which the horns of cattle are applicable will furnish a striking example of this kind of economy. The tanner who has purchased the raw hides separates the horns, and sells them to the makers of combs and lanterns. The horn consists of two parts—an outward horny case, and an inward conical substance, somewhat intermediate between hair and bones. The first process consists in separating these two parts. . . . The horny exterior is then cut into three portions. . . . The lowest of these is made into combs; the middle of the horns forms a substitute for glass in lanterns of the commonest kind; the tip of the horn is

used by the makers of knife handles, and of the tops of whips. . . . The interior or core of the horn is boiled down in water. A large quantity of fat rises to the surface. This is put aside and sold to the makers of yellow soap. The liquid itself is used as a kind of glue, and is purchased by cloth-dressers for stiffening. The insoluble substance which remains behind is then sent to the mill, and, being ground down, is sold to the farmers for manure, as also are the comb shavings from the horn."

This example will serve as an instance of the economic uses of a "waste product." Chief products and waste products are, however, relative terms. What is a waste product to one man may be a chief product to another.

A. L.  
[P. L. Simmonds, *Waste Products and Undeveloped Substances*, London, 1873; see also *By-Product*; *By-Products*, *Theory of Value of*; *Progress, Influence of, on Value*; *Shoddy*.]

**RESIDUAL SHARE (Wages).** A well-known American economist, the late F. A. WALKER, has advanced the theory that wages equal the product of industry *minus* rent, interest, and profits, or in other words that "the labourer is the residual claimant of the product of industry." Hence he concludes that if the total amount of the production of a community be increased, the increase will go, not to the landlords, nor to the capitalists, nor to the employing class, but to the labouring class in enhanced wages. As a practical illustration he points to the western states in America, where "employers were paying their labourers by the year, giving the full wages only when the crops were harvested or the goods marketed, making meanwhile such advances as their means allowed, or as were required by the varying wants of their workmen." He allows that in England and other settled countries, the practice is wholly different, and that the labourers fail to obtain that share in the product to which, according to his theory, they are entitled. But he attributes this to imperfect competition, and especially to the immobility of labour and its consequent failure to find the best market. Given perfect and enlightened competition, he holds that the labourers and not the employers will receive the residue of the product, and that the other shares, no matter how they are actually paid, may be regarded as preliminary deductions.

This theory of wages has its basis in Mr. Walker's theory of profits. He holds that profits are akin to rent, that they vary with the abilities or other advantages of individual employers, and they do not form part of the price of goods. Just as the normal price of agricultural produce depends on the cost of production on those lands which pay no rent, so the normal price of manufactured goods depends on the cost of production in the hands of those employers who earn no profits. More-

skilful and energetic employers make the goods cheaper and sell them at the same price. Hence they earn a reward which is due entirely to their own merits, which cannot be confiscated, and which inflicts no hardship either on the labourers or on the consumers. The only way in which these profits can be reduced is by raising all round the average skill and ability of the employing class generally, so as to diminish the exceptional gains of the great captains of industry.

For this view of profits there is much to be said, and it unquestionably accounts for some prominent characteristics of modern industry.

But Mr. Walker has pressed the analogy between profits and rent too far. Because rent is measured from no-rent land, therefore he holds that profits must be measured from a "no-profits" class of employers. To quote his own words, "no small part of the posts of industry and trade are filled by men inadequately qualified, and who, consequently, have a very checkered career and realise for themselves, taking their whole lives together, a meagre compensation, so meagre that, for purposes of scientific reasoning, we may treat it as constituting no profits at all." But this assumption seems to go too far. It is quite true that employers sometimes conduct an industry at a dead loss, and find their way to the bankruptcy court. But it is equally true that many people make foolish investments and lose both interest and principal. It is equally true that some landowners cultivate their own lands, and lose money every year in the process. But these exceptional circumstances cannot and do not affect any permanent theory of interest or rent. The minimum rate of interest at any time is not *nil*, but the lowest rate at which people can be induced to save. So the basis of the theory of rent is not land which is worked at a loss, but the land which it is just worth while to cultivate. The same considerations must apply to industry and trade. The normal minimum of the reward of the employing class must be that which will just induce men to give their time and labour to the work of supervision and organisation. And this minimum is probably one of the most substantial shares of the product of industry. If a struggling employer has succeeded in carrying on an industry for his lifetime, and during that time has supported himself and probably brought up a family, it is preposterous to consider his earnings as nothing at all. What those earnings are to be called is another matter. Mr. Walker would decline to call them profits, because they are not earned by any exceptional ability. The employer who earns them belongs to the lowest normal class of employers, the people who conduct an industry so as to just pay them and no more. The truth is that the earnings of this class are wages, what J. S. Mill called "the wages

of superintendence." The primary difficulty of any theory of wages is the definition of the "labouring class." A man is none the less a labourer because he works with his head instead of with his hands. And a man is none the less a wage-earner because he pays his wages to himself instead of receiving them from another. The labour of supervision may be done by the master himself, or it may be done by a paid manager, who receives a salary, *i.e.* wages. The work is the same in both cases, and the reward is also the same. Thus the true conclusion seems to be that we must eliminate the temporary exceptions of production at a loss under conditions that cannot last. In the normal conduct of industry and trade all employers receive the wages of superintendence, and the more able receive an extra remuneration proportioned to their ability, which may be called profits or exceptional profits. The stage from which these profits must be reckoned, corresponding to the no-rent land, is the stage at which employers earn the bare wages of superintendence and nothing more.

If wages be taken in this extended sense, so as to include among the labouring class those who supervise industry as well as those who work with their hands, then Mr. Walker's theory may in the end be accepted, and it may be held that wages equal the residue of the product of industry, after deducting the rent of land, the interest on capital, and the profits of exceptional ability in direction. But this theory is of little practical use, as it leaves us face to face with the great problem of the present day, that this residue has to be further divided between employers and employed, between the class who pay their own wages and the class who receive their wages from others.

[F. A. Walker, *Pol. Ec.*, pt. iv., chs. iv. v. and vi., and *The Wages Question*, bk. ii.—Tauszig, *Wages and Capital* (1896).—Bonar, "Residual Theory of Distribution," *Harvard Quart. Journ.*, October 1891.] R. L.

**RESPONDENTIA BONDS.** This form of security, now disused through changed conditions and the immense capital employed, was one under which advances were made to the captain of a ship on the security of her cargo; respondentia bonds differed, therefore, from bottomry bonds, whereby the ship herself is pledged as security. (BOTTOMRY, LOAN ON.)

The contract of bottomry and respondentia seems to have deduced its origin from the custom of permitting the master of a ship when in a foreign port to hypothecate the ship in order to raise money to refit. Such permission is implied by the act constituting him master, not by common law but by marine law, for if the voyage is likely to be defeated for want of necessities, it is better that the master should have power to pledge the ship and goods rather than the ship be lost or the voyage defeated.

The period at which respondentia bonds first came into vogue is obscure equally with their distinguishing name, but the traders of the ancient world, to whom the contract of insurance was certainly unknown, were perfectly acquainted with the contract of bottomry and respondentia. There are evident traces of these species of contract in the fragments of the famous sea laws of the Rhodians, who used to borrow and lend on the hazard of the voyage for an increased premium. These laws speak of advances to the masters of ships who were proprietors of one-third of the lading, whether for the outward or for the homeward bound voyage, or both. Again, if the masters or merchants borrowed money for their voyages, the goods, freights, ships, and money being free, they could not make use of suretyship unless there were some apparent danger either of the sea or of pirates; and for the money so lent the borrowers had to pay naval interest. The Romans, who adopted the Rhodian laws, called respondentia *trajectitia pecunie*, probably because money was exported with the object of bringing back goods. If the ship were lost, the lender lost principal and interest.

In the middle of the 18th century, respondentia bonds appear to have been a form of security commonly taken by bankers and others to cover advances made on ventures to eastern ports beyond the Cape of Good Hope. As in the case of bottomry bonds, and in more remote times in the case of *FÆTUS NAUTICUM* (q.v.), the security of respondentia bonds became the medium of a species of marine insurance, and even degenerated into gambling, money being lent on the mere hazard of the voyage, on the condition that the loan should be repaid with extraordinary interest in case the voyage should be safely performed. To check this tendency it was provided (19 Geo. II. c. 37, § 55) that "all sums of money lent on bottomry or respondentia upon ships belonging to His Majesty's subjects, bound to or from the East Indies, shall be lent only on the ship or on the merchandise or effects on board, or to be taken on board, and shall be so expressed in the condition of the bond."

As the commerce of the country increased and insurance became more prevalent, it was found necessary to insert in the policy that the interest insured was bottomry or respondentia.

Lord Stowell, in the case of the *Gratitudine*, decided that the master of a vessel may in a foreign port hypothecate the cargo for repairing damages absolutely necessary. There is no restriction by the law of England as to the persons to whom money may be lent on bottomry or respondentia, neither is the amount restrained by any regulation whatever, except that on ships and goods going to the East Indies the money lent must not exceed the value of the property on which the loan is made.

Lord Mansfield held that by the custom of merchants, respondentia is insured under a special denomination, but Kent has also suggested that the risk is peculiar, as there is neither average nor salvage, and a capture does not mean a temporary taking only, but one that occasions a total loss. If it can be shown to be the usage in any particular trade to insure these interests under general words, they may be recovered under a policy containing such words only. On the ground of such being the custom in the East India trade, a captain was permitted to recover, at respondentia interest, money he had laid out for the use of the ship under the general words goods, specie, and effects on board.

The security given by the bond was on the goods and effects carried from England on board the ship, and on all other goods and effects acquired during the voyage.

The form of account endorsed on the bond was as follows. The Mr. Ebenezer Blackwell named was a member of the banking firm of Martins and Co.

#### ENDORSEMENTS.

Respondentia Bond. Jenkins to Blackwell. £3000 out and home at 32 per cent. Dated 30th November 1756. Due 30th July 1758.

1756					
Nov. 30.	To Money lent on Respondentia	£3000	0	0	
	To Respondentia on do. from 30th				
	Nov. 1756 to 30th Nov. 1759,				
	36 months at £48 p. month	1728	0	0	
		4728	0	0	
	To Interest on £4728 from 30th				
	Nov. 1759 to 22nd May 1760				
	the day the ship came to its

RESSI, ADEODATO. A professor at the university of Pavia at the beginning of the 19th century.

He wrote a treatise on economics in four volumes, entitled *Della economia della specie umana*; this treatise contains many vague and confused ideas, especially in the general principles on which the work is founded. While it is neither remarkable for the order of the matter—being full of frequent digressions—nor for sound logical argument, yet it deserves praise for the extent of learning shown, particularly in the part which deals with theory.

Ressi makes acute observations on the population question in reference to the theory of progression maintained by Malthus. He applies the doctrine concerning population to the problem of charity, maintaining that the growth of population must be checked by severe laws on charity; he would also limit the rate of marriage among the poor.

Examining the phenomena of value in a somewhat confused and indefinite manner, Ressi follows the ideas of Molinari Valeriani, basing value on the relation between demand and supply, but he does not thoroughly understand Valeriani's mathematical formula.

He puts forward sound ideas on international trade, limiting its importance to the general interests of the country, and advocating the widest possible freedom for trade.

Ressi makes correct reflections on small and large cultivation, recognising the application of the one and the other system to be dependent on the conditions of place and the nature of the products. He desires that the state should create industries to employ workmen thrown out of work through the use of machinery.

He has strong views on finance and the organisation of the taxes. He opposes the single tax, and in the taxation of land and manufactories he would exempt that quota which supplies the physical minimum necessary for life.

*Dell' economia della specie umana*, four volumes, Pavia, 1817-1820. (See Graziani, *Le idee economiche degli scrittori emiliani e romagnoli sino al 1848*, Modena, 1893; Idem, *Storia critica della teoria del valore in Italia*, Milan, 1889.) U. R.

REST, THE (BANK OF ENGLAND). The "rest" of the Bank of England is the name given for the difference between the assets and the liabilities—in other words, for the amount of the undivided profits held by the bank. It never, of recent years, is allowed to drop below £3,000,000, but immediately before the distribution of the dividends on bank-stock, in April and October, it sometimes mounts up to about £3,800,000.

The rest was first instituted in 1722, the year in which the Bank of England bought £200,000 South Sea annuities, two years after

the bursting of the South Sea Bubble (see BUBBLES; SOUTH SEA COMPANY). The rest has gone through various great fluctuations, the largest amount recorded being £8,639,680 (29th February 1816). Out of this surplus profit "an addition of 25 per cent was made to the capital stock of the proprietors" in the spring of 1816 (Tooke's *History of Prices*, vol. ii. p. 43). The rest did not long remain at this very high figure, which it attained during the suspension of specie payments, and it soon assumed proportions closely corresponding to those existing at the present time.

[Tooke and Newmarch, *History of Prices*, 6 vols. London, 1838-1857.—Francis, *History of the Bank of England*, 2 vols. London, 1847.—Marshall's *Digest*, London, 1833.—Turner, *Chronicles of the Bank of England*, 1897.]

RESTITUTIO IN INTEGRUM. Rescission of a legal act by the supreme authority of the pretor, where it has caused injury to the complainant, and there is valid ground, such as minority, fraud, or mistake, for reinstating a person in his original position. E. A. W.

RESTRAINT OF TRADE (Law of). In early days English law regarded all contracts in restraint of trade, that is to say, contracts by which a man bound himself not to carry on his trade or calling, as contrary to public policy, and therefore void. But about three centuries ago the rule became established that though a contract in general restraint of trade was bad, a contract in partial restraint might be valid. A man, for good consideration, might bind himself not to exercise his trade or calling to the prejudice of another within certain limits as to time and place. Of recent years the courts of equity have regarded the common law rule as a mere application of a more general principle, namely, that the restraint must be reasonable, having regard to the circumstances of the particular case, and not opposed to any obvious public interest. This principle has now received the sanction of the House of Lords, and will govern for the future. It was established in the case of *Maxim v. Nordenfjell*, A.C. (1894), 535, where a patentee and manufacturer of guns and ammunition for war purposes covenanted with a company to which his patents and business had been transferred, that he would not for twenty-five years engage in any similar business except on behalf of the company. This covenant was upheld as reasonable for the protection of the company. The history of covenants in restraint of trade is elaborately traced by Lord Bowen in the court below, L.R. 1 Ch. (1893), 651.

M. D. C.

RESTRAINT ON ANTICIPATION. It is a general principle of the law that a man cannot be deprived of the *ius disponendi* by a prohibition against alienation contained in the instrument under which he takes property. But in the case of married women such a

restraint can be imposed. After courts of equity had established the right of a married woman to hold separate estate, it was found that she might under the influence of her husband alienate the separate estate, and thereby defeat the object for which the estate was given. In order to prevent this, the courts of equity laid down the rule that a married woman might be prohibited from anticipation the income of her property, e.g. by sale or mortgage, so that she had power to deal with payments only as they actually became due. The restraint only attaches whilst marriage lasts, and therefore does not apply to a widow during her widowhood, but it will reattach on remarriage. By the Conveyancing Act 1881, a court may if it thinks fit, and if it appears to the court to be for the benefit of a married woman, make an order binding the separate estate notwithstanding that she is restrained from anticipating. J. E. C. M.

**RESTRICTIONS ON LABOUR.** What W. S. JEVONS calls "the evolutionist doctrine of freedom" has hardly a simpler or more effective illustration than the history of restrictions on labour. They were implied in the mediæval conception of unquestioned state control, and in the despotic theories of the new monarchy, and were discouraged simultaneously with the growth of philosophical ideas of liberty before and after the French revolution; while the movement for the abolition of political and religious disabilities in the early part of this century found its economic counterpart in the views of the MANCHESTER SCHOOL, whose advocacy of unrestricted *laissez faire* in the domain of industry was apparently strengthened by the proved advantages of *laissez passer* in the domain of commerce. In the struggle between state and society, as Von Plenier says, the modern industrial society won a rapid victory; but the abuses of the new order caused a reaction, in origin not economic but moral, which led to a reassertion by economists of the necessity of state control, based not on the old authority principle, but on considerations of general utility (see ADMINISTRATION). During the present century "two great discoveries have been made in the science of government: the one is the immense advantage of abolishing restrictions upon trade; the other is the absolute necessity of imposing restrictions upon labour" (Duke of Argyll, *Reign of Law*, London, 1867, 2d ed. 1884, ch. vii.). The LAISSEZ FAIRE school (q.v.) followed BASTIAT in confusing the art of legislation with the science of economics, and consequently misunderstanding both. The aim of legislation is not to secure the operation of scientific forces—which secures itself—but to provide the conditions under which those forces work for human good (Marshall, *Economics of Industry*, London, 1879, p. 3). On the one hand, the aspect of a situation

is seldom purely economic; on the other, the peculiar nature of economic science makes it impossible for economic interests to conflict with any other human interests (CAIRNES, *Essays in Political Economy*, London, 1873, essay vii.). The *laissez faire* view of restrictions on labour arose from a misconception of one element of economic existence—the human factor—in the very region where misconception was most fatal, since a man who sells his LABOUR (q.v.) sells his personality for the time being. The supporters of the first Factory Act urged philanthropic as against economic considerations, but in reality they were better economists than their opponents. Liberty in the *laissez faire* sense was not liberty at all. Economic liberty, as Levasseur remarks (*Les Corporations et la Liberté du Travail*, Paris, 1866), demands security, individual responsibility, the protection of those citizens who from the nature of the case are not free, and the sufficient education of all; and experience showed that all these conditions were violated when industrial competition was unrestrained by the state.

To repudiate the principle of unrestricted liberty is not to invoke that of paternal government. Since the individual may be trusted to follow his own interest, *laissez faire* is the legislator's best general rule; since all persons are not equally capable of doing so, restrictions become necessary in special cases for the protection of the weak. It is not always possible to wait for the operation of natural laws to relieve an evil, since economic forces once started on a wrong course work with merciless rapidity; but state intervention is not always advisable even where individual and public interests are undoubtedly opposed. The degradation of labour is hastened by mistaken or excessive as much as by defective legislation. Every restriction destroys some good while removing evil; and its full effects are not at once perceptible. Jevons, therefore, advocates experimental legislation in limited areas. Experience is the legislator's sole guide, and in estimating the value of a restriction, time, place, history, and natural characteristics must be considered. A regulation destructive of freedom in an advanced civilisation may be its safeguard in a ruder state of society: for instance, the advantages of free contract in England are no argument against forced apprenticeship in South Africa. Definite conclusions as to restrictions on labour are forbidden alike by the empirical character of the legislative art, and by the elastic and progressive nature of the economic science. Restraint must stop short of the point where it produces instead of protecting weakness. It must not handicap the weaker against the stronger, nor diminish that responsibility for the conduct of life which forms an important part of national education, nor interfere with the certain good of freedom in order to

prevent evils merely hypothetical. Class legislations, like the Statutes of Labourers of Edward III. and the Parish Settlements Act of Charles II., are false in principle, and disastrous if put into practice.

Restrictions may be imposed by the state, or voluntarily adopted. Direct restrictions were made necessary in the interest of the labouring class by the abuses of the large industrial establishments which arose on the introduction of machinery. FACTORY ACTS (*q.v.*) were, however, in no sense class legislation; and, in fact, protect the better sort of employer against the competition of more unscrupulous rivals. Interference with individual liberty, or, as regards children, with the *patria potestas*, was in this case justified on both scientific and practical grounds. Danger from the competition of unrestricted foreign industries was urged against the acts; but, apart from the fact that factory legislation in England was gradually followed by similar, and, in some cases, more complete legislation abroad, the ultimate results of reform were not disadvantageous to the employers (see Von Plenier, *English Factory Legislation*, English translation, London, 1873, p. 92; Tooke, *History of Prices*, London, 1857, vol. vi., appendix viii. p. 519). Of the various kinds of restrictions, (1) limitations on the labour hours of children and young persons, for reasons of health, and, in the former case, of education, are now recognised as necessary both by economists and legislators (see CHILDREN'S LABOUR). (2) Similar restrictions in the case of men cannot be discouraged on the principle of liberty, since an individual workman in a large industrial establishment is often not entirely a free agent; and the state has already conceded the principle of protective legislation for men, in the laws forbidding TRUCK payments and enforcing the fencing of machinery. FAWCETT opposed the nine hours bill as encouraging the growing tendency of workmen to rely on state intervention (*Speeches on some Current Political Questions*, London, 1873). ROSCHER thinks limitation of hours advisable only where the labouring class is not in a condition to defend itself by combination; he points out that, in any case, the "normal day" would require to be of different length in different trades. (3) As to the labour of women, opinions differ. The legislature recognises a distinction in restricting their labour hours and in forbidding their work in mines and collieries. Some economists, like J. S. MILL (*Principles of Political Economy*, popular edition, London, 1880, p. 579) and Fawcett (*loc. cit.*), protest against restrictions based on sex; others, not contradicting them in principle, advise restrictions on the ground of expediency. Roscher remarks that the question must be decided according to each case: it would be unfair if regulations, due possibly to jealousy, should deprive a widow,

for instance, of the means of bringing up her children. Jevons advocates further restrictions in the case of married women, but admits the difficulty of legislative interference at present (see FEMALE LABOUR). Two species of industry demand particular notice. (4) The labour of shop assistants was until lately left free from restriction, as belonging to the sphere of trade; but the distinction is often purely artificial. Jevons, writing before the Shop Hours Acts, showed that for effective reform in this respect state intervention was necessary, and practicable. In view of possible disadvantage to the public, especially the working-class public, he suggested experimental legislation. (5) In agricultural labour legislation has been found necessary to break up the system of public gangs, and to secure the education of children. (see GANGS, AGRICULTURAL; GOVERNMENT REGULATION OF INDUSTRY).

Restrictions which begin with being voluntary become occasionally in course of time sanctioned, enforced, or prohibited by the state. Their character is necessarily greatly modified under these circumstances. The influence of the state is traceable in all three directions with regard to the most ancient and important of them, the GILD or TRADE UNION. So long as the state refrains from protective restrictions on the ground that men can make their own terms, it cannot justly refuse to labourers the right of combination which is often their only means of doing so (M'Culloch, *Treatise on the Rate of Wages*, London, 1868, ch. vii.); further, since common trade interest is one of the strongest of social bonds, prohibition usually results in the transformation of a trade union into an industrial conspiracy. On the other hand, to enforce the trade union on the public, as was the object of the English Statute of Apprentices in 1562, is to establish a monopoly with its attendant evils. The remarks of SAY (*Cours Complet d'Écon. Pol.*, Paris, 1852, pt. iv. ch. viii. ix. x.) and of SMITH (*Wealth of Nations*, bk. i. ch. x. pt. ii.) apply to the gild in its later, not in its earlier or free form. The objects of trade union restrictions are various. Attempts to limit the number of workmen in a trade, as checking the mobility of labour, are condemned by Howell (*Conflicts of Capital and Labour*, London, 1890, ch. v.), who, however, shows that in general there is little practical difficulty in entering a trade union. Regulations with a view to securing efficient workmanship existed in the gilds, as in the modern incorporated professions; here the trade unions have as yet shown little activity. In legislation on the methods of industry the efforts of trade unions, like those of governments, have usually been misdirected (Walker, *Wages Question*, p. 406); Howell thinks they have been slandered in this respect. The objections formerly urged against STRIKES

were based on the exploded doctrine of the WAGES FUND (*q.v.*). Economists now regard them as inevitable in the present position of employer and labourer; the state neither forbids nor protects this species of contract. The survival of APPRENTICESHIP (*q.v.*) in England is due chiefly to the trade union; the state no longer imposes any restrictions as to number, nor, except in the case of the medical and legal professions, as to time. SMITH (*loc. cit.*) advised the abolition of apprenticeship as producing neither industry nor efficiency. Jevons follows him, and would have restrictions placed on the power which, under the common law, parents still possess of binding their children as apprentices. Roscher, after describing the evils of the German system, suggests as remedies written contracts, trial periods, and the extension of the examination system. Like CARLYLE (*Past and Present*, London, 1872, bk. iv. ch. v.), he maintains the moral and economic necessity of permanent contracts between workman and employer, but doubts whether anything is to be gained by state regulation. He advises a system of *Arbeitsbücher* as likely to promote the desired condition of mutual appreciation and comprehension.

[See Roscher, *System der Volkswirtschaft*, Stuttgart, 1880-81, vol. iii. §§ 147-154.—Jevons, *The State in Relation to Labour*, London, 1882; and Walker, *The Wages Question*, London, 1891, *passim*. Levasseur's essay, quoted above, is part of Thévenin's *Cours d'Econ. Industrielle*. The historical aspect of restrictions is well given by Brentano, *The Relation of Labour to the Law of To-Day*, English translation, London and New York, 1891. On labour legislation see Howell, *Handy Book of the Labour Laws*, London, 1895.—Horner, *On the Employment of Children in Factories*, London, 1840.—Senior, *Letters on the Factory Act*, London, 1837.—Marx, *Capital*, English translation, London, 1887, ch. xv.-xvii. On guilds and trade unions see Brentano, preliminary essay in Toulmin, *English Guilds*, London, 1870.—Fawcett, *The Economic Position of the British Labourer*, Cambridge and London, 1865; and *Manual of Political Economy*, Cambridge and London, 1865, bk. ii. ch. ix., illustrates the wages fund theory. See also Thornton, *On Labour*, London, 1869, bk. iii. ch. iii., iv.]

E. R. F.

#### RESTRICTIONS ON TRADE. See TRADE.

RESUMPTION (IN U.S.A.) (the \$ in this paper converted as 5=£1) refers to the resumption of specie payments or redeemability of the legal tender notes, commonly known as greenbacks, by the United States government on 1st January 1879. These notes were issued by act of congress, dated 25th February 1862, to the amount of \$150,000,000, (£30,000,000). On 11th July 1862 a second issue was authorised to the same amount, and on 3rd March 1863 a third issue, making \$450,000,000 in all (£90,000,000). These

notes were at first fundable into government bonds, but in July 1863 that privilege was withdrawn. The notes depreciated; in 1862 they were worth only 86 cents, in 1863 only 76 cents, and at one time in 1864 they sank as low as 38 cents. Before the end of the war, congress became alarmed at the depreciation, and on 30th June 1864 passed a resolution that "the total amount of United States notes issued or to be issued should not exceed \$400,000,000 (£80,000,000), and such sum not exceeding \$50,000,000 (£10,000,000), as may be temporarily required for redemption of temporary loans." On the conclusion of the war, Secretary of the Treasury McCulloch, in his report (4th December 1865), recommended "the steady and persistent retirement of the legal-tender notes until we should get back to specie basis," and in his report for 1866 the secretary expressed the opinion "that specie payments may be resumed and ought to be resumed as early as the first day of July 1868." Congress did indeed authorise the secretary (12th March 1866) to exchange notes for bonds, but not more than \$10,000,000 (£2,000,000) a month for the first six months and thereafter not more than \$4,000,000 (£800,000) in any one month. But the retirement of these notes was counterbalanced by the issue of national bank notes, and the premium on specie remained about the same. Owing to the outcry about "contraction" of the currency, congress in January 1868 stopped further redemption. At that time there were about \$356,000,000 (£71,200,000) of the notes outstanding. The next secretary (Boutwell) agreed with congress that the true policy was to wait for the country to "grow up" to the present volume of currency, believing that then the premium on gold would disappear, and specie payments might be resumed (Report, 1872, p. xxii.). The maximum fixed by law remained at \$400,000,000 (£80,000,000), although the amount actually outstanding was only \$356,000,000 (£71,200,000) or less. During the panic of 1873 the amount was increased to \$382,979,815 (£76,595,963) by Secretary Richardson, who bought bonds in order to relieve the money market. An act of 20th June 1874 provided that "the amount of United States notes outstanding and to be used as part of the circulating medium shall not exceed the sum of \$382,000,000 (£76,400,000), which said sum shall appear in each monthly statement of the public debt, and no part thereof shall be held or used as a reserve."

Finally an act of 14th January 1875, known as the Resumption Act, required the secretary of the treasury, on and after 1st January 1879, to redeem in coin the legal-tender notes on their presentation at the office of the assistant treasurer in the city of New York, in sums of not less than \$50 (£10). To accomplish

this, the same act authorised an increase of the circulation of national banks, but required the secretary of the treasury to retire legal-tender notes, to an amount equal to 80 per cent of the national bank notes thereafter issued, until the amount of such legal-tender notes outstanding should be \$300,000,000 (£60,000,000) and no more. This portion of the act was repealed in 1878, but the amount of notes outstanding had been reduced to \$346,681,016 (£69,336,203) at which sum it has since remained. Still further, the secretary was authorised "to use any surplus revenue from time to time in the treasury not otherwise appropriated, and to issue, sell, and dispose of, at not less than par in coin, any of the 5, 4½, and 4 per cent bonds authorised by the act of 1870." The secretary sold bonds and accumulated a reserve of \$135,000,000 (£27,000,000) of gold coin and bullion, or about 40 per cent of the outstanding notes. The banks of the country aided the government, holding at the date of resumption more than one-third of the outstanding notes, but none were presented by them for redemption. The people had confidence in the government and preferred the paper money. There was, therefore, no demand for payment of the notes, and the gold reserve increased more than \$36,000,000 (£7,200,000) in the ten months succeeding resumption. The act of 1875 is continuous in its operation, and has since been made use of to replenish the gold reserve depleted by the panic of 1893 and the fear of free coinage of silver.

[Reports of Sec. of Treasury. John Jay Knox, United States Notes, N.Y., 1884.] R. M. S.

#### RESUMPTION OF SPECIE PAYMENTS IN THE UNITED KINGDOM. See SUSPENSION OF SPECIE PAYMENTS.

**RETAIL AND WHOLESALE.** *Retail* derivatively means to cut up again (Fr. *retailer*, comp. *et gros et en détail*). It is generally used now in opposition to *wholesale* to express the act of selling commodities in small quantity, especially at shops or stalls. Originally the term meant something more than this, it conveyed the meaning that the phrase "retailing a story" does still; namely providing it at *second-hand*; but this implication seems practically obsolete at present, except in the above connection. A retail trader is consequently a purveyor of goods on a small scale, nothing more. The significance of *wholesale* is wider. It means dealing in the gross, or on a large scale, both as to buying and selling; in which former respect therefore it differs from the complementary term.

The Factory Act of 1883 (46 & 47 Vict. c. 53) contains a legal definition of retail in connection with the special occupation of *baking*. Section 18 enacts—"The expression 'retail bakehouse' means any bakehouse or place, the bread, biscuits, or confectionery baked in which

are not sold wholesale, but by retail in some shop or place occupied together with such bakehouse, which is not a factory within the meaning of the act of 1878." This appears to be the only statutory definition of either term.

R. W. C. T.

**RETALIATION.** The idea of retaliation assumes that, in Bismarck's words, "Trade between nations is to the advantage of one party over another" (*Speech*, 2nd May 1879), and therefore one nation benefits its own by hurting another nation's trade. When Europe formed itself into nations this idea was almost universal. Bacon's "*Quidquid alicubi adjicitur alibi detrahitur*," Montaigne's "*Le profuit de l'un est le dommage de l'autre*," De Launay's "*Quand on agit contre l'étranger on agit pour la nation*," were maxims to which the most enlightened writers (like GROTIUS) only discovered exceptions; until TUCKER (1747), HUME (1752), QUESNAY (1756), and JUSTI (1759), and finally A. SMITH (1776), reversed their maxims, so that the only question which modern economists ask is: are retaliatory tariffs compatible with the undoubted truth that trade is mutual gain? Most nations answer this question in the affirmative, and the Swiss referendum (18th Oct. 1891) sanctioned the worst retaliatory tariff. Since 1860 France has had a double tariff on imports, and the maximum, which, since 1892, has been used for no other purpose than as a threat to extort concessions for French exports, is usually 41 per cent higher than the minimum; nor will she, since 1892, bind herself to the minimum tariff for more than a year. Germany in 1879 conferred on the executive, subject to confirmation by the legislative, power to add 50 per cent to tariffs on imports, and this was increased to 100 per cent in 1895. An act of 1828 authorised the U.S. executive to remit discriminating duties on proof of "reciprocal exemptions"; and the McKinley tariff (U.S.A., 1890) enabled the executive to impose duties on the then free breakfast-table, a provision borrowed by the Dingley tariff (1897), and copied by Germany in 1895. Every nation—except England—arms itself in one or all of these ways, and uses its arms if its exports are subjected to disadvantages. Lord Salisbury has often (*Times*, 12th Oct. 1881; 11th March 1897) expressed a wish that he might wield these weapons with regard to luxuries, even although their use would prove protective. Colonel TORRENS held similar views some sixty years ago. No one will deny nowadays that in sur-taxing imports we dwarf or destroy not only that trade, but also the export trade which buys the imports, unless the consumer or producer submit to be sur-taxed; that is to say, in any case retaliation must be double-edged. The only questions are: (1) Which edge is sharpest? Can we injure others

more than ourselves? (2) Is it worth while to maim ourselves temporarily in order to secure lasting health?

(1) RICARDO said, "every restriction which we put upon the production of our neighbours reacts with a *double* force upon our own" (Hansard, vol. lxviii. p. 902); and Fawcett wrote as though a tax on the consumer were the "inevitable" effect of an import duty (p. 57); but as Sidgwick and Nicholson point out, there may be cases where the producer reaps economic "rent," and cannot do better than sacrifice his "rent" in order to keep the old customer. But in the absence of concrete instances it would be folly to act on the supposition that these cases exist. Again, as £100 means more to the poor than £200 to the rich, so doubtless the old policy of England towards Ireland hurt the latter most. But it is not against poor countries that this weapon is asked for. As for rich countries, Fawcett and Farrer have proved that we are net exporters of manufactures to the United States and Germany, so that in case we might be tempted to retaliate by sur-taxing their manufactures, our exports would be likely to suffer most; and in any case our customs' arrangements would have to be more complicated and expensive if we treated each country differently; and retaliation would generally involve protection unless supplemented by an excise-tax, for which we have not got the machinery. Finally, when the state deprives a trader of his customers, that is the same thing as confiscating his good-will; and trade cannot thrive where confiscations often occur.

(2) Retaliation is by no means an invariable prelude to peace. The commercial treaties which make for free-trade, namely the Anglo-French of 1860, and Caprivi's treaties with Austria - Hungary, Italy, Switzerland, and Belgium (1891-1903), were concluded without retaliatory threats or acts. It is true that the Russo - German, Franco - Swiss, Spanish - German commercial wars of 1893 *et seq.* led to treaties in 1894, 1895, and 1896 respectively, but at what a cost: Germany, France, and Spain hit as hard as their laws allowed them; and Switzerland laid 190 per cent duties on to imports from France, thereby creating temporarily protected industries which it does not like to destroy; indeed, it would seem that a strong reaction towards protection is the necessary result of a war of tariffs carried on on this scale. Further, the United States and Canada have fought since 1865 without being nearer peace. Retaliation is clearly a curse which comes home to roost; the indirect blessings it proposes are sometimes never secured at all, or if secured entail too great sacrifices. The diplomatic argument in its favour belongs, as A. Smith wrote, "not to the science of a legislator," but "to the skill

of that insidious and crafty animal *vulgarly* called a statesman or politician." It is as dust when weighed in the balance against, for instance, the argument against protection.

RETENUE. In old French financial language, the stoppage of the payment of a part of a salary, pension, or annuity, due by the state. In times of distress, such *retenues* were a favourite expedient of the French governments before the revolution of 1789. In modern times, it is also applied to the legal percentage kept back on the salary of officials towards a pension, when they leave the public service, either by superannuation or any other lawful cause.

E. Ca.

RETIRE A BILL. To withdraw from circulation before maturity.

REVENUE, PUBLIC. See FINANCES, PUBLIC.

REVIVAL, TRADE. "Revival of trade" is a phrase much employed colloquially in market reports and newspaper comments on the condition of industry and commerce. It has a correlative term, namely, depression of trade, and both expressions are frequently employed without much thought as to their meaning. In any case both phrases require explanation when used, for though it is quite true that, as a general rule, the majority of trades "revive" or become "depressed" together, it often happens that some one more or less important trade is an exception owing to a special cause. The term hardly admits of accurate and scientific definition, but certain signs which accompany revival of trade may be mentioned. Among these are increasing clearing-house returns, increasing railway and telegraph receipts, more activity in the markets for wholesale commodities, expansion of the leading branches of the imperial revenue, especially customs, excise, and stamps. Income tax is not so good a measure of trade revival as might be supposed, for it does not respond promptly to the movement, because increased revenues do not as a rule accrue to those engaged in industry until the trade expansion has been going on for some little time, a fact which was recognised

by the provision of the law allowing business men to take the average of the preceding three years as the basis for their assessment to income tax—rescinded by Mr. Asquith when Chancellor of the Exchequer in his budget arrangements, 1907. In like manner the income tax receipts often continue to come in well some time after trade has begun to grow slack, that is, when the volume of commercial transactions has begun to decrease. No one of these statistical statements alone can be regarded as affording a sign of expansion or contraction in trade, but when several of them are present at once they supply a strong presumption that a movement is taking place.

Very often when a "revival" or "depression" of trade is discussed in the newspapers the writer is thinking too much of some specific trade whose condition at that time has been thrust on his attention, sometimes by accident, sometimes by persons who are interested for the moment in creating an impression that the situation is hopeful or unpromising in their department. Most business men, when they talk of trade being "bad," mean their own trade.

REVOLUTION, FRENCH (ECONOMIC ASPECTS OF). The French revolution—the most typical revolution of modern Europe—involved a number of economic experiments, which we may conveniently classify into (1) destructive; (2) confiscatory; (3) reconstructive; (4) monetary. Under the head of (1) it is necessary to indicate some of the social conditions of France before the August of 1789. We shall then realise how completely the work of the following months transformed a mediæval into a modern industrial system.

1. Among the economic aspects of 18th-century France we may notice (a) a half-decayed feudal system; (b) a newly-established centralised autocracy, with a somewhat elaborate organisation of industry, built up chiefly by Colbert within a century, but already falling to pieces.

(a) In theory feudalism was based on reciprocal services. Privileges were granted to nobles and clergy in return for services rendered. But by the 18th century the privileges alone remained, whilst the services had ceased to be rendered. The nobles were no longer the administrators of districts. They were, for the most part, courtiers living on their privileges, and rendering no services to the community. Clerical privileges had similarly become mere abuses. Immense endowments were enjoyed by dignitaries who practically discharged no useful functions.

(b) The centralised organisation of industry had been partly the result of political circumstances, of the wars with England, and the need of national unity. But the royal power,

thus built up, had tried to direct industry into channels that should be advantageous to the king, and to the classes that possessed political influence. The economic results were (a) an exceptionally unequal distribution of wealth, partly due to the exemptions from taxation enjoyed by the privileged classes, partly to the opportunities enjoyed by the latter for extorting wealth and unpaid labour from the poor; (β) a general depression of trade and manufactures, due partly to barriers that hindered the free passage of goods and labour from one district to another, partly to monopolies enjoyed by corporations, partly to, often well-meant, regulations as to how various industries were to be conducted, and even as to the prices at which certain commodities, especially bread, were to be sold. The burden of a heavy taxation to defray the expenses of long wars, and support the extravagance of the government, was aggravated by the absurd and unequal ways in which it was levied. The economic movement, which we associate with Adam Smith, involved an indictment of the whole industrial system in France, and more especially of the restraints on trade. The famous phrase, *laissez-faire*, meant originally, "Let men make what they please, how they please"; and *laissez-aller* meant, "Let them move from place to place according to the demand for their labour or their commodities, without the hindrances of barriers and internal customs, of the restrictions of the feudal system, and rules laid down by a paternal government."

The economists practically triumphed on 4th August 1789, the St. Bartholomew of abuses. For among the abuses swept away by the national assembly, restrictions on trade and feudal obligations were prominent. That these restrictions and privileges were injurious is pretty generally admitted. It may be questioned, however, whether their gradual removal would not have been more expedient. So sudden a change was the cause of a vast dislocation of industry, and the industrial condition of France, though rendered less irrational, was little, if at all, improved. Moreover, with the abuses, many institutions were swept away which contained potentialities of useful development. Thus the schools were broken up, and 200,000 children dispersed. Many corporations, such as almshouses and hospitals, were demolished, because the revolutionists were too impatient to attempt their reformation. With the destruction of the old provinces, local patriotism was also to some extent destroyed.

2. This brings us to the *confiscatory* measures of the revolution, of which we may say, generally speaking, that, however necessary or justifiable some of them may have been, they tended to aggravate disorder, to drive capital abroad, and to discourage industrial enterprise.

These confiscatory measures may be divided into (a) those dealing with the church; (b) those directed against emigrants and other enemies of the revolution; (c) those directed against the rich, simply because they were rich; and (d) those prompted by the necessities of the government, or the need of pacifying hungry mobs.

Many of the confiscatory measures fall, however, under several of these heads. Thus the partial disendowment of the church (1789-1790) was due partly to hostility towards the clergy, partly to a desire to diminish the inequalities in clerical incomes, partly to the urgent need of money to choke the deficit.

The issues of inconvertible paper were mainly prompted by financial needs, but the special form of the issues (the *ASSIGNAT*) must be connected with the desire to increase the number of small proprietors, and this again grew partly out of the passion for equality, and partly from the desire to build up a strong class directly interested in the maintenance of the revolutionary settlement.

The heavy taxation of the rich must similarly be connected partly with the passion for equality, partly with the attitude of the propertied classes to the revolution, and partly with financial exigencies. The question how far such special taxation may justifiably be carried is one of the most difficult in economics, but it is certain that the National Convention carried the principle far beyond the bounds of expediency or justice. In so doing much injury was inflicted, even on the poor. The demand for the skill of those whose occupation had been to minister to the comforts and luxuries of the rich was almost annihilated. Many skilled labourers sank to the ranks of the unskilled; others became beggars and thieves.

3. The attempts of the dominant revolutionists to reconstruct the social system were very varied and complicated. Originally the revolutionary party included individualists like Count MIRABEAU, and socialists like Robespierre; and though the former were soon swept aside, the policy of the government varied continually according to the degree of socialism professed by its members.

(a) One of the most important and disastrous of the economic experiments of the convention was the attempt to fix a *maximum* beyond which the prices of the necessities of life might not go. Irregular and partial efforts in this direction had been made even before the revolutionary days, as when the government subsidised the Paris bakers in times of dearth. In 1790 we find local authorities, and sometimes mere mobs of rioters, insisting on a maximum for bread, and sometimes also for meat and other commodities. In 1793, owing to the extensive issues of *assignats*, and to the diminished pro-

duction consequent upon the interruptions of industry and the general disorder, prices rose with alarming rapidity. In April and May the convention passed decrees establishing a maximum for grain. At a later time the principle was extended to meat, fuel, clothing, vegetables, tobacco, beer, and other articles, including even many kinds of raw materials. Stringent measures were adopted in order to enforce the law, and to prevent evasions by private sales, or by accumulating supplies. But these attempts had only a partial success, though a law was actually passed to punish with death all who possessed supplies of these commodities, and would not offer them for public sale at the legal price. In spite, however, of all evasions, the law brought agriculture, manufactures, and commerce almost to a standstill. Farmers and peasants soon produced little more than sufficed for their own private consumption. Hardly anything was produced for purposes of sale. Many crops remained unharvested; factories were closed; fishermen refused to go to sea. People would not work if they saw no chance of getting remunerative prices for their produce. Many people were imprisoned for the crime of refusing to pursue trades in which they were not allowed to make profits, or of selling at prices which purchasers were glad to pay, but which were often 200 per cent above the legal maximum. Frightful distress followed, especially in cities and unfruitful regions, where people could not produce sufficient food supplies for their own support. Many were crushed to death in the scramble at the bakers' shops; many, especially of the children, were literally starved. After the fall of Robespierre (July 1794) the law was openly broken. Fortunately it had neglected to take cognisance of *live* cattle and sheep, and consequently, though there was a dearth of bread, meat became tolerably plentiful, when it could be sold at a fair price. Agriculture and manufactures began to revive, especially after the maximum law had been formally repealed (December 1794).

(b) Another attempt of the socialistic revolutionists was to secure employment for all who wished to work. Here again the revolution was in some respects only following the example of the *ancien régime*, under which unremunerative work had often been started for the benefit of the indigent of Paris. The revolution, however, carried this principle much farther. As early as 1789 there were 12,000 men in Paris employed on useless levelling, at a payment of 9d. a day. In 1793 the "right to labour" was formally affirmed by the convention, but no general attempt was made to secure it; though in Paris, and some other places, employment was artificially created. Some temporary relief was thus given, but the ultimate effect was to aggravate the general misery.

(c) Of the effects of the revolution on the distribution of land, we may speak very briefly. It is a complete delusion to suppose that the revolution either created or even extended the system of PEASANT PROPRIETORS in France. In 1815, as in 1788, about 14,000,000 hectares, or somewhat less than one-third of the agricultural land of France, was owned by small proprietors. Nor did the revolution produce or encourage the excessive subdivision of land on the system of small farming. Arthur Young asserts that he saw many properties of 10 roods; and Turgot complained, long before the revolution, that farms only just capable of supporting one family were divided up, at the owner's death, among five or six children. The part the revolution played in this matter was as follows. (a) It practically called into existence a class of medium-sized properties, such as were scarcely known in most parts of France under the *ancien régime*. The confiscated lands of the *émigrés*, of the suspects, of the church, and other corporations, were almost entirely purchased by the *bourgeois* class. The peasants were, in most cases, far too poor to buy even the smallest plots of land. But, in 1831, 700,000 moderate-sized properties existed, averaging 140 hectares each. In this, as in many other respects, it was the middle classes, rather than the poor, who gained by the revolution. (β) The revolution promoted an improved system of tillage by abolishing feudal and ecclesiastical dues, forced labour, inland duties, and many other obsolete or oppressive institutions. Quesnay calculated that, in 1750, one-fourth of the arable land of France lay uncultivated. This was largely due to want of capital. Arthur Young estimates the average capital per acre on French farms to have been only one-sixth of what it was in England at the same time. To this want of capital we may add want of knowledge, and, above all, the absence of motive for industry. The *métayer* (see *MÉTAYAGE*) in particular, knew that half of any increase in produce would go at once to the landlord, and that the rest would probably be taken from him, legally or illegally, by tax-gatherer or noble. The small proprietor and the *métayer* alike were released by the reforms that began on 4th August 1789, from burdens that made their positions almost intolerable, and deprived them of almost all motive for energy. Accordingly, though the revolution did not increase the amount of land owned by the peasantry, it did considerably improve the lot of those who survived the terrible sufferings of the days of the Terror and the reaction.

(d) It is scarcely necessary to speak of the attempts made under Robespierre to carry out Rousseau's idea that digging the earth is conducive to virtue. A certain number of pleasure-grounds were converted into potato-fields; but

the declared policy of the triumvirate, to cut up France into a number of small estates, was never practically attempted.

On the same principle, we need not dwell on the various attempts made by the revolutionists to extend the agency of the state into the field of industry. These were mostly of so crude a sort that their failure throws scarcely any light on the very important question as to the limits of expedient state interference with free enterprise, or state management of industrial operations. Some of these attempts may have been justified by the critical position of France, or by the miseries of a transition period, especially when that transition is brought about by violence.

4. The currency experiments of the French revolution provide the most striking historical illustration of the injury that may be done to a community by excessive issues of inconvertible paper money (see *ASSIGNAT*). The first issue of 1790 produced no great evils. In fact, a very good case may be made out in its defence. The government had confiscated the church lands, and were anxious to convert them into small properties. But if these vast territories had been thrown on the markets at a time of general poverty and depression, the prices realised would have been utterly inadequate. Yet in the financial straits to which they had been reduced, partly by the misgovernment and extravagance of the old régime, partly by the early disorders of the revolution, the government could not afford to wait. Moreover, they had every reason to desire to interest the middle classes in the maintenance of the new system, and this could not have been done more effectively than by multiplying the proprietors of confiscated lands; for these would fear the reabsorption of their properties if the reactionaries triumphed. Accordingly 400,000,000 francs were issued in assignats, which the state undertook to accept at full value in the sale of lands, but which were not to be otherwise convertible. This inflation of the currency led, of course, to some rise in prices; but the assignats were not, at first, seriously depreciated. The transaction was in effect a mortgaging of state lands, and there appeared at that time to be force in Mirabeau's argument, that the paper money could not be greatly depreciated so long as its nominal amount remained far below the value of the land which was the holder's security.

The second issue of 1790 might be similarly defended, especially as it was accompanied by a pledge that the total issue should never exceed 1,200,000,000 of francs. It was, however, at least questionable whether the lands regarded as security could, in existing circumstances, be valued as highly as this; and prudent persons might well doubt whether the pledge would be kept. Accordingly, the second issue was only carried by a majority of eighty-five

votes, in spite of the ever-growing financial stress, and the political advantages of the policy from the revolutionary point of view. Nevertheless, the consequences though evil were not disastrous till, in the year 1791, when the national pledge was broken, and the promised limit exceeded by 600,000,000 francs. From this time the French currency became hopelessly disorganised. The precious metals disappeared under the natural operation of GRESHAM'S LAW. Bank notes had to be issued even to supply small change for petty transactions, and prices began to rise with fearful rapidity. By August 1793 there was a premium of 400 per cent on the precious metals. The rise in general prices was at least as high, and the government found itself almost compelled to issue more and more paper to defray its expenses, at the increased prices. The fall of Robespierre, and the triumph of the reaction, did not improve matters in this respect. There were still further issues, and by the beginning of 1796 there was paper in circulation to the nominal value of 3,600,000 millions of francs. The depreciation was now scarcely to be estimated. Industry was almost at a standstill. People produced for consumption, but hardly for exchange, and where exchange was necessary they preferred to resort to barter. It is probable that no branch of the revolutionary policy produced anything like the same amount of misery as the debased currency.

It is difficult to exaggerate the distress that existed in France at the close of the reign of terror, and in the following year (1795). It was almost certainly worse than that which existed under the *ancien régime*. Nevertheless, it can scarcely be doubted that France gained greatly in the long run by the revolution, in the two respects with which economics are chiefly concerned. The production of wealth increased greatly after the revolutionary wars, and the distribution of the product certainly became less unequal. Socialist writers are fond of arguing that it was only the *bourgeois* classes and the peasant proprietors who gained by the revolution. But even if this be admitted, it must also be remembered that these classes formed a very large portion of the nation; and in reality the artisan class undoubtedly shared in the improved industrial condition of France. The economic advantages gained do not, of course, justify the crimes by which the revolution was stained. It is, however, beyond the scope of the present article to pass judgment on these, or to consider the attempts that have been made to excuse or palliate them. Neither can we consider here whether the good might not have been obtained without the evil, or, in other words, whether the institutions of ancient France had sufficient vitality in them to admit of a peaceful development into accord with modern social and

industrial conditions, or whether, on the contrary, they were only fit to be cut down and cast into the fire.

J. E. S.

REYBAUD, MARIE ROCH LOUIS (1799-1879), born at Marseilles, died at Paris. During his whole life long he wrote, either as an economist, a journalist, or a novelist. He was elected a deputy in 1846, a representative in 1848—both to the constituent and the legislative assemblies, and in 1850 a member of the *Institut* (*Académie des Sciences morales et politiques*). Throughout he retained his individuality unchanged, he belonged to no group, to no party. His deafness isolated him from the crowd, but not from a few chosen friends. As a writer his position was far different; he was popular, and commanded thousands of readers.

To the masses he is the author of *Jérôme Paturot à la recherche d'une position sociale* (1843), an amusing, witty, but somewhat sceptical and cross-grained criticism of the literary schools of the first half of the 19th century; at another time, *À la recherche de la meilleure des républiques* (1848); he criticised often in rather a forced way the political world as it existed after February 1848—that is to say—everybody, since universal suffrage then ruled. To thoughtful minds, those who prefer moral and economic subjects, he is the author of *Études sur les réformateurs contemporains ou socialistes modernes* (1st ed. 1 vol. 8vo, 1840; 4th ed. 2 vols. 8vo, 1843; 7th and last edition, 2 vols. 8vo, 1864), which appeared in 1836 and 1838 in the *Revue des deux mondes*, and won him, 1841, the great Montyon prize. Other works recommend him no less directly to scientific thinkers, *Les économistes modernes*, Rich. Cobden, Fréd. Bastiat, Mich. Chevalier, J. Stuart Mill, Léon Faucher, and P. Rossi (8vo, 1862), also first printed in the *Revue des deux mondes*; then the *Études sur le régime des manufactures*, in 4 vols. 8vo (vol. i. 1859, *Silk*; ii. 1863, *Cotton*; iii. 1867, *Wool*; iv. 1874, *Iron and Coal*). Finally, in 1849, he made a most valuable report for the government on Algeria. All these works show an observant mind and an independent character. They are written with intelligence, spirit, and good sense. Reybaud was never moved by the opinions of the day. A warm republican during the monarchy, he was a doubtful partizan, even thought reactionary under the republic. Throughout honest and disinterested, there is no stain on his memory.

A. C. F.

RICARDO, DAVID (1772-1823), of Jewish origin; his father, born in Holland, was engaged on the stock exchange, London, from the age of fourteen, and, after acquiring a large fortune with the universal esteem and respect of his competitors, began to retire in 1814, when he became a landowner in Gloucestershire, and, though never in Ireland, M.P. for Portarlington (1814-23). A. Smith's *Wealth of Nations*, which he read in 1799, was his only literary education; and his business, of which he said "competition was nowhere carried to such an extent and nowhere operated with more benefit"

(Hansard, xl. 356), exactly realised A. Smith's postulates. The identification of theory with such practice as lay within the scope of his experience is the secret of his character and influence; and he was the first English thinker who brought abstract arguments to bear on questions of the hour and produced immediate political effects such as the report of the BULLION COMMITTEE, and the resumption of cash payments. Indeed this "father of the deductive method," as he has been called, possessed a more vivid insight into certain industrial facts than many economists before or since. His *Political Economy*, "which would never have been published but for the entreaty of my father" (J. S. Mill, *Autobiography*, p. 27), grew out of his private *Letters to Malthus* (1810-23, ed. J. Bonar, 1887) and *M'Culloch* (1816-23, ed. Hollander, 1895), and out of conversations with J. Mill (1811-23), with whom he walked "almost daily" (Bonar, p. 150), Malthus, and (in 1823) M'Culloch. J. Mill said that he and M'Culloch were the only disciples of Ricardo; but Bentham called J. Mill his spiritual son, and Ricardo J. Mill's spiritual son. The solution of this contradiction seems to be that in economics Ricardo's was the master mind, that Bentham's political atomism influenced Ricardo's general views, and that in practical politics their aims happened to coincide. In arguing for a poor law which should aim at its own extinction, in examining the schemes of R. OWEN (1819) (*R. Owen's Life*, vol. i. p. 129, vol. ii. pp. 237 *et seq.*), in advocating benefit clubs with old-age pensions (J. Woodson, *Some Suggestions for the Improvement of Benefit Clubs*, 1824), in seconding Huskisson's and J. Hume's reforms, and in cross-examining witnesses before the committee on agricultural depression, 1821 (Hollander, pp. 105, 109), he did good work. He also proposed to pay off the national debt in one year at about £70 for £100, and to levy duties and grant bounties on corn just enough to countervail exceptional taxation, if any, on British agriculture (Hollander, pp. 58, 98, 99, 115). Perhaps no modern writer or speaker engaged in so many polemics and discussions and yet so completely eliminated the element of self.

M'Culloch's dictum, though tinged with the affection of a friend, may give the present generation some idea of the influence Ricardo had in his time. "The brevity with which Mr. Ricardo has stated some of his most important principles, their intimate dependence on each other, the fewness of his illustrations, and the mathematical cast he has given to his reasonings, render it sometimes not a little difficult for readers unaccustomed to such investigations readily to follow him. But those who give to his works the attention of which they are so worthy, will find that he is remarkably consistent in the use of terms, and that he is as logical and conclusive as he is profound and original. It was the opinion of Quintilian, that the students of eloquence who were delighted with

Cicero, had made no inconsiderable progress in their art, and the same may, without hesitation, be said of the students of political economy who find pleasure in the works of Ricardo: *Sciatis se non parum profecisse cui Ricardo valde placebit*" (M'Culloch, *Literature of Pol. Econ.*).

[*Ricardo's Works*, ed. M'Culloch (1846) contain a Memoir and (a) to (i), and (l 2).] J. D. R.

The importance of Ricardo's position in the history of economic theory is shown most clearly by the nature and vehemence of the criticism with which it has been assailed or supported. Whatever view a critic holds he rarely if ever fails to leave his readers with the conviction that for good or for evil Ricardo's influence has been a powerful force. While much of the diversity in views thus expressed arises out of the different attitudes which modern writers hold as to the correct method of study, much is doubtless due, first, to some definite defects in Ricardo, and secondly, to certain misunderstandings with regard to his works. Among the former may be mentioned—(1) A singularly defective literary style. Not only was Ricardo's vocabulary painfully limited, but he further increases the difficulty arising

out of a too great compression by the use of phrases and words in their more unfamiliar meanings. (2) His assumption of the almost absolute potency of regular competitive forces. This is, it must be admitted, qualified in certain instances; but speaking generally, deviations are treated as temporary and accidental. (3) A frequent reliance on hypotheses which are either obscurely stated or not stated at all. On the other hand, some part of the hostile criticism to which his writings have been exposed has had its origin in (1) the ready but erroneous acceptance of his main publication as being in his view a systematic treatise in economics; (2) the assumption that he was unwilling to recognise the validity of any but the most rigidly economic considerations. With regard to the first of the foregoing, the words of the preface to the *Principles of Political Economy and Taxation* are sufficient to disprove any intention on Ricardo's part to put forth a systematic treatise, so unequivocal is his own statement. Speaking of himself, he says: "It will not, he trusts, be deemed presumptuous in him to state his opinions on the laws of profits and wages, and on the operation of taxes. If the principles which he deems correct should be found to be so, it will be for others more able than himself, to trace them to all their important consequences"; while in what are almost the opening words he indicates as his subject an investigation into the laws which determine the proportions in which the total produce is divided among the different classes of the community. With regard to the second point, the publication of his letters to Malthus within comparatively recent years has done much to correct the exaggerations which formerly prevailed. But even when such misapprehensions are removed there remains considerable ground for criticism as to his methods and works. A final judgment as to their value must take into consideration certain other matters, as to the state of economics at the time when he wrote, and the alterations which he introduced into the treatment of certain portions of his subject. His influence and the importance which has been attributed to his work rest on these even more than on the positive contributions to the knowledge in particular directions contained in his exposition. First of all ranks the prominence which he gives to the problem of value in the general treatment of economics, and in particular in relation to distribution. In the second place, his qualitative treatment of wages, profits, and rent amounted to a kind of revolution in method. Lastly, it must not be forgotten that so far as distribution and exchange are concerned, Ricardo, however faulty in his own scheme, did much for his time by actually presenting a scheme that was coherent, and which, while requiring in some cases modification, in

others reconstruction, afforded even hostile critics the benefit of something to criticise. In certain early stages of a study, systematic, even if inaccurate, statement is a matter of such fundamental importance that its subsequent correction or supersession should not avail to blind the eyes of later generations to the benefits conferred by the scholar who boldly endeavoured to combine and connect the floating opinions of his time. In this respect Ricardo did much. He brought the matter as it were out of the air, and in respect of certain problems endeavoured to sketch a definite plan. This will be seen best of all by a consideration of his writings, after which his more special contributions will require notice.

Ricardo's economic writings may be divided according as they deal with general economic theory, taxation, currency, and agriculture and protection. While this order has been chosen for purposes of convenience, it is the reverse of his historical arrangement—a matter of no little importance, inasmuch as it shows that instead of proceeding from the formulation of certain general principles to particular subjects, he approached the former through his study of the latter, and hence was likely to bring with him a not unnatural prejudice in favour of the methods which he had found useful in resolving the problems to which he first applied himself. Viewed chronologically, his *Principles, etc.*, is preceded as well as followed by writings on currency and the price of corn.

In the *Principles of Political Economy and Taxation*, without doubt the most important with regard to the general treatment of economics, there are three leading subjects of discussion—value, wages and profits, and taxation. Taking, however, the professed aim of the book, it would perhaps be even better to say that it falls readily into two portions—one concerned with the mode in which the wages and profits are proportioned, the other with the effects of various taxes, preceded by a preliminary discussion on value as a necessary principle to their respective determination. As has been elsewhere indicated, the somewhat desultory arrangement of the work, and especially of the later chapters, tends to conceal the definite aims which Ricardo explicitly had in view, which are stated above. A better classification of the chapter would make this clearer. He begins by a discussion as to the nature of value, and the possibility of a perfect standard of value, in which he arrives at the position that commodities exchange in the ratio of their respective cost in terms of labour. With regard to this there are two important qualifications. Labour is the common unit of exertion, in quantitative terms of which all labour, skilled and unskilled, and all capital, are capable of representation. Such exchange or value, while the natural, is not necessarily the market rate, which varies owing to accidental and temporary causes. In defining value, a distinction is drawn between relative value and absolute value; while the meaning of the former term is not in doubt, absolute value or real value is a conception which requires some

little consideration, for it is to its somewhat careless use that some of the misunderstanding of Ricardo's theory of value is due. Strictly conceived, it corresponds to the relation existing, not between commodities amongst themselves, but between any commodity and its labour-cost. If the quantity of labour required in the production of a commodity diminishes, the real (taken for absolute) value falls; if it increases, the real value rises. In most cases, it is obvious, alterations in real value, thus achieved, will be followed by changes in the relative or exchangeable value, for a constant competition is assumed; but if, owing to the progress of invention, there be a general diminution in the amount of effort, or of capital and labour combined, needed to produce a certain quantity or mass of commodities, this given quantity after the improvement will be of less absolute value than before. In other words, while there cannot be a general rise or fall in relative value, there may be a general rise or fall in absolute value. This follows as a matter of course from an attempt to view value as Ricardo viewed it, as the estimate which the individual forms of any commodities as measured by the trouble they cost him. On this conception Ricardo does not dwell at great length, as alien to his purpose, "as the inquiry to which I wish to draw the reader's attention relates to the effect of the variations in the relative value of commodities, and not in their absolute value." The relative value of a commodity represents the degree in which it, as compared with other commodities, partakes of absolute value; thus he speaks of "the relative quantity of labour" as almost exclusively determining the relative value of commodities.

With regard to the definition of value and the use of the term by Ricardo, several points arise for remark. In the first place, the conception of absolute value has been attacked apparently on the ground that it is inconsistent with the view that value is essentially a matter of ratios. This objection does not seem very important in view of the great weight attached to relative value, the small use of value in any other sense or other connection, the somewhat like inconsistency in the more recent use of utility in the utility theory, and lastly the necessity of giving some reason for the relation in which various commodities stand to one another. Such terms as "utility," "estimation," "cost," and the like might have done as well, but the employment of "absolute value" in their place does not seem to require severe condemnation if a careful distinction be drawn between absolute and relative value. In the second place, what is at best a loose phraseology has given rise to doubt as to whether Ricardo did not in some sense regard labour-cost as a cause as well as a measure or index of value. Though the general study of the passages relating to this subject goes far to show that he did not actually fall into this confusion so far as he himself was concerned, his language is inconsistent, and open to grave objection. Lastly, he does not take into consideration the alterations in cost which ensue from differences in the quantities produced.

The discussion of the laws of value issuing in the above conclusions is, like the conclusions them-

selves, a preliminary to a consideration of the laws underlying distribution. No sooner are these approached than their meaning and importance become manifest. They afford the necessary means, the proportional division of the entire product, whatever be the productiveness of the energies of the community, whether they issue in much or little, does not matter, for the question is one of value; "it is not by the absolute quantity of produce obtained by either class that we can correctly judge of the rate of profit, rent, and wages, but by the quantity of labour required to obtain that produce." By treating the problem as one of value, one important result is immediately obtained, for it becomes obvious that rates of remuneration, wages, and profits cannot be a cause of price; that a rise or fall in them cannot occasion a corresponding rise or fall in price. Price being the mere expression of relative value in particular terms, such a consequence would mean a general rise or fall in relative value, or in the ratios in which commodities exchange.

But it may be urged that this position is invalidated by the payment or existence of RENT. Value is a ratio, but in the case of certain commodities their place in the ratio is determined partly by the necessity under which producers are of paying rent? Rent is, however, an exceptional payment, and wholly outside the question of relative or exchange value, which is determined by the relative quantities of effort expended under the most unfavourable circumstances. Thus the total rental of the country is the total surplus of produce obtained by labour exerted under more favourable conditions over that produced by labour under the most unfavourable conditions. An increase in rent coincides, then, with an increase in absolute or real value, and rent itself is formed by the excess of the total absolute value of the produce of the community over what would be the total absolute value were all conditions of production equally favourable. In other words, it is the difference between the actual value in cost of the more favourably produced portions of commodity and the relative value which is given them owing to the LAW OF INDIFFERENCE, and the impossibility of exchanging them at a different ratio from that which holds in the case of the portions produced most unfavourably. It stands wholly outside relative value; the total value remains to be divided among the factors engaged in production. Whatever is not allotted to one is taken by another. The rate at which any one is remunerated depends not on the quantity of commodities received, but on the proportion in which it shares in the whole, and thus a rise in the rate of remuneration of any one class necessarily implies a fall in the case of some other. In this case, as indeed throughout, it has been assumed that all exertion both of capital and labour is capable of treatment in terms of simple labour units in such a manner that with due allowance for temporary deviation, the law of equal reward for equal effort operates. Even in the relations prevailing between the remuneration of different kinds of labour the deviations deserve more than the passing consideration given to them, while between capital and labour, strictly so termed, equality in remuneration

through free competition cannot be said to hold good. In the discussion which ensues as to the division of value between profits and wages, Ricardo, passing by any analysis of interest, centres himself in wages and formulates the doctrine of the variable standard-of-comfort theory, which, with the suppression of the qualifying adjective, has obtained prominence in subsequent controversies as the iron law. Into profits falls the remainder—what is left, that is, after labour has been paid the amount necessary to maintain the necessary level of comfort, and without diminution in its numbers. The uncritical neglect shown in the absence of any treatment of interest is a very great defect in this connection.

TAXATION, which forms the substance of most of the later chapters of the *Principles*, is mainly dealt with from an abstract standpoint, and with the object of ascertaining the ultimate incidence of different taxes. Considerable reference is made to the laws regulating distribution, and in particular to the effect which the standard-of-comfort theory may have in shifting the burden of taxation from the working class to those presumably more able to bear it. In place of regarding the incidence of taxation as being mostly if not invariably on the land, like many of his forerunners, Ricardo contends that taxes may be paid out of three funds—from rent, from the pockets of consumers above the standard of comfort, and from profits, or, if we take his wages theory in its most rigid form, from rent or profits.

In the third group of writings—those, that is, which relate to CURRENCY, Ricardo is at his best. At one and the same time, we find a subject which stood in need of severely logical treatment, and we encounter Ricardo in much fuller mastery than elsewhere of the facts which relate to the matters at issue. Here he is both abstract and inductive. Facts come in sometimes as illustrations which vivify and correct his argument, and sometimes as the very body of the argument itself. The matters dealt with in the financial pamphlets and chapters fall under three headings: (1) the high price of bullion and the depreciation of paper money; (2) monetary theory; (3) the position of the Bank of England. These questions, actually cognate, had at that time an additional if artificial link by reason of the action of the Bank, which, an important agent in the first, conducted through the observation of the effects of its activity to certain important general conclusions. (1) The first question thus indicated occupies the principal part of the two treatises, *The High Price of Bullion*, and the *Reply to Mr. Bosanquet's Practical Observations*. After a few preliminary remarks as to the existing standard in England, Ricardo turns to the discussion of, first, the means at his disposal for testing the value of paper money, and secondly, the action of the Bank with regard to its issue. The means he sets forth as twofold. On the one hand, there is the continuance of heavily adverse exchanges. While such adverse balances may often occur, the extent to which they can continue thus unfavourable is, he urges, rigidly limited by the expenses attending the exportation of the precious metals. On the other hand, there is the continued elevation of the market price of bullion

above the mint price. Here his contention is “not that gold as a commodity may not rise above its value as coin, but that it cannot continue so, because the convertibility of coin into bullion would soon equalise their value.” The point remaining to be considered was as to the power of the Bank to force an undue amount of paper upon the country. Here he replies with remarkable clearness, and in passages many of which rank as classical, to the various contentions raised by the friends of the Bank. He disposes briefly of the argument that it is impossible to augment a currency already adequate by explaining the meaning of “redundant” and “adequate” in this connection, and he points out that the limitation of issue of paper to *bona fide* transactions is no safeguard. (2) So far as general monetary theory is concerned, the above pamphlets, together with the *Proposals for an Economical and Secure Currency*, and chapter xxvii. in the *Principles*, etc., contain the most systematic contributions. The main conceptions treated of relate to (a) the quantity theory of money, which is carefully delineated and afterwards applied to the particular case of paper issues; (b) the distribution of the precious metals throughout Europe, and the conditions under which modifications of the existing distributions may take place; (c) the nature of a standard of value and the use of the precious metals as such. In all these directions he made remarkable additions to the knowledge of the time, while even now his writings stand in the very first rank of monetary exposition. In certain instances, as in the case of a double standard, and what is substantially the system of INDEX NUMBERS, his conclusions, though many economists of the present generation may differ from them, were almost inevitable under the circumstances of the time as to both knowledge and the existing political conditions. (3) As regards the position of the Bank of England, he concludes a biting survey of its action towards the public both as regards the issue of paper money and in sundry other and more general aspects with the contention that the time had come for a very radical change. The direction which this should take is set forth at considerable length in the *Plan for a National Bank*.

Agricultural protection and the importance of a low price of corn form the subject of two pamphlets: *An Essay on the Influence of a Low Price of Corn on the Profits of Stock, and On Protection to Agriculture*, in which Ricardo, basing his arguments on the theory of rent, set forth mainly by Malthus, combats the proposition that agriculture requires particular protection. “With a permanently high price of corn, caused by increased labour on the land, wages would be high; and as commodities would not rise on account of the rise in wages, profits would necessarily fall. . . . Profits would not fall in one trade only, but in all. . . . In this view of the law of profits, it will at once be seen how important it is that so essential a necessary as corn, which so powerfully affects wages, should be at a low price; and how injurious it must be to the community generally, that, by prohibitions against importation, we should be driven to the cultivation of our poorer lands to feed our augmenting population.” In addition,

an irresistible temptation is, he urges, offered to capitalists to quit the country. Moreover, the high prices thus attained are unstable. These pamphlets, which are very unequal, are Ricardo's contribution to the anti-corn law movement, which was slowly shadowing itself forth (see ANTI-CORN LAW LEAGUE).

In addition to writings dealing with the subjects mentioned in the previous paragraphs, Ricardo wrote an *Essay on the Funding System*, in which he deals with the history of the sinking fund, and the various modes in which war expenditure may be met.

While general economic theory was greatly affected by Ricardo's treatment of certain branches, its special development in particular directions was equally due to what may be described as direct and more original contributions to knowledge. Of these, those relating to foreign trade, money and paper issues, and rent, have attracted and deserve chief attention. In these instances his work holds its high position either because of actual originality in doctrine, or because it is so original in statement and combination of ideas which previously were but faint and uncertain suggestions, or wanted their true value through their lack of conviction. With regard to foreign trade, he established the doctrines of comparative cost, and laid down the mode of the distribution of the precious metals. In the treatment of money we owe to him the logical statement of the quantitative theory which led to the clear and comprehensive view of the nature of paper money which we find in his pages (see QUANTITY THEORY OF MONEY). The theory of RENT was restated—while the explanation of its origin in the difference of yield to successive applications of capital and labour is so important as to merit the position of an original contribution.

But while in these respects economic study lies under a very great debt to the writings of Ricardo, in certain other respects his influence, or perhaps more truly that of his followers, was disadvantageous to its sound progress. Though a rational and temperate criticism will relieve him of the responsibility for the particular form of wages theory known as the Iron Law (see LAISSEZ FAIRE), as even HELED admits, his unfortunate mode of expressing himself did much to lead to the socialist conception of value as due to labour and labour alone. But here he and indeed Adam Smith also are to blame rather for defective and careless expression than for bad thinking, while in addition it must always be remembered that in Ricardo's view capital as well as labour was a necessary element in the determination of cost. To the enunciation of this particular point he devoted an important section of his chapter on value. But there are two other defects in English economic writings of the early part of this century which are largely due to the influence acquired by these writings. In them the human agents in economic growth and organisation are treated as inorganic rather than organic units, and as liable to elimination or supersession with no more result than would occur in a physical experiment. They are things of wood rather than of flesh and blood, and are swept round and round in the whirl of competition, to be succeeded in the course of time and

development by others disconnected with them by any vital bond. This apparent conception of society as a mechanical rather than an organic unity, though by no means consciously acknowledged, was an obvious bias of the group of thinkers among whom Ricardo moved, and who on the economic side were his disciples, and has remained until recently as somewhat characteristic of economic thought in England. The fault lies not of course in the rigid adhesion to the conditions of hypothesis, but in the lack of a vivid permanent realisation of the other features and elements to be taken into account in the application of theory. The second of the two defects mentioned above is one for which his followers rather than Ricardo himself are to blame, for despite his warnings they chose to elevate his principal writings to the rank of a treatise, thus attaching the title of political economy to what was a partial treatment of but one branch of the subject. In this even they did not stand alone, but their action did much to narrow economic study and to mislead popular opinion into misconception as to the nature of political economy.

The incomplete character of Ricardo's work, with its splendid merit and its frequent defects, is largely due to the period in which it was produced. Like Adam Smith he worked and wrote in the very early dawn of sound economic study, and their progress is that of men walking in the morning twilight of science. Others have entered into their labours. If we wish to gauge the true importance of such, and especially if we wish to arrive at some general conclusion with regard to the position of Ricardo, we must take into account the time at which he wrote as well as his writings, and estimate the value of the latter as the necessary preliminary to much subsequent work on theory, and as affording by the distinctions contained, by the relations indicated, and by the generalisations arrived at, often crude, sometimes erroneous, and in most cases tentative rather than final, opportunity for much inductive inquiry.

E. C. K. G.

**RICCI, LUDOVICO (1742-1799).** Born at Castagneto, near Modena, Central Italy; he filled different offices in the duchy, chiefly connected with reforms in charity organisation and taxation. In 1797, after the revolution, he became one of the directors of the Cispadane republic; when this became merged in the Cisalpine republic, the directory appointed him minister of finance. He employed himself during his ministry in reorganising the taxes and the treasury of the republic, then empty; and drew up, by order of Napoleon, a plan of financial reforms which was highly esteemed by him. In 1798 Ricci was made general commissioner of the taxes of the republic, and died shortly afterwards.

Ricci left many papers, some unpublished, on economic and financial questions. The most important is the *Riforma degli istituti più della città di Modena*, a valuable monograph, full of historic and scientific statistics. The depressed condition of the lowest stratum of the working classes in Italy,

during the time of Ricci, compared with the fairly favourable condition of beggars, to some extent sheltered and relieved by charitable institutions, showed the necessity of a better distribution of the assistance given. The economic problem of the administration of charity forced itself on the government of the Italian states, rich in charitable institutions, and several governments studied the question. At Modena the investigation of the subject was entrusted to Ricci; hence his valuable work, which far surpasses the limits of a monograph relating solely to a small state. He treats the subject of the reform of charitable institutions from a rational and systematic point of view, studying the problem deeply, and analysing the origin of charitable institutions which have their root in the moral and religious feelings of man, and tracing historically the progress and influence of such institutions. He further examines the causes of beggary, the vices and wants of the different classes of the poor, and maintains that the reorganisation of charity should be based on the elevation of moral character.

He shows the economic disadvantages of an improvident system of public charity, that it tends to the increase of beggary and of the numbers of the poor. It is necessary, says Ricci, that they should shake off their indolence and either emigrate or perish. Their indolence is fostered by alms-giving, which supplies a continuous stimulus to beggary, which increases proportionately to the development of charitable systems. Those poor only who are unable to work should be relieved, those able to work helped solely by work being procured for them. Following these lines, he examines minutely the charitable institutions of the town of Modena, shows the numerous evils they cause, and proposes a series of gradual and progressive reforms calculated to transform them completely. These reforms in great measure are in accordance with modern ideas.

Ricci's views on population are interesting theoretically. He has been called a precursor of Malthus; but, though he touches on the population question, he regards it from a different point of view from Malthus, and more closely approaches modern scientific conclusions. He has in fact the idea of a relative excess of population, apart from its absolute excess, and asserts that though the increase of population may be at a minimum, yet the lowest stratum may be in a most miserable condition. From these conceptions, which, however, Ricci merely points out without fully developing, he deduces his maxims for directing the organisation of charity so as to alleviate misery without fostering it.

Among his unpublished manuscripts Ricci left an outline of a treatise on taxation, conceived with a width of view, originality of plan, and deep learning, which he was not able to finish. He considered social economy a dynamic system of force, which sometimes acts in contrary ways, destroying itself by its own results. He regarded taxation as a moderating element in eliminating the causes of this dispersion of prosperity.

RICHARD DES GLANIÈRES (belongs as a writer to the second half of the 18th century).

In 1774 he presented to Turgot his *Plan d'Imposition économique et d'administration des Finances*, on which he was congratulated by the body of merchants of La Rochelle; he maintained his scheme in the *Réplique générale pour le présent et l'avenir aux observations faites et à dire sur son plan* (1775), and in the *Dixme oyale de M. le Maréchal de Vauban comparée avec le plan d'imposition de M. R. D. G.* (1776).

He is an admirer of TURGOT and an advocate of free trade in corn, which he supports by the authority of SULLY. In his financial plan, which he regards as derived from VAUBAN, he would remove all the then existing internal customs duties to the frontier and would do away with the whole existing system of internal taxation, establishing instead, first, a graduated poll-tax, to which he gives the name of *impôt de franchise*, calculated on the estimated consumption of each tax-payer, and secondly a real *TAILLE* or direct tax on every kind of property, including annuities. His statistical basis of taxation must certainly have been faulty, for he computed that about 800,000 persons would pay 200 francs (say £8) or more, but in 1847, when this amount was the legal qualification of a voter, there were shown to be only 250,000 persons directly taxed to this amount in France.

[E. Fournier de Flaix, *Les théories fiscales en France et en Europe aux XVII<sup>e</sup> et XVIII<sup>e</sup> Siècles* (vol. i. of *La Réforme de l'Impôt en France*), pp. 217-220, Paris, 1885.] E. CA.

RICHELIEU, A. J. DU PLESSIS, CARDINAL DUC DE (1585-1642). Cardinal Richelieu deserves a place in economic history not so much on account of what he did as on account of what he failed to do. The central administration of monarchical France was on the whole a very efficient machine, but it had one fatal defect—the financial system was extraordinarily bad. Adam Smith (bk. ii. ch. ii.) has clearly pointed out the inferiority of French to English finance in the 18th century, and there can be little doubt that this inferiority was one of the chief causes of the failure of France to hold her own in the naval and colonial struggle with her great rival. At the same time it was the chronic deficit due to defective finance, and the discontent aroused by ill-devised and oppressive taxation, which led directly to the downfall of the French monarchy and social framework in the revolution.

It would, of course, be absurd to make Richelieu responsible for economic blunders, many of which were far older than his administration. At the same time it must be admitted that his failure to introduce financial

reforms did much to stereotype evils which none of his successors were strong enough to cope with. Richelieu was the one man in French history who had the strength both of will and of position which might have enabled him to trample on the opposition of the powerful classes whose interests impelled them to oppose reform. Some of the most obvious of the existing evils were the exemptions enjoyed by the privileged orders—the system of selling offices and of farming the indirect taxes (see FARMER-GENERAL; FARMING TAXES), the oppressive incidence and excessive amount of the TAILLE, and the almost ludicrous harshness and inequality of the GABELLE.

Richelieu was no trained economist, but that he was keen-sighted enough to realise the need for reform on these points is proved by innumerable passages in his memoirs, and also by a draft of proposed changes which he drew up for the king in the first year of his ministry. But he never made any serious attempt to carry his schemes into practice; on the contrary, in his later years the pressure of military expenditure led him to strain to the utmost all the old expedients, and to impose the most oppressive burdens on the tax-payers. And so immense was Richelieu's prestige and the weight attached to his example during the next century and a half that his financial maladministration may be said to have done as much for the ultimate weakening of France and her monarchy, as the triumphs of his foreign policy effected for their immediate exaltation.

At the same time it would be unfair to lay too much stress on this negative side of Richelieu's domestic administration. He reformed the army and practically created the navy of France. He did all in his power to encourage the growth of a mercantile marine, and to extend French commerce and colonisation. It is true that many of his schemes were costly failures, and that French companies too often added to the general defects of such corporations an excessive dependence on state patronage. Still it must be admitted that Richelieu is entitled to some measure of the credit which is usually given to COLBERT for that stimulus to economic and commercial progress which helped to make France for a time by far the first power in Europe.

R. L.

RIDOLFI, COSIMO (1794-1865). Born in Florence, of noble family, of great literary and scientific attainments, an educationalist and minister, and, in particular, a distinguished agriculturist. He travelled widely to carry out his study of agriculture. Ridolfi occupied himself greatly with the condition of Tuscan agriculture, and worked, with good results, to improve it practically. He established at his farm at Meleto a school of practical agriculture, mainly to supply practical instruction in this subject to the sons of landed proprietors. At the same

time he interested himself in improving the condition of the peasant class. After this, at the university of Pisa, Ridolfi taught agriculture and founded a school for instruction in the subject there. He was one of the ministers of Leopold II., grand duke of Tuscany, in 1849, then plenipotentiary at Paris and London. In 1859 he became a minister with the Tuscan government, and afterwards a senator of the kingdom of Italy.

He wrote many important papers on agriculture and agrarian economics, published in the *Atti della Accademia dei Georgofili di Firenze* and in the *Giornale Agrario Toscano*.

[Lambruschini, *Elogio del Marchese Cosimo Ridolfi, agronomo fiorentino*, Florence, 1866.]

U. R.

**RIGHT TO LABOUR.** A party watchword is often said to be most popular when ambiguous. This condition is satisfied by the "right to labour," which may be understood in two quite different ways. It may be taken to mean a right, moral or legal, of able-bodied persons, rendered destitute by exceptional circumstances, to temporary maintenance out of the public funds, labour being indicated as at once the test of destitution and the channel through which, by the wages paid for it, relief is administered. Or it may mean a supposed natural right of every citizen at all times to have secured to him by the state, when he alleges that he cannot find it for himself, employment of the kind he is fitted and has been trained to perform, so remunerated as to enable him to support his own existence and that of those dependent on him. It is in the latter sense that the phrase was for some time widely current in continental politics; and most of the democratic agitators who asserted the *droit au travail* would have repudiated as inadequate, and perhaps as degrading, the interpretation which would make it equivalent with the *droit à l'assistance*.

Some writers have erroneously supposed that this right was asserted by the PHYSIOCRATS. What they claimed for every member of the community was not the *droit au travail*, but the *droit de travailler*, which was altogether different, implying only a right to the removal of all restrictions which impeded industry and prevented the poor man from living by his labour. "Ce que l'état doit à chacun de ses membres," said TURGOT, "c'est la destruction des obstacles qui les gênaient dans leur industrie"; and, in proclaiming this *droit de travailler*, what he had mainly in view was the abolition of the GILDS and other privileged corporations (see CORPORATIONS OF ARTS AND TRADES).

FOURIER was the first to introduce the claim, and the phrase associated with it, into the literature of social economy. In his earliest work, the *Théorie des quatre mouvements* (1808), and in his later *Théorie de l'unité universelle* (1822), he formally asserted the right, but

declared it to be impossible to realise it under "the régime of civilisation," that is to say, the existing economic order of society. He declares it to be the first and most important of the rights of man, without which all the rest are valueless. It is, according to him, the equivalent due to each individual of the means of subsistence by natural products, which every one possessed in the primitive state of barbarism, and parts with on his entrance into society. Considérant rests it on the same theoretic basis; he urged its practical adoption as a means of transition from the present to the future (Fourierist) order of things. ST. SIMON also appears to assert the right; but his want of scientific precision and his frequent self-contradictions make it difficult to affirm this with certainty. Louis BLANC conceives the right as a corollary of the right to existence, which he alleges to belong to every man at his birth, as a gift from his Maker.

The right to labour came avowedly into the field of practical politics at the revolution of 1848. By the decree of the 25th of February (see *ATELIERS NATIONAUX*) the provisional government announced that it "s'engage à garantir du travail à tous les citoyens." These words were dictated by Louis Blanc. J. S. MILL maintains that the *droit au travail* thus sanctioned meant "the poor-law of Elizabeth and nothing more." If more was not intended, it must be admitted that the authors of the decree were singularly unfortunate in the language they used. Louis Blanc seeks to shelter himself from blame by quoting Mill's view; but his opinions and objects, as stated by himself, are irreconcilable with that view. He says that the engagement which the government was undertaking—involving, as it did, "vast difficulties"—was intended for future, not immediate realisation, and that it could not be brought into practical operation except by the introduction of his own socialistic schemes. What he really aimed at, as he frankly informs us, was to lead the government to adopt those schemes by inducing them to issue the compromising decree. Whatever that decree may have meant, it is certain that when the bourgeoisie triumphed over the revolution, it was only a right to relief that was recognised in the constitution, and statesmen who had seemed to give the principle a wider construction explained away what they had previously said.

In Germany, FICHTE maintained the right as a consequence of the social compact (*Naturrecht*, 1797). Under French influence it was advocated by Ludwig Gall, the Fourierist Stromeyer, MARLO, and others, and the recognition of it was proposed in the Frankfort parliament, but without success. It was asserted in the broadest manner by Bismarck in the Reichstag in May 1884: "Ich erkenne ein Recht auf Arbeit unbedingt an"; but he took no step to carry it

into effect. In Switzerland, it was made the subject of a REFERENDUM in 1894, and was supported by 75,880 against 308,209 votes. But though it was for a considerable time a favourite cry of the radical democracy of the continent, in England it never made any appreciable impression; it has been abandoned by the socialists, who now recognise, with Fourier, that it is unattainable under the existing conditions of industry, whilst it would be an immediate and spontaneous result of the establishment of the new organisation which is the goal of their efforts. It is, indeed, obvious that its practical adoption would lead directly to a socialistic system (see *SOCIALISM*). The members of a government undertaking to provide every applicant with labour such as he has learned to perform would become ENTREPRENEURS on the largest scale, agricultural, manufacturing, and mercantile, with a host of subordinates acting as overseers; and the private employer would be driven from the field.

When it is seen that there are no such things as natural rights, the right to labour disappears with other similar coinages of metaphysical politics. But when we approach the subject from the side of duty, the course to be followed seems sufficiently plain. Some regular means of relieving destitution should exist to meet the exigencies of individuals, and when they can perform work, it is reasonable to expect it from them as a partial return for the assistance they receive. When a great public calamity, such as failure of crops or a commercial crisis, plunges considerable districts of a country into distress, the government can best intervene by employing the able-bodied, who are without their ordinary means of support, in useful public works, whilst gratuitously maintaining the immature, the aged, and the infirm. The management of public works under these circumstances has obvious difficulties, but difficulties are no sufficient reasons for abstaining from action. The principal are those of determining who are fit objects of this sort of public aid, and what are the best works to be undertaken. On the ground of this double difficulty, such works will be more properly placed in the hands of local authorities than in those of the central government, though at least a share of the required funds ought to be supplied from the national exchequer, and consequently a power of general supervision should be reserved by the national executive. Even in such extreme cases, government, whilst bound to do their utmost towards providing labour, ought scarcely to guarantee it to all, such a promise being only too likely to prove incapable of fulfilment, whilst it would tend to stifle the exercise of private benevolence.

In ordinary times, one of the most serviceable kinds of action open to them for the benefit of the unemployed is the establishment of BUREAUX

OF LABOUR, having for their function the collection and circulation of trustworthy information as to the demand for labour in different localities.

Ec.*—Ritchie, *Natural Rights*.—Jevons, *The State in relation to Labour*.] J. K. I.

RILEY, HENRY THOMAS (1816-1878), a distinguished historical antiquary, edited and translated a large number of the most valuable "sources" for English municipal history in the middle ages.

For the Rolls Series, Riley edited the *Municipalia Gildhallæ Londoniensis* (1859-1860).—For the Corporation of London, he translated the *Liber Albus* (1861), and a volume of extracts from the city archives for the period 1276-1419, under the title *Memorials of London and London Life* (1868).—For the Hist. MSS. Commission he inspected and reported on the archives of various municipal corporations (from 1869 onwards). But this by no means exhausts the list of his works.

J. K. I.

RIN, a coin, the 1000th part of 1 yen (see YEN), 1000 rin = 100 sen = 1 yen (Japan).

RING. A ring in American politics is a group of partisans who agree to work together in order to get paid, elective, or public appointments apportioned among themselves in a certain way. The Tweed ring went further than this; and the officers when appointed agreed to exclude financial criticism. In Europe a ring is non-political, and means (1) an agreement (2) by capitalists (3) to exclude competition, and (4) so control and dictate terms to the market. (1) Monopolies are founded on privilege; and American trusts, French omnium, and English amalgamations, involve transfers of property, but rings are mere agreements. The agreement takes many forms. It may be an agreement not to sell on a given day below a certain price; or, as in the perfected *syndicats industriels* of the Continent, to create permanent agents who sell what members produce and pool profits according to elaborate rules. These agreements are usually void at law, either because they are "against public policy," as in England and U.S., or "against free trade," as in France, or against a law, e.g. the Austrian Law of 7, iv., 1870, § 4; indeed they are often called "gentlemen's agreements," "presidents' conferences," "consensus," as opposed to contracts (G. O. Virtue, p. 314). (2) Labourers' unions are not rings but sometimes join rings (*Ec. J.*, 1897, pp. 503-510). Subtler rings take in allied trades, thus American coal-rings, in imitation perhaps of the Newcastle VEND, are formed of carriers

and producers. (3) It often kills competition by rebates, differential freights, maximum and minimum tariffs, and by recklessly underselling opponents—operations which resemble retaliatory tariffs and bounties between nations. (4) Control of the market and restricted production and enhanced price is the ultimate aim of all rings, *syndicats industriels*, trusts and monopolies. Hence efforts have been made to bring them within the criminal law. But the net has been spread too wide. The French Code Pénal (art. 419) penalises any combination to raise prices by not selling a commodity under a certain price; this, like our "engrossing" (see FORESTALLERS AND REGRATORS), hits all trade, and is therefore a dead letter. The Canadian Act of 1889 (52 Vict. c. 41, § 1 (b)) and U.S. Act of 1890 (§ 1) make contracts in restraint of trade criminal; now such contracts occur every day between shopkeepers and their former partners or assistants, so the judges held that this provision could only apply where dealers "practically control the entire commodity"—which is almost unprovable (52 *Federal Reports*, 104, 119). Other clauses of the Canadian act penalise contracts to unduly limit competitive production or sale—as though judges could tell where there is no over-production or unfair price. Similar objections were held fatal to an attempt made to bring a ring of shipowners within the English law of conspiracy ("Mogul S.S. Co. v. MacGregor," *Law Reports* (1892), App. Ca., p. 25; see Lord Bowen's judgment). There are many immoral practices on the part of rings; but competition, public opinion, and what Andrews calls "the tolerance of the market," have hitherto proved a more effective remedy than this abortive recrudescence of mediævalism.

RING MONEY, probably a specialised form of bar money; seems to have been in use at a very early period in the east, where, as in the west,

it preceded coined or stamped metal. That the Egyptians employed ring money is proved by their extant paintings, where heaps of rings of gold and silver are represented as weighed in scales. Some have thought that a metallic currency of this kind is alluded to in Gen. xliii. 21, where the sons of Jacob find their "money in full weight" in the mouths of their sacks.

Ring money still circulates in Africa, and under the name of *Manillas* is yet manufactured at Birmingham for African trade.

From the east, ring money probably found its way into Europe, and into Gaul and the British Isles, where Cæsar found it in circulation. "They use," he says, "either brass money or gold money, or, instead of money, iron rings adjusted to a certain weight" (E. Hawkins' *English Silver Coins*, pp. 8, 9, London, 1841, 8vo). One specimen found in Orkney is composed of three bars of gold twisted together like a cord. A remarkable silver chain of thirty-three rings weighing over ninety-three ounces, now in the Museum of the Scottish Antiquities, was dug up in 1805 near Inverness. About the middle of this century a hoard of silver ring money was found in the cuttings for the Waterford and Kilkenny railway, but unfortunately it was dispersed and lost with the exception of one ring, concerning which the Rev. Jas. Graves read an article before the Kilkenny Archaeological Society on 16th March 1853.

**RISK** (as element in cost of production) is the negative of the quantity which Laplace calls *espérance*, that is, probability multiplied by advantage. The advantage may be either "mathematical" or "moral," measured by value in exchange or value in use. When there is an even chance of obtaining a certain sum, the mathematical expectation of gain is exactly balanced by the risk; but the utility which would be lost by the subtraction of the sum is greater than what would be gained from the addition thereof. "Gambling involves an economic loss, even when conducted on perfectly fair and even terms" (Marshall, *Principles of Economics*, bk. iii. ch. vi. § 6, note 3rd ed.). Conversely, "a theoretically fair insurance against risks is always an economic gain" (*ib.*). The subjective "loss" is less, *ceteris paribus*, the less the "marginal utility" of money to the person incurring risk. This principle applies to the risk run by the capitalist entrepreneur, against which insurance is usually not available. The advantage which a large business has in being able to encounter risk has been lucidly pointed out by Professor J. B. Clark. The principle partly accounts for the growth of joint-stock companies.

Indemnity for risk, as explained by Mill

(*Pol. Econ.*, bk. ii., on "Profits"), forms one element of gross profits. If we ascribe the other two elements—an "equivalent for abstinence," and "remuneration for the labour and skill of superintendence"—to interest and earnings respectively, remuneration for risk seems to remain as "pure profit."

It is difficult, however, to abstract risk from the care exercised by him who incurs it. "This use of the term" (profits), says Professor Marshall, "is on the whole not advantageous, because it tends to class the work of management with mere routine superintendence" (*Principles of Economics*, bk. vi. ch. viii. § 2, 3rd ed.). Risk, as an element of profit, appears in its purest form—most detached from labour of superintendence—in the case of joint-stock undertakings.

[Laplace, *Théorie Analytique des Probabilités*, ch. x. (De l'espérance morale).—Mill, *Pol. Econ.*, bk. ii. ch. xv.—J. B. Clark, *Quarterly Journal of Economics*, vol. v. p. 313 ("profit in an accurate sense of the term . . . results from an unbalanced condition of industrial groups").—*Ibid.*, vol. vii.—*Insurance and Business*.—Marshall, *sub voce*, "Risk." For increased value owing to absence of risk see PREFERENCE SHARES.] F. Y. E.

**RISTOURNE** (Fr.). A term of marine insurance meaning the return of a part of the premium in the case mentioned in the *Code de Commerce*, art. 349, that is to say, in the event of the voyage being abandoned before the departure of the ship, in which event the insurer, instead of receiving the agreed premium, is entitled to  $\frac{1}{2}$  per cent of the insured value, by way of indemnity. Over-insurance is also a case for a *ristourne*. T. L.

**RIXDALER** (Dutch). The Riksdaler is a Dutch silver coin of the same weight, 25 grammes, or 385·8 grains, as the five franc piece, but of the millesimal fineness of 945, instead of 900. It thus contains 364·58 grains of fine silver, as compared with 347·22 grains, the fine content of a five franc piece.

The weight and fineness of the riksdaler were fixed by a law passed on 22nd March 1839. Prior to that date the weight had been 28·078 grammes, and the fineness 868, in accordance with the provisions of the law of the 28th September 1816. Before the passing of the last-mentioned law, the legal fineness had been 869·792.

Riksdalers are current in the Netherlands, where they pass as 2½ gulden pieces, but they circulate mainly in the Dutch colonies.

In Ceylon, Malacca, and the Cape of Good Hope, originally Dutch colonial possessions, the rixdaler was retained as the basis of the currency systems of those countries for many years after they became British colonies, and in the case both of Ceylon and the Cape, which finally became British possessions in the years 1795 and 1806 respectively, it was not until about the year 1840 that paper rixdalers were finally removed from circulation.

F. E. A.

ROBERTS, LEWES (died 1641), merchant and captain of the city of London, belonged to a Beaumaris family, and was born in the Isle of Anglesey. He was a member both of the East India Company and of the Levant Company of Merchants. The 1st dedication of his *Mappe of Commerce* is to Alderman Abbot and Alderman Garraway, the governors of these companies; the 2nd dedication is to the Harvey family, of whom William Harvey, D. of Phys., was the first, which he had served as a factor; the 3rd dedication being to the merchants of England in general. The eulogies in verse—including the graceful lines signed Iz. Wa.—are witnesses to the respect in which the author was held. His sons Gabriel and William were also merchants (for the former, see *Memoirs of the Verney Family*, iii. 371).

His *Merchant's Mappe of Commerce*, 1638, very highly extolled on its appearance, is a handbook of practical mercantile knowledge, compiled with immense industry and care, and showing an intimate acquaintance with foreign customs and writers on commercial subjects. Besides the geography of the world, it contains a mercantile description of all places of any importance, of their produce and exports, their weights and measures, currency and exchanges, and of the course of their trade not only with England but with every other country concerned.

In his *Treasure of Traffike, or a Discourse of Forraigne Trade*, 1641, which he dedicated to parliament, Roberts ventured into the region of theory. The tract was an appeal for the encouragement of commerce by the state, and suggested state control through authorised merchants of experience. In it he advocated trading companies with geographical limits rather than independent adventurers; he laid stress on the importance of good roads and other internal communications, and on the necessity for a sound coinage; he upheld staple towns; he deprecated monopolies and private patents, and argued against heavy customs. While slightly discussing the policy of protective duties in general, he entered at some length into that of prohibiting altogether the export of the precious metals, showing by some examples that money might be plentiful or scarce independently of the laws regarding its exportation.

[*Harleian Soc. Publications*, vol. 17, p. 202, vol. 37, p. 4 (date of burial 12th March 1640, presumably old style, really 1641), and vol. 8, p. 323 (Neve's *Book of Knights*).—Introductory pages to 1st ed. of *Mappe of Commerce*, 1638.—Macpherson, *Annals of Commerce*, an. 1641.—McCulloch, *Literature of Political Economy*, p. 37.—Rogers, *History of Prices*, vol. vi. p. 7.—MS. note to title-page of *Treasure of Traffike*, Brit. Mus. copy, 1641.]

E. G. P.

ROBERTSON, GEORGE (born a few years

before 1765, living in 1829), a practical farmer and writer on agriculture. He lived in Midlothian, where he had a farm at Granton near Edinburgh, until 1800, in Kincardineshire till 1811, and at Irvine in Ayrshire, where he was factor to the Earl of Eglinton, probably until his death.

He was employed to draw up descriptions of the counties he knew best for the *General Report* of the agricultural state of Scotland which was brought out under the supervision of Sir John SINCLAIR (q.v.). Robertson's *General View of the Agriculture of Midlothian* was printed, in its preliminary form, in 1793; his *Agriculture of Kincardineshire, or the Mearns*, not until 1813. His reports are comprehensive and detailed, describing the state of roads, farm buildings, live-stock, tillage, implements, wages, etc., with a good many careful statistical tables. He contributed also some minor papers on special subjects, for example, on woods and plantations.

Besides these official reports his chief work was, *Rural Recollections, or the progress of improvement in Agriculture and Rural Affairs*, 1829, a book full of interesting information, chiefly drawn from his own knowledge of the three counties in which he had lived. Ch. xii. of the description of Midlothian contains an account of the old runrig cultivation (see RUNDAL). He was a keen and intelligent observer and a pleasant writer, confining himself almost entirely to facts, except when he touched on the corn laws, which he strenuously upheld against the free trade theories of the day.

His other works were less important: A continuation up to date of G. Crawford's *General description of the shire of Renfrew*, 1818; and a *Topographical description of Ayrshire, more particularly of Cunninghame*, 1820.

[Title-page of *Report on Midlothian*.—*Rural Recollections*, pp. 7, 8, for autobiographical details.]

E. G. P.

ROBINSON, HENRY (fl. 1641-56), merchant, parliamentarian, and member of the committee for taking the accounts of the Commonwealth (*Cul. of State Papers, Dom. Ser.*, 1654, p. 287), was the author of one important book, *England's Safety in Trade's Encrease* (1641); his other works, e.g. *Briefe Considerations concerning the Advancement of Trade and Navigation* (1649); *Office of Addresses* (1650); *Certain Considerations, etc.* (1651); *Certain Proposals, etc.* (1652); *Certain Proposals, etc.* (1653), are of practical value, but do not elucidate his economic theory.

His conception of wealth was in advance of his age. According to A. Smith (*Wealth of Nations*, bk. 4, ch. i.), the title of MUN's book, *England's Treasure by Foreign Trade, or the Balance of our Foreign Trade is the Rule of our Treasure*, was the fundamental maxim of that age, and no writer looked on home trade as wealth unless it subserved foreign trade. The title of Robinson's book and of ROBERTS's *Treasure of Traffike* (1641), and such sentences as these about home trade, "accord-

ing to the increase whereof the nation is not only accommodated and enriched either by what they deal in or with what they stand in need of, but" its foreign trade is enhanced (*B. C.*, p. 3), "the wealth and welfare of this kingdom may justly be measured by the kingdom's traffic" (*E. S.*, p. 24), reveal glimpses of a larger view, which also found official recognition (Scobell's *Parliament Acts*, 1656, c. 5, preamble). These three books dealt the first, A. Smith dealt the final, blow at that mediæval hostility to trade to which Sully and Francis BACON had imparted new life (cp. Hahl, *Zur Geschichte der volkswirtschaftlichen Ideen in England*, 1893, ch. v.). Again, Robinson praised trade because it "makes a nation populous" (*C. P.*, 1653, p. 13): FORTREY (1663) and his successors converted and therefore caricatured this proposition. Again, MUN, MISSELDEN, and ROBERTS always wrote that increased trade meant increased revenue: Robinson's warning that trade will not be more unless customs are less, so that revenue will neither swell nor shrink, snapped this last link between English economics and Bodin's identification of revenue and national wealth (*E. S.*, p. 9; *B. C.*, p. 7). Again, VON HEYKING (*Zur Geschichte der Handelsbilanztheorie*, 1880, p. 77) suggests that Robinson invented the plan of transferring customs from exported to imported manufactures, and especially to luxuries. This plan was an obvious application of the creed of the BALANCE OF TRADE (*q.v.*), which since STAFFORD (1581) had had a sumptuary tinge (*ib.* p. 67); MISSELDEN foreshadowed it (*Circle of Commerce*, 1623, pp. 134-135), and ROBERTS approved of it (*T. of T.*, pp. 36-39). Again every pamphleteer, notably HITCHCOCK (1580), GENTLEMAN (1614), and S. SMITH (1661), recommended the home fishery as a cure for beggary and substitute for workhouses: many, like KEYMOR (1601), pointed out in Robinson's words that "all other trades will follow of their own accord, one as it were begetting another," that it was what A. Smith called productive labour; I. R. (*The Trade's Increase*, 1615) urged the strength it would add to the navy, and lamented the waste of East Indian sailors and ships (one of which was named *The Trade's Increase*). Robinson held on all these philanthropic, economic, and political grounds that home-fishery and East Indian trade—he purposely omits the wool trade—were England's two chief sources of wealth and strength, and wished to encourage fishing by reviving the quaint laws instituting compulsory fast-days (2 & 3 Ed. VI. c. 19; 5 Eliz. c. 5, § 12, etc.; cp. *Parl. Hist.*, iii. 253), and by driving Dutch fishermen from our shores unless they settled, or half the crew and owners of their boats were English. This numerical compromise was old (1 Hy. VII. c. 8), and reappeared in 1660 (12 Car. II. c. 18, § 6). Robinson's pleas for a national bank (*E. S.*, p. 34; *Cal. of State Papers, Dom. Ser.*, 1650, p. 182, 1654, p. 364), for a labour (*O. of A.*), land, and wills registry (*C. P.*, 1652, pp. 18, 21), one supreme court of equity and common law (*C. P.*, 1653, p. 23), and county courts (*ib.*), were new then, and bore fruit long afterwards.

Other schemes reflected the views of various schools. Thus, he echoed MISSELDEN's plea for stricter aulnage, "a mont de piété," etc. (see

AULNAGER; MONTS DE PIÉTÉ) while he swallowed Malynes's nostrum for regulating exchange (*B. C.* pref.). Like CULPEPER, MISSELDEN, and MALYNES, he wished to limit interest by law, and succeeded in 1651; although like MISSELDEN and Malynes he attributed high interest to scarce money. Like MISSELDEN and ROBERTS, he advocated mercantile courts, assignable debts, and the incorporation of traders trading to one place: his language on this last head is peculiarly like that of ROBERTS (*E. S.*, p. 45; *T. of T.*, p. 51).

J. D. R.

RODBERTUS, KARL JOHANN (RODBERTUS-JAGETZOW) (1805-1875), was born at Greifswald in Swedish Pomerania, where his father was professor of law in the university. The elder Rodbertus removed in 1808 to Mecklenburg-Strelitz, where his wife possessed landed estate. The son was a student of law at Göttingen and Berlin from 1823 to 1826. After being employed for some years in legal offices in Prussia, he studied political economy, history, and philology at Heidelberg, and then travelled in France, Switzerland, and Holland. He purchased in 1835 the estate of Jagetzow in Pomerania (from which he is often called Rodbertus-Jagetzow), and resided there from 1836, taking an active part in local administration, and much occupied with the management of his property. He became in 1847 a member of the provincial diet, and sat in the second united diet. He was active in the struggles of 1848 as a warm supporter of German unity, and, at the same time, an earnest maintainer of the independence of the popular assembly as against the crown. He was appointed minister of public worship and instruction in the Auerswald administration, but very soon resigned in consequence of a disagreement with the other members of the government. After 1849 he retired from public life and devoted himself altogether to social studies.

Rodbertus's writings produced little effect in his lifetime, and he was not held in much esteem as an economic theorist until some recent writers—especially Adolf Wagner—brought his name into prominence. He is now regarded, except by the partisans of Marx, as the father of the so-called scientific, as opposed to the utopian, socialism. At first, we are told, an enthusiastic believer in traditional economic doctrines, he early worked out for himself, as explained in this article, what was in many respects a new system, which during the rest of his life he held without any noteworthy variation. His essential principles are already stated in a tract written in 1837, and well worth reading for its clearness and vigorous, though not faultless, reasoning—*Die Forderungen der arbeitenden Klassen*; and they are expounded again and again in his later productions, with little change even in their formulation. In order to understand his views, we must keep steadily before us his fundamental

doctrine (stated in his *Soziale Briefe an v. Kirchmann*, 1850) that all commodities cost labour and only labour—a proposition on which MARX afterwards laid much stress, but which, unless explained away by distinctions, is not true, and gives a perverted idea of the conditions of production. From this proposition Rodbertus infers that the best measure of the value of a commodity is the amount of labour which it has cost, or rather which is, on the average, necessary for its production.

Like most of the recent socialists, he has a philosophy of history of his own, which he explains in his *Untersuchungen auf dem Gebiete der National-Oekonomie des klassischen Alterthums*, and more briefly in his *Beleuchtung der sozialen Frage*, pt. ii. According to his scheme, society, after the introduction of pasture and agriculture, passes through three stages—the first the heathenish-antique, including successively the theocracy (Egypt, Peru), the caste-state (India), the satrapy (Persia), and the *Polis* (Greece and Rome); the second, or Christian-Germanic, comprehending the church state, the class-state (*Stände-staat*), the bureaucracy, and, lastly, the representative state; and the third the Christian-social, which is the organisation of the future. In the first stage the worker himself is the property of another. The second is based on property in land and capital, property in men having ceased to exist, and exchange is carried on through money and credit. In the third, land and capital will be the property of society at large; no private property but that in labour will be recognised; any one who produces anything socially useful will have a claim to the product of a labour equal to his own out of the general fund of the society.

The most serious existing social evils are, in his view, the diminution of the worker's proportional share in the products of industry—a diminution which he thinks is in process of steady increase; and the frequently recurring industrial crises by which the workers are the greatest sufferers. Both these evils he considers necessary results of the present economic system. They can be removed only by the final organisation above-mentioned, which, however, he thought it would take 500 years to introduce. But in the meantime reform was possible, especially a reform of wages. The possession of land and capital remaining as at present, the share of the wage-earner in the product of his labour must be augmented, he must be made to benefit by the increased and increasing productivity of labour, and he must be withdrawn, so far as it is possible, from the operation of the chances and changes of the market. He explains this transitional system in his essay "*Der Normalarbeitstag*" in the *Berliner Revue*, 1871. In order to divide the result of the national production equitably, that is, in the proportion of the contributions

made to it by the several workers, the performances of the latter must be reduced to a common measure. Labour in different branches of business would be compared by means of a normal time-labour-day. Using definite numbers only to fix ideas, the normal time-labour-day being one of ten hours, six hours of mining work and twelve of work in textile manufactures might be taken as equivalent to the normal ten, the amount of effort and self-sacrifice expended in those times in the different occupations named being taken to be the same. If a man, then, worked only three hours in mining or six in textile industry, he would be regarded as having worked half a normal day. But this rule would not suffice; for the product of the work done in a time-labour-day by different men in the same occupation will be different. A fair average of the actual result which might be achieved in a normal time-labour-day must be struck in each sort of work, in other words a normal work-labour-day must be fixed for each. If a miner, though working for six hours, or a weaver, though working for twelve hours, were to accomplish only half the work which ought to be produced in a full time-labour-day, he would be credited with only half-a-day of normal work-time. But not merely does Rodbertus thus reduce to a uniform mode of measurement the various divisions of labour and the different grades of industrial capacity or assiduity; he similarly regulates the amount of reward for each contribution of work. He establishes for this purpose a labour currency instead of a metallic. The product of every sort of labour being measured by normal work-time, products of equal work-time would be equal in value, and both would receive as their remuneration drafts on the common fund for an amount of commodities which was the product of the same amount of work-time. The system here explained would be the necessary regulator, not only of the final collectivist economy, but also of a capitalism carried out under the supervision of the state by private persons owning the means of production, if the distribution were to be according to services rendered, and not, as in some socialist programmes, according to the wants of individuals. If private property in the means of production existed, it would be necessary first to set aside, out of the total product, the portions to be allotted to the owners of land and the capitalists who took part in the production. The whole system would require periodical or occasional adjustment according to changes in the value-in-use of commodities and services—"otherwise supply and demand could not be held in equilibrium, and the constant free circulation of the forces of labour among the various departments of it would not be secured."

In politics, Rodbertus was national and

monarchical, because he thought that the solution of social problems could be best elaborated in a Germany united under a royal house. He kept aloof from the democratic agitations of his time. He would tolerate, he said, no movement for exciting the working classes against the executive power. In economics, as we have seen, he accepted the present order provisionally as the natural outcome of the past, though he looked for a better in the future, and would not plunge suddenly into a new industrial system having no links of connection with the present. When urged by LASSALLE to join the *Arbeiterverein*, he decidedly refused to do so, though he continued in uninterrupted correspondence with Lassalle till the death of the latter. He set aside Lassalle's no less than SCHULTZE-DE-LITZSCH's associations as supplying no adequate solution of the labour-problem, of which indeed no solution could be improvised, though a partial improvement of the workman's condition was already possible. Though he was in favour of universal suffrage, he did not approve of the policy of setting it before working men as their first object; if a political aim such as this were added to their economic demands, he thought the effect would be to lead their aspirations and efforts into wrong channels.

It has been disputed how far Rodbertus's views were original. The doctrine of the iron law of wages and of the steady decline of the workman's proportional share of the nation's industrial income, were reproductions, or perhaps exaggerations, of theories of RICARDO. And the notion of surplus value, which we find in him, had certainly been propounded previously by William THOMPSON. The idea of labour-money had been suggested before 1830; it was practically tried in the third decade of the century by Robert OWEN (see LABOUR EXCHANGE), and, after him, by PROUDHON. The question of MARX's indebtedness to Rodbertus has been keenly debated. Engels repudiates any such obligations on the part of Marx, which, nevertheless, seem to be real and even considerable. It is difficult to prove that a later author borrowed from an earlier one, because he may have independently arrived at the same conclusions; but there is no doubt that Rodbertus had previously put forward some of the views most prominent in Marx's system.

Besides the writings of Rodbertus named above, may be mentioned as of special importance his *Zur Erkenntniss unserer staatswirthschaftlichen Zustände* (1842), and his *Offener Brief an das Comité des deutschen Arbeitervereins zu Leipzig* (1863). He handled various questions which were merely occasional or of purely German interest. Thus, he gave much attention to the reform of agrarian legislation, and especially to improved arrangements for enabling agricultural proprietors to borrow on the security of their land. In the sphere of general theory, he combated the law of the diminishing productiveness of capital

applied to agriculture, and rejected the Ricardian theory of rent, substituting one of his own, which, however, seems not to have met with acceptance from any other economist.

Such of his writings as remained unpublished at his death, and could then be recovered, have been edited by Wagner and Kozak; and there have also appeared several series of his letters to Wagner (1878), to Peters (1878), to J. Zeller (1879), and to Rudolf Meyer (1882). Lassalle's letters to him have also been edited by Wagner; but his letters to Lassalle have not been found.

RODRIGUEZ DE COLMENAR. See COLMENAR, RODRIGUEZ DE.

ROEDERER, PIERRE LOUIS, Comte (1754-1835) politician and author, was born at Metz and died at Bois-Roussel (Orne).

He was a deputy to the *États-généraux* in 1789, and frequently reporter to the committee of finance.

On the 10th Fructidor, year iv. (28 August 1796), Roederer established a review, published each decade, the *Journal d'économie publique, de morale et de politique*, and thus collected round him many able contributors, as Laromiguières, Madame de Staël, Lacretelle the elder, J. F. Bourgoing, Saint Aubin, André Morellet, Benjamin Constant, Du Pont de Nemours, Arnoult, etc. At this time another review, the *Décade* of J. B. SAY, established 29th April 1794, was at the height of its prosperity. Roederer represented from the economic point of view the meeting-point between the PHYSIOCRATS and the disciples of Adam SMITH. J. B. Say belonged to the latter school. Either there was not place for two journals dealing with the same subjects or the public preferred the more slashing *Décade*, and Roederer's journal existed hardly a year (5 vols. in 8vo). When J. B. Say on entering the *Tribunat* ceased to edit the *Décade*, November 1799, Roederer, a few days later, 30 Frimaire, year viii. (21st December 1799), recommenced his review, calling it this time *Mémoires* instead of *Journal*. This new periodical, however, existed even a shorter time than the former (2 vols. 8vo), and soon this scientific journal disappeared for ever.

Roederer also edited a daily paper, the *Journal de Paris*, established 1776. He wrote many pamphlets on subjects of the day; among these it will suffice to give the name of one which appeared in 1840, entitled *Mémoires sur quelques points d'économie politique lus au Lycée en 1800 et 1801* (8vo). Roederer taught in 1800 political economy at the *Lycée*, now the *Athénée* of Paris. He was appointed in 1796 professor of political economy at the normal school (where Vandermonde had taught), but he never performed the duties.

ROESLER, KARL FRIEDRICH HERMANN (1831-1895), born in Munich, was appointed professor of the political sciences in the university of Rostock; resigned that chair in 1878, and in the following year went to Tokio as adviser on public law and commercial policy to the Japanese foreign office. In this position he is said to have exercised great influence. He died in Austria on his return from Japan.

His principal writings, besides articles in different periodicals on value, prices, income, and the international division of labour, are: *Zur Kritik der Lehre von Arbeitslohn*, 1861; *Grundsätze der Volkswirtschaftslehre*, 1864; *Ueber die Grund- lehren der von Adam Smith begründeten Volkswirtschaftstheorie*, 1867 (2nd ed. 1871); and *Vorlesungen über Volkswirtschaft*, 1878. He belonged to the historical school, and to that branch of it in particular which insists strongly on the close relations which exist between economics and jurisprudence. Roscher praised him as having pointed with special force to "the treasure of experiences and ideas on economic subjects collected by the jurists during ages, and handed down by the characteristically persistent tradition of their profession." Cossa accuses him of having fallen into gross errors in the interpretation and criticism of the fundamental doctrines of Adam Smith. Cossa does not specify these errors, but appears to refer to Rösler's opposition to the individualist principles of the liberal economists. The book *Ueber die Grundlehren*, etc., in fact, contains a searching and acute polemic not so much against Smith himself as against what the Germans call *Smithianismus*, the system of the so-called classical school. Rösler's discussion of elementary ideas and his strictures on the ordinary terminology are often sagacious and just. In his *Vorlesungen* he maintained, as necessary and desirable, the predominance of the capitalist in the regulation of industrial life, and objected to coalitions amongst the working classes, as furthering the dangerous agitation of the social-democratic party. These opinions led to a sharp attack on him by Max Hirsch in an article entitled "How one qualifies oneself for Japan."

ROGERS, JAMES EDWIN THOROLD (1823-1890). Thorold Rogers was educated at King's College, London, and at Magdalen Hall, Oxford, where he took his bachelor's degree, with a first class in *Literæ Humaniores*, in 1846. He entered holy orders in the Church of England, and took some part in the High Church movement, contributing an article to Orby Shipley's *Church and the World*. But his attention was drawn to economics by his friendship with COBDEN; and in 1862 he was elected to the Drummond professorship of political economy at Oxford.

The fruits of his professorship were the first two volumes of his monumental *History of Agriculture and Prices in England*, covering the period

1249-1400 (1866), his *Manual of Political Economy for Schools* (1868), and an edition of Adam Smith's *Wealth of Nations* (1869). Owing to academic antagonisms, however, the convocation of the university, which at that time had the right of electing to the Drummond Professorship, refused in 1868 to elect Rogers for a second term. He then turned to current politics, surrendered his clerical status, and in 1874 stood as a candidate for parliament at Scarborough. He did not succeed in securing his election till 1880, when he was chosen in the liberal interest at Southwark. He was re-elected for Bermondsey, a division of Southwark, in 1885, but he lost his seat in 1886. Meanwhile he wrote *Cobden and Public Opinion* (1873); edited the *Speeches of John Bright* (1868), the *Protests of the Lords* (1875), and Gascoigne's *Liber Veritatum* (1881); issued (1882) the third and fourth volumes of his *History of Agriculture*, covering the period 1401-1583; wrote a popular account of his conclusions concerning economic history, under the title *Six Centuries of Work and Wages* (1885); as well as a number of popular articles and booklets, of which perhaps the best is *The British Citizen* (1885). After the loss of his seat in parliament, he turned with renewed zeal to his historical researches, and was able to issue in 1887 the fifth and sixth volumes of his *History* (for the period 1584-1702), and the *First nine years of the Bank of England*. For many years he had held the almost nominal Tooke professorship of economic science at King's College, London, and he had lectured at Worcester College, Oxford; in 1888 he was re-elected to the Oxford professorship. Two courses of his professorial lectures have been printed under the titles, *The Economic Interpretation of History* (1888), and, posthumously, *The Industrial and Commercial History of England* (1892). The 7th and 8th volumes of his *History*, coming down to 1793, are being prepared chiefly from material he had collected, by one of his sons, Mr. A. G. L. Rogers.

Thorold Rogers's reputation rests on his *History of Agriculture and Prices*, which will remain an extremely valuable repository of material for economic history, however much subsequent writers may dissent from the conclusions he believed he could draw from them, and however much it may need to be supplemented by evidence of other kinds. His attitude with regard to general economic theory and economic policy remained throughout that of the MANCHESTER SCHOOL; in his earlier writings he was also greatly affected by the writings of BASTIAT. In his later years, however, he saw his way to defend trades unions; he had long ridiculed the Ricardian doctrine of rent; and in his later works he was inclined to speak of "political economists" in terms which magnified his own divergence from them.

[See an article by W. J. Ashley in the *Political Science Quarterly* (New York), iv. (1889), 381; and the notice by E. Castellet in *Nouveau Dictionnaire d'Economie politique*, Supplément.]

W. J. A.

ROHR, JULIUS BERNHARD VON (1683-1742), a protestant canon at Merseburg, displayed

from his very youth an active interest in economic questions; early in life in his thesis for his doctor's degree, he took up the subject of the advancement of economic study (*De excolendo studio economico tam principum quam privatorum*, Leipzig, 1712), and argued for the establishment of professorships of economics in the universities.

In his *Compendieuse Haushaltungs-Bibliothek*, Leipzig, 1716, Rohr also urged the foundation of state-subsidised economic societies, to which he desired to commit the supervision of economic measures of general interest; the main object of his writings, however, is the minute investigation of the means of enabling each individual to prosper in his calling. To combat the contempt with which the nobility looked down on trade and traders, he maintains that as a matter of fact noblemen trade with their cattle and corn, the learned with their writings, the soldiers with their bodily and muscular strength: trade is thus almost universal among mankind.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 378.] E. Ca.

ROLT, RICHARD (1725-70), had served in the Jacobite army in the '45, and thereafter lived in London by his pen. Besides poems, operas, and especially political pamphlets, he produced a commercial dictionary with an introduction by Samuel Johnson, 1756. The contempt expressed for this book by McCulloch in his *Commercial Dictionary*, 1832, and especially in his *Literature of Pol. Econ.*, 1845, goes too far, though the main motive of the three parties most concerned in it—Rolt, Osborne, and Johnson—was probably to make money.

The volume is a folio of between 400 and 500 unnumbered pages, preceded by a full-length frontispiece representing British commerce and maritime power, with the motto from *Æn.* v. 195, "Supernum quibus hoc, Neptune, dedisti." The title runs: "A New Dictionary of Trade and Commerce, compiled from the information of the most eminent merchants and from the works of the best writers on commercial subjects in all languages, containing among other things:—

"I. An account of the natural productions which are conducive to trade throughout the world.

"II. The different manufactures established in each particular country.

"III. Explanation of all the terms used in commerce.

"IV. Explanations of the principal terms of geography, astronomy, and navigation, so far as they are connected with trade.

"V. An exact account of the coins, weights, and measures in use throughout the world, reduced to the English standard.

"VI. A description of the established banks, trading companies, and staple commodities of different countries.

"VII. The state of the British trade, national debt, funds, customs, excise, and other taxes.

"VIII. The laws relative to trade and commerce.

"For the use of the merchants and tradesmen of Great Britain as well as of private gentlemen. By Mr. Rolt, with the assistance of several eminent merchants." (London, Osborne, etc., 1756.)

The first or editor's preface is dated 24th December 1756, and addressed to Lord High Admiral Anson; it refers to French competition and to Savary's *Dictionary* and its exaggerations of French greatness.

Boswell (*sub dato* 1761) gives Johnson's own admission of his authorship of the second preface, but says it first appeared in the 2nd edition, 1761. It

appears, however, in the 1st edition, 1756. The style is characteristic. "The writers of this volume are not so far exempt from epidemical prejudices but that they please themselves with imagining that they have reserved their labours to a propitious conjuncture, and that this is the proper time for the publication of a Dictionary of Commerce." The dictionary proposes to exhibit "the materials, the places, and the means of traffick," the means including education, especially in book-keeping and money matters. "All this he [the merchant] must learn merely as a private trader attentive to his own advantage; but, as every man ought to consider himself as part of the community to which he belongs, and, while he prosecutes his own interest, to promote likewise that of his country, it is necessary for the trader to look abroad upon mankind and study many matters which are perhaps more properly political than mercantile," such as the balance of trade, the good and evil of monopolies and companies, the state of our colonies, the duties and taxes. "To teach all this is the design of the commercial dictionary, which, though immediately and primarily written for the merchants, will be of use to every man of business or curiosity. There is no man who is not in some degree a merchant, who has not something to buy and something to sell, and who does not therefore want such instruction as may teach him the true value of possessions or commodities." "We therefore hope that we shall not repent the labour of compiling this work, nor flatter ourselves unreasonably in predicting a favourable reception to a book which no condition of life can render useless, which may contribute to the advantage of all that make or receive laws, of all that buy or sell, of all that wish to keep or improve their possessions, of all that desire to be rich, and all that desire to be wise."

The vindication of the alphabetical form of the book is worthy of the lexicographer: "Sciences [like arithmetic or geometry] in themselves systematical and coherent, are not very properly broken into such fortuitous distributions. But commerce comprised in its whole extent seems to refuse any other method of arrangement, as it comprises innumerable particulars unconnected with each other, among which there is no reason why any should be first or last, better than is furnished by the letters that compose their names." J. B.

ROMAGNOSI, GIAN DOMENICO (1761-1835). Born at Salso Maggiore, Parma; one of the most brilliant philosophers and jurists of Italy. He graduated at Parma, his first studies having been in physics and mathematics. He published in 1791 his *Genesi del diritto penale*, an important work which brought him into notice both in Italy and abroad. From 1791 to 1802 Romagnosi resided in Trent, first as a magistrate and then as a practising jurist. In 1802 he was appointed to the chair of public law at the university of Parma, in 1806 he was called by the ministers of the first kingdom of Italy to Milan, where he compiled the code of penal law. In 1807 he was made professor of civil law at the university of Pavia, and, shortly afterwards, was summoned by the government to Milan to occupy a professorship established for the improvement of higher legislation. During the latter years of Romagnosi's life he was deprived of his official appointments, reduced to live by writing for different reviews and to accept help from his devoted friends; he died in Milan.

Romagnosi's energy embraced many branches of knowledge; his numerous works, which went through several editions, bear witness to his ability. The chief are: *Genesi del diritto penale* (1791).—*Introduzione allo studio del diritto pubblico universale* (1805).—*Assunto primo della*

*scienza del diritto naturale* (1820).—*Dell' indole e dei fattori dell' incivilimento* (1832). The philosophy of Romagnosi is essentially eclectic and moderate in tone; without presenting new ideas, it gives a powerful synthesis of the political and social theories of the 18th century. Yet it is not lacking in true originality as shown by the conception of the philosophy of social life as the science of sciences and crown of knowledge; this places Romagnosi among the precursors of sociology. Germs of the present positive school of law are distinctly found in his work on the factors of civilisation as well as in his *Genesi*. Romagnosi's fundamental principle, the strictly positive method of observation he employs, the data he uses, the results he arrives at, are closely allied to the modern direction of juridical philosophy, and present a close analogy with the positivism of Herbert Spencer. Economic ideas abound in his principal works; particularly in his *Introduzione al diritto pubblico*, in his *Principii di diritto amministrativo*, in the *Assunto primo di diritto naturale*, in the *Fattori dell' incivilimento*, and more especially in the *Istituzioni di civile filosofia*, published 1839 after his death. Romagnosi wrote numerous articles on economic and statistical subjects, which appeared chiefly in the *Annali universali di statistica*, which develop more fully his economic doctrines and illustrate the relation between economics and law. These articles, written during the last and saddest years of his life, are not considered as among his best productions; they were collected in two volumes. He maintains that the material superiority of a nation can only be secured by an equal distribution of wealth; he vindicates the practical character of economic science, combating useless abstractions, and demanding that man be considered, not individually, but as a member of the social circle he lives in. Romagnosi formed an essentially historic conception of economic phenomena, studied objectively. Dogmatism in political economy, he says, is opposed to common sense—permissible, perhaps, in olden but not in modern times. He applies this idea to international trade, in which, while accepting the truth of the principle of absolute free exchange, he maintains the necessity of a reference to history, asserting that there exist social conditions under which universal competition is impossible. He examines private property in land from that standpoint, which regards it as an historical institution, changing as the social conditions change, and justified by the necessity of improving and developing the cultivation of the land to provide for an increasing population. Romagnosi's definition of political economy as the *Scienza dell' ordine sociale della ricchezza* is reproduced by Cossa and adopted by the majority of the present Italian economists. The most important points in Romagnosi's economic doctrine are those bearing on the relation between economics and law, free competition and state interference. The legal sociologist can be traced in all Romagnosi's economic writings; the liberal economist in those on judicial matters, and the experimental philosopher in both one and the other. He sees clearly the connection between economic and juridical principles, and aims at the conception of a public economic law as a guide to

social requirements. He endeavours above all things to apply his doctrines practically. Romagnosi's enlightened eclecticism inspires his ideas on competition and state interference. *La Socialità* and free competition are, according to him, essential economic conditions. The conception of egoism must be modified by that of sociology. He formed a judicial conception of individual economic liberty, demanding restrictions for the protection of individuals and of society; different restrictions, according to the progress of social development. Free competition—the more efficacious, the more equal the intelligence and the freedom of each individual—requires, according to Romagnosi, three essential conditions, social powers to be made equal, this equality protected by the law, and mutual public assistance enforced to the advantage of the weak. Finally, as for state interference, though Romagnosi combats such interference in economic and commercial matters, he is very far from advocating an absolute absence of control. He urges the necessity of the formation and maintenance of a social power, limiting individual action, thus protecting the liberty of all, and to this power he assigns the task of promoting economic, moral, and political improvement. In economic matters state interference should be regulated by social requirements, differently developed according to the conditions of place and time, stepping in where individual action is incapable of obtaining good and useful results. The best edition of the complete works of Romagnosi, of which we have quoted the principal ones, is that of Milan, 1841. His papers on economy are collected in two volumes: *Collezione degli articoli di economia politica e di statistica di G. D. R.*

[Concerning the philosophical and juridical ideas of Romagnosi, see, among many others, G. Ferrari, *La mente di G. D. Romagnosi*, Milan, 1835.—A. Pilo, "La filosofia civile di G. D. Romagnosi," Milan, 1882, in the *Filangieri* (a well-known review published in Milan).—Concerning his economic ideas, see G. Valenti, *Le idee economiche di G. D. Romagnosi*, Rome, 1891.] U. R.

ROMAN LAW has now a history extending over twenty-three centuries. It has influenced the existing law of all civilised countries, and in a modified form is actually the law in a large part of Europe. The influence it has exerted over the rights of property renders it especially deserving notice in a work dealing with economics. The history of Roman law begins with the "twelve tables," 450 B.C. Their enactments, though not actually preserved in a complete form, are known through numerous quotations and references in the works of Roman historians and lawyers. This law dealt with the two principal transactions occurring in the life of ancient Rome—the "mancipatio," the sale in solemn form in the presence of five witnesses, and the person holding the scales in which the copper coin used for payment of the purchase price was weighed; and the "nexum," the loan in solemn form. As the development

of commerce in the following centuries necessitated conveyances and contracts, not being sales or loans in the strict sense, the pontiffs, whose duty it was to act as preservers and interpreters of the law, devised new means for giving legal validity to such conveyances and contracts. This was done with the help of what was called the "interpretatio" of the law of the twelve tables. This meant something more than interpretation in the strict sense, being rather an extension of the provisions of the law by way of analogy. Thus a rule of procedure contained in the twelve tables—according to which the admission of a claim in an action was equivalent to a judgment in favour of the plaintiff—was used as a convenient method of transferring ownership in cases where there was no sale, or where the forms of the "mancipatio" were not applicable. This procedure was called "in jure cessio," and had a very striking resemblance to the "common recovery" of English law, which was used as a means for barring entails (see *ENTAIL, LAW OF*). The further progress of "interpretatio" made it possible to use the forms of "mancipatio" for a variety of purposes which had previously not been thought of. The custom arose to comply with the form of "mancipatio" by paying down a nominal sum (*mancipatio sestertii nummo uno*), by which means, in the case of a real sale, the property was made to pass before the actual purchase price was paid; and in other cases the property could be transferred by the mere fiction of a sale. The transaction called "fiducia," introduced in a similar way, has special interest to English students of legal history, as it was the prototype of "uses" and "trusts." "Fiducia" was a conveyance of the property by "mancipatio," in connection with which the transferee undertook in certain events to reconvey the property to the transferor. This method was principally used when the property was transferred by way of security for a loan, and was to be retransferred on repayment of the loan, but was also applied for other purposes (*depositum; commodatum; mandatum*).

Another agency was at work by the side of the "interpretatio," which helped to deliver Roman law from the bondage of formalism. This was the expansion of the Roman state and the intercourse of Romans with persons who, though resident within Roman territory, were excluded from the privileges of Roman citizenship. These persons were not under the rules of the civic law—"jus civile," and their transactions were governed by a sort of natural law which was called "jus gentium," because it embodied certain elements common to all the tribes who traded with Rome. This law was also applicable to certain kinds of property in which the full ownership of Roman civil law ("dominium ex jure Quiritium") was not recognised, and which, in contradistinction to things

which were transferred by "mancipatio" ("res mancipi"), were called "res nec mancipi." The former category included such things only as belong to an archaic agricultural community (land in Italy, slaves, animals used in connection with agriculture), whilst articles of trade and money belonged to the things which were transferable by mere delivery without the forms of *mancipatio*. Judicial arrangements, introduced 367 B.C., when a new office—that of the "prætor"—was created for the purpose of superintending the administration of justice, helped considerably to increase the influence of the "jus gentium" on Roman law. This was more particularly the case since the appointment, 242 B.C., of a special "prætor peregrinus" for disputes between aliens and Roman citizens, or between aliens *inter se*.

The prætor had a certain liberty in administering the law, which enabled him to relieve the persons concerned from the harshness of the letter, as in England the equitable jurisdiction of the chancellor has been employed to prevent an abuse of legal rights. The methodical spirit of the Roman nation prevented a capricious exercise of these discretionary powers, and led to the introduction of a custom according to which each prætor laid down certain rules which he intended to observe permanently during his year of office, and which he collected in an edict called "edictum perpetuum." As successive prætors acquired the habit of retaining such parts of their predecessors' edict as did not require alteration, and of adding such new matter as seemed convenient to them, the prætorian edict soon became a regular body of law, called "jus honorarium." During the last century of the republic the edicts attained a stereotyped form, and were reissued from year to year without alteration. Under Hadrian the two edicts were put together and revised by Salvius Julianus, and made binding by statute (*Senatus consultum*). Thus Roman law at the beginning of the 2nd century A.D. consisted of the "twelve tables," the customary law added to them by "interpretatio," the "jus gentium" as embodied in the "Edictum Hadrianum," and those additions to law which had been made by imperial legislation—such legislation having already at that stage assumed a certain importance.

During the following centuries the influence of the jurists was the dominant factor in the development of law. This influence was fostered by the "jus respondendi," a privilege which, since the reign of Augustus, was granted by the emperor to distinguished lawyers, and gave their opinions the same authority which in England is attributed to the decisions of the superior courts. Massurius Sabinus, a follower of C. Atejus Capito—a well-known jurist during the reign of Augustus—appears to have been the first to establish a legal school during the reign of Tiberius, and an opposing school was formed by Proculus, a disciple of Labeo (another distinguished Augustan jurist); for some time afterwards the jurists were divided into two camps, the "Sabinians" and the "Proculians" (Celsus, Salvius Julianus, and Gajus being the most

prominent authorities of that period), but the difference between the two schools disappeared in the subsequent period, of which Scaevola and Papinian, Ulpian and Paulus are the best representatives. The "jus respondendi" ceased to be conferred after the end of the 3rd century, and from that time the power of the emperors was the only influence affecting the development of law. The work of the jurists had brought about the collection of the elements previously mentioned into a systematic whole, but the emperors now gradually exerted themselves to eliminate the differences between the various elements. This was facilitated by the gradual disappearance of the distinctions between "cives" and "peregrini" and the other changes which transformed the dominion of a city into the rule of a cosmopolitan empire.

But the emperors, besides this work of unification, set themselves another task, viz. that of codification. For this purpose the old law which had been digested by various jurists had to be declared in an authoritative manner, and the new statute law had to be collected and arranged. The first task was facilitated by a statute of Theodosius and Valentinian, which selected five authors whose works were to be the only ones possessed of authority. These were:—Papinianus, Paulus, Gajus, Ulpianus, and Modestinus. They were selected because, at the time, their writings were more widely circulated than those of other writers like Scaevola, Sabinus, Julianus and Marcellus, which were not to have any authority except in so far as they were quoted by the above-mentioned authors. In cases of difference of opinion the majority was to decide, but the opinion of Papinian was to prevail over the opinion of any other single writer.

The earlier statutes of the emperors, which, like the law expounded by the jurists, were considered part of the old law, were during the 4th century brought together in two collections respectively called the Codex Gregorianus and the Codex Hermogenianus, and the later statutes which constituted the new law were, in 438 A.D., collected in the Codex Theodosianus. The statutes subsequently issued are known as the Post-Theodosian Novels.

These materials, the selected writings of the jurists, the collections of older statutes, and the Theodosian collection and Post-Theodosian Novels were in existence when Justinian undertook his great work which now forms the Corpus Juris Civilis, and in its present arrangement consists of four parts: (1) the Institutes, being an elementary summary of the law divided into four books; (2) the Digest or Pandects, being a collection of passages from authoritative authors arranged according to subjects in fifty books; of these, the forty-seventh and forty-eighth books deal with criminal law and are commonly called "libri terribiles"; (3) the Codex, which embodies the whole of the imperial statutes, and is subdivided into twelve books; (4) the Novels, being Justinian's subsequent statutes, some of which contain very material alteration of the law.

The law, as embodied in Justinian's collection, is now commonly called "Roman Law." This body of law formed the subject of study when, on the foundation of the university of Bologna (about 1100 A.D.), students from all parts of Europe came to that seat of learning. It was then that the belief formed itself that "Roman law" was a kind of universal law, and that the native law prevailing in different places only represented local deviations from universal rules. This belief was, of course, strongest in the territories forming part of the holy Roman empire, regarded by many as a continuation of imperial Rome, and this fact accounts for what is called the "reception" of Roman law, which, subject to local customs, became the common law of the countries now forming part of the German empire, Holland, Austria, and Switzerland. The increased influence which the "doctors of law," who were persons learned in Roman law, began to obtain during the 15th century in comparison to the lay judges who administered the local law, helped to bring about this result, confirmed by express enactment of the establishment of the Imperial Chamber Court in 1495 (see CAMERALISTIC SCIENCE).

The system of Roman law thus introduced into Germany and other countries did not, however, in its permanent form, remain identical with the law of Justinian; a body of law somewhat modified by the principles of canon law, local custom, and the necessities of modern commercial intercourse, was gradually

formed by the decision of the judges; and this modernised Roman law has survived in a great part of Germany, but will in 1900 be superseded by the new German civil code. The law which is now operative in other parts of Germany, in Switzerland, Austria, France, Holland, and Italy is also influenced to a great extent by the doctrines of Roman law, and Dutch-Roman law prevails in several British colonies and dependencies, e.g. the South African Colonies and Ceylon.

In England the influence of the Italian jurists was also considerable, but the fact that the English kings were national kings, and did not claim universal dominion, coupled with the circumstances that the English courts were much more centralised and better able to develop a national system of law than the courts on the continent, prevented the wholesale introduction of Roman law into this country. It is true that Roman law was, at a very early period, taught in Oxford by Vacarius and others, and that the writings of Glanville and Bracton represent the law of their time as very similar to Roman law; but their ideas did not, notwithstanding their great reputation, obtain a permanent footing. No doubt the Chancellors whose jurisdiction began to assume importance under Richard II. were influenced by certain ideas derived from Roman law—more particularly those which enabled them to draw a distinction between formal and beneficial ownership, but the equity jurisprudence which they established soon assumed a character of its own, not retaining many traces of a foreign origin. The law administered by the admiralty court and the bishops' courts, a part of which is still preserved in the practice of the probate division of the high court, was more directly influenced by the principles of Roman civil and canon law.

Owing to the long history of Roman law, it has received a vastly greater amount of attention from juridical science than any other system of law, and its study is therefore best fitted as a means for explaining the general features of law to beginners. At the same time the early stages of the development of the system, which antiquarian research, aided by the writings of the Roman jurists and historians, has reconstructed in a very complete manner, are eminently interesting to students of the progress of social and economic intercourse among men.

[The literature of Roman law is so vast that it is impossible to enumerate even the most important works. By way of general introduction, Sohm's *Institutes of Roman Law* translated by Ledlie, with an introductory essay by Erwin Grueber, will be found most useful as well as Salkowski, *Institutionen des röm. Rechts* (translated into English by Whitfield). See also Poste, *The Elements of Roman Law of Gajus*.—Moyle, *Imperatoris Justinian Institutiones Libri Quatuor*, 2 vols.—Holland and Shadwell, *Select Titles from the Digest of Justinian*. Of the books containing a full account of the system of Roman law as now practised in certain parts of Germany, Dernburg's *Pandekten*, 3 vols., is distinguished by lucidity of exposition and arrangement.

An interesting account of the early history of Roman law is to be found in Mommsen's *Roman History*. Sir Henry Maine's *Ancient Law*, and Ihering, *Der Geist des römischen Rechts*, contain most valuable and ingenious observations on the spirit of Roman law, which, however, assume some previous knowledge in the reader. As to the influence of Roman law in England, see Pollock and Maitland, *History of English Law*, i. pp. 88-114; *ib.* p. 196 *et passim*; Goudy, *An Inaugural Lecture on the Fate of the Roman Law North and South of the Tweed*.]

E. S.

ROSCHER, WILLIAM (1817-1894), was born in Hanover, where his father held a high judicial post. After he had studied history and political science at Gottingen and Berlin, he established himself in 1840 as lecturer in both these studies at the university of Gottingen, where in 1843 he was appointed professor-extraordinary of political economy, and the next year was promoted professor. In 1848 he was called to the university of Leipzig, where he died in 1894, after forty-six years' successful discharge of his professorial duties.

The importance of Roscher lies rather in the field of method than in that of dogma. He is sometimes considered as the founder in Germany of the historical method in political economy. This, however, cannot be admitted without reservation. Before him, F. LIST had already produced, on an entirely historical basis, his *Nationales System der politischen Oekonomie*, 1841, and Schmittthener, Adam MÜLLER, and even in the 18th century Justus MÖSER, had pursued similar studies. Auguste COMTE in France in his *Philosophie Positive*, which appeared between 1830 and 1842, had also claimed the historical method for the whole province of social science, even though perhaps he did not pursue it in every direction.

The numerous writings of Roscher may be divided into four groups:—

1. The historical philological writings, the earliest group, which include his dissertation for obtaining his doctor's degree, *De historicæ doctrinæ apud sophistas maiores vestigiis*, 1838, and *Lehre, Werk, und Zeitalter des Thukydides*, 1842: the projected continuation of this, which should have extended to Herodotus, Xenophon, and the Roman historians, was never written.

2. In this group we may include all the works in which he put forward his "System of Political Economy." To these there belongs first the preparatory synopsis: *Grundriss zu Vorlesungen über die Staatswirtschaft nach geschichtlicher Methode*, 1843; then, in five volumes, the expansion of this short study arranged as follows:—vol. i., *Die Grundlagen der Nationalökonomie*, 1854; vol. ii., *Die Nationalökonomie des Ackerbaues und der verwandten Urproduktionszweige*, 1859; vol. iii., *Die Nationalökonomie des Handels und Gewerbfleisses*, 1881; vol. iv., *System der Finanzwissenschaft*, 1886; vol. v., *System der Armenpflege und Armenpolitik*, 1894. The first volume by way of introduction deals with abstract or theoretical political economy. In the following volumes applied or practical economics are made the principal subject of inquiry. In the same group may be included a number of separate monographs and treatises, among which may be mentioned *Ueber den Luxus*, 1843; *Betrachtungen über Socialismus und Kommunismus*, 1845; *Ueber Korntheuerungen*, 1847; *Kolonien, Kolonialpolitik und Auswanderung*, 1856.

3. This group is composed of his numerous writings on the history of economical literature, as the essays: *Zur Geschichte der englischen Volkswirtschaftslehre im 16. und 17. Jahrhundert*, 1851-52; *Ueber die Ein- und Durchführung des Adam Smithschen Systems in Deutschland*, 1867; *Ein grosser Nationalökonom des 14. Jahrhunderts (Nicolaus Oresmius)*, 1862, and his monumental work *Geschichte der Nationalökonomie in Deutschland*, 1874.

4. The last group contains some treatises belonging to the region of politics which appeared shortly before his death, collected and enlarged under the title of *Politik, geschichtliche Naturlehre der Monarchie, Aristokratie und Demokratie*, 1892. After the death of Roscher, his son Karl

published further a collection of aphorisms written at various times, principally of a religious nature, The book is entitled *Geistliche Gedanken eines Nationalökonomens*, 1895.

Roscher calls his method the *historic* or *historico-physiological* in opposition to the *philosophic* or *idealistic* method. He contends that the object of political economy is not to point out the best possible state of things, as the system of the physiocrats would have it, and as socialism will have it at the present day, but to describe in its continuous process of development the state of things actually evolved. The best condition belongs more or less to the realm of imagination; the historical, on the contrary, is accessible to close scientific observation. Of the two principal scientific questions "what is?" and "what should be?" Roscher wishes to answer the former only. The latter can the less lead to exact results, as the "what should be" depends upon varying circumstances, and opinions about it have constantly fluctuated. If, accordingly, Roscher denies the possibility of a science on an idealistic basis, he, on the other hand, believes that by the study of what has actually occurred he can find a "firm island of scientific truth which may be accepted in the same manner as the adherents of different systems of medicine all admit the teaching of mathematical physics." Political economy in Roscher's sense would thus only "describe" and draw from historical parallels "threads of indication"—*Leitfaden*—leading up to the presumable economic movement of the future; he will neither criticise nor construct.

In the collective system of science, political economy has its place next to *politics*, of which, in a certain sense, it constitutes only a specially developed branch. If politics be denoted the science of national life, Roscher defines political economy as the science of the economic national life. Legal science is a third sister science inasmuch as legal, political, and economical science form a special group among subjects of scientific inquiry. They support each other mutually, and it is impossible to understand one of the three sides of national life with which they deal without at the same time keeping the others in view. It is a special peculiarity of the *historico-physiological* method to assist in this collective consideration.

Political economy, taken by itself, is divided, as has been already remarked, into a theoretic and a practical section. The study of the abstract or theoretical branch prepares the ground for the study of practical economics in the same way as the knowledge of anatomy prepares the ground for the study of physiology. It is concerned with "economic laws of development" which Roscher characterises as "laws of nature," not thinking, however, of mechanical but of organic nature. This is Roscher's meaning when he speaks of an "historic science of nature" dealing with politics and economics respectively.

Like the vegetable and animal world, the life of nations runs through four stages of development—childhood, youth (the time of bloom), manhood (the time of ripening), old age (the time of decay). Thus development moves in an ascending and a

descending direction. This movement is best studied by inquiring into the history of nations belonging to antiquity, because their completed career is before us.

Three principal economic factors govern the evolution of every nation; of these, one takes precedence in each successive period of life, namely, *Nature, Labour, Capital*. "In the earliest period," says Roscher, "nature still predominates throughout. In the second period, such as modern nations have lived through since the latter part of the middle ages, labour becomes ever more important. In the third, capital is predominant. . . . Usually the happiest time of nations coincides with the commencement of the third period." But this happy period does not last for ever. "At last political economy declines contemporaneously with the nation." Then gradually the peculiarities of the earlier stages of civilisation come to the front again. "Childish old age resembles the helplessness of childhood."

This historical model Roscher applies to economic conditions generally as well as to each individual department. In the childhood of every nation everything keeps within the bounds of natural economy (*Natural-wirtschaft*), or economics in kind, preceding money economics, or *Geld-wirtschaft*; it is the period of local and social restriction. Civilisation presses more and more towards freer administration of money and credit, which last exclusively governs the highest grade, the period of unrestricted competition. In the final stage, civilised life subsidises again to natural conditions. Hence it is impossible to speak in absolute terms as to the expediency of any economic institutions. "The historic method," says Roscher in the preface to his *Grundriss*, "will not simply praise or blame any economic institution; for certainly but few institutions have existed which to all people, or in all stages of civilisation, have been absolutely beneficial or absolutely detrimental. The leading-strings of the child, the crutch of the aged would be unendurable to the man." And he adds by way of illustration:—"As a rule he can only rightly judge when, where, and why, for example, perpetual charges on property, forced-labour, guild-rights, monopolistic companies should be abolished, who has fully understood why in their day they had to be introduced." It is in connection with this that Roscher, in spite of his respect for the system of Adam SMITH, yet also ascribes fitness relatively to their date to the *MERCANTILE SYSTEM* and that of the *PHYSIOCRATS*. However, he does not always remain constant to this point of view. Thus, for example, the French Bishop Nicholas ORESME (q.v.) is praised as "the greatest scholastic political economist," because even in the 14th century he argued in favour of freedom as to the rate of interest and also advanced a monetary theory "almost entirely correct according to the opinions of the 18th century." Similar praise is given to Thucydides, who lived two thousand years earlier.

Roscher, however, exaggerated the conception of economic laws of nature when he wished them to include the observation that pigs are low in price both at the lowest and the highest grade of civilisation, or when he thinks he can explain by

natural laws the reason "why hitherto steel pens have had so little success within the German customs union, sewing-needles in France, razors and scissors in Belgium."

Roscher himself is aware that with such a general theoretic basis there remains little scope for practical political economy, although, according to his opinion, it ought to form the most important part of the science. Hence he considers that he ought to warn his readers against the fatalistic inactivity which might otherwise result from the knowledge that "gegen das Alter kein Kraut gewachsen ist" (no herb is grown which can ward off old age). The *practical* statesman, he says, must always assume his people to be immortal, just as in fact every nation in this world aspires to immortality. Further, the mortality of a nation can fortunately as little be proved with certainty as that of an individual. He thinks that generally it is the statesman's part to act as physician for economic disease. "The therapeutic action of the art," thus Roscher continues, "will be profitable particularly for the following purposes: (1) to strengthen the curative powers of nature if they be too weak; (2) to moderate the impulse of nature if too violent; finally, (3) to rectify its direction if it should appear in the wrong place." From the point of view of national hygiene the period of maturity is in his opinion to be brought on as quickly as possible, and then to be retained as the stationary condition; in other words, the period of decay should be postponed as long as possible. Roscher, therefore, in no way adheres to the principle of absolute "laissez-faire et laissez-passer." On the contrary he reproaches List, for instance, with having recommended protective duties for manufacturing industry only and not for agriculture also, although the latter needs such support in a still greater degree than the former, especially in the more developed stages of civilisation; and at the same time with having undervalued the favourable effects of temporary export-duties and export-bounties.

Roscher's views of *Politics* run parallel with his economic theories. There are three constitutional types which respectively preponderate in the successive stages of historical development, viz. *Monarchy, Aristocracy, and Democracy*. This tripartite division, which was used by ancient writers, especially by ARISTOTLE, is, according to Roscher, still applicable at the present day. He places a constitutional system of government under the head of democracy, and says: "The England of the present day may be regarded as a democracy in fact, which, though moderate, is subject to but few legal restrictions." He admits another fourth form of government, which, however, is only a sub-species, and comes on with the advent of the declining period—"military tyranny," or, to follow the name of its greatest representative, Cæsarism. Cæsarism as a form of government appears when the distinction between rich and poor degenerates into a hostile contrast in social life. The proletariat is then content with that form of government which seems to offer it the most, and the possessing classes, urged by the threat of anarchy, ultimately take the same road and hand themselves over to a dictator, because, as Roscher expresses himself, "a man will rather allow body

and goods to be consumed by one lion than by ten wolves, or a hundred jackals, or a thousand rats."

Roscher explains that it is a difficult matter to decide at a given moment which of the several periods a nation has then reached, since the principal characteristics of a stage of development are manifested most clearly when the next period has already been entered on. The following are, however, according to Roscher, sure signs of a condition of decline: the growth of a brutal idea of morality; the emancipation of women; finally a marked development of socialistic and communistic currents of thought, the last especially being characteristic. As periods of universal history which have been distinguished by a powerful diffusion of socialistic and communistic ideas, the following are specially mentioned by Roscher:—

In ancient times of the periods of declining Greek character and of the degenerating Roman republic; in modern times the period preceding the final success of the Reformation; and again the present time. Roscher himself is aghast at the inevitable conclusion that we consequently stand on the threshold of the period of decline. "Terrible parallel," he exclaims. "However," he adds by way of consolation, "yet a nation never declines from the height of civilisation to which it has once attained so long as it knows how to preserve the treasures of its moral life. Also, the essential differences between our own times and those of antiquity must not be forgotten, such as the abolition of slavery, and above all the presence of Christianity, bringing in its train the means of grace which render complete moral regeneration accessible to every man."

But Roscher's views could not consistently remain on this high level. They contrast so sharply with his conceptions of a natural law involving an ever-recurrent circle of growth and decay, that a relapse is inevitable.

In another place, he considers that no nation possesses unlimited intellectual capacity. If once all the ideals of a nation be used up, it must necessarily descend to lower aims which finally bring decay with them. The development of history according to Roscher therefore leads to conclusions far from optimistic. But all this only concerns life here. In the life to come, as he repeatedly brings out in his *Geistliche Gedanken*, there is added to existence eternal growth in eternal moral perfectibility, i.e. an eternally-continued development upwards.

This metaphysical doctrine explains how Roscher admits an earthly circle of development and of decay in the case of individual nations and persons, while he holds other views as regards humanity as a whole. He derides the attempts of certain historical philosophers, especially Herder, "to draw a parallel between the periods of universal history and the age of the individual, and even with the seasons," being of opinion that so long as we do not even know whether we are in the earliest or the latest part of the history of mankind, every scheme of universal history on such lines must be a castle in the air. Darwin's theory of evolution appears to him "a philosophy of nature in the bad sense of the word"; these views also determine his attitude

towards the materialistic conception of history. According to him, MARX is "in general no close reasoner." HEGEL he admits, however, to have a great genius for history, but he thinks that on account of the "carelessness of his definitions" the perusal of his works is a bad preparation for political economists. Against CONDORCET he repeats the objections of the "great MALTEUS," and on similar grounds he opposes CAREY's opinion of the progressively increasing capacity for advance of the human race. The well-known saying of Schiller, "*Die Weltgeschichte ist das Weltgericht*," ("the history of the world is the judgment of the world"), does not receive his approval. In the sense which Schiller intended, it is, in his opinion, certainly false, since in this world bad principles usually triumph. The views of A. COMTE were practically unknown to him.

If, on the one hand, Roscher was thus independent of the whole historical aspirations of his age, on the other, he is by no means in full accord with the historical school of German political economists which was founded under the influence of his teaching. KNIES and HILDEBRAND already contradicted both his conception of the economic laws of nature and his rejection of progressive development of the whole human race. Schmoller and Brentano, though nearest to him in mode of thought, yet followed A. COMTE's theory of social evolution.

But there are differences in method as well; this is insisted on by Schmoller in his article "*Volkswirtschaft*" in the *Handwörterbuch der Staatswissenschaften* (Jena, 1895). Referring to Roscher and Hildebrand, this article says: "The older historical political economy has repeatedly desired to turn too quickly to account the lessons of universal history; we are now aware that laborious inquiries into the details of economic history can alone supply the right basis for the study of history in its economic and joint aspect." Hence modern economic science dates only from the epoch of "economic historical monographs."

These observations aim more especially at Roscher's frequently criticised passion for scraps of information which is noticeable in many parts of his works, containing numerous analogies collected together from all periods of history without any reference to their special circumstances or essential conditions.

There is further this characteristic distinction, that Roscher places the theory of political economy at the beginning of this system, to which it is to serve as introduction, while the present adherents of this historical school place it at the end, or reserve it as a matter to be left to the future development of the science.

Schmoller explicitly declares in the above-mentioned essay his doubt "whether we can and should speak at the present day of historic laws."

But in one respect Roscher stands out far above all his successors. While these almost exclusively go to historical sources, and, broadly speaking, neglect the economic literature of the past, Roscher's principal strength is shown in the opposite direction. He did not fall into the neglect of the older systems, especially of classical political economy so strikingly prominent among

later writers. Yet while Roscher was undoubtedly one of the chief founders of the historic method of enquiry on the basis of political economy, he cannot properly be reckoned among the modern historic school of German political economy; he held on his way free from their weaknesses. Nor can we omit to record the influence of his early teaching, at a time when the study of economics had dropped almost out of touch with the requirements of the time. Those who remember the quickening effect of his early lectures at Leipzig still speak with enthusiasm both of them and of his power of interesting his hearers. Roscher, besides, was a true German, scholarly in nature, a man of an honourable disposition and disinclined to any connection with clique or party.

ROSE, RIGHT HON. GEORGE (1744-1818), came of a Nairnshire family. His father was an Episcopal clergyman in Forfarshire; he was brought up by an uncle in England, and served in the navy as a boy. Afterwards he entered on an official career and held several subordinate government posts, the chief one being that of secretary to the treasury, which he filled with only a few months' interval from 1782 until 1801. He sat in parliament, for Launceston, Lymington, and Christchurch, from 1784 till his death. From 1804 to 1806 he was joint paymaster-general of the forces, and vice-president of the board of trade in Pitt's second administration; and in 1807, under the Duke of Portland, he resumed the latter office and added to it the treasurership of the navy, which he held during the remainder of his life.

Rose was in the closest relations with Pitt, throughout the latter's ministerial career, and was constantly consulted by him; his intimate knowledge of the details of trade and of finance were especially valuable to the great fiscal reformer. He was the author of several pamphlets or tracts of considerable value in their day:

*Brief Examination into the increase of the Revenue, Commerce, and Navigation of Great Britain since 1783*, published anonymously in 1793; a similar *Brief Examination . . . from 1792 to 1799*, anon. 1799; in these he emphasised

the improvements within those periods in imposition and collection of taxes, increase of revenue, better management of public debt, and the growing prosperity of the nation in spite of war expenditure; *Considerations on the debt on the Civil List*, 1802, in which the history of the civil list is sketched, and its recent administration exonerated from the accusation of waste; *Observations on the Poor Laws, and on the Management of the Poor in Great Britain*, 1805, which urged the reduction of pauperism by more systematic provision of employment for the poor, and by the better education of children, but without a thorough grasp of the facts of the case; *Observations respecting the Public Expenditure, and the influence of the Crown*, 1810, a careful explanation of the saving of 2½ millions sterling, effected by Pitt by improved management of the revenue and diminution of placemen; *Observations on Banks for Savings*, 1816; *Proposed system of Trade with Ireland explained*, 1785, a vindication of the proposals by which Pitt would have practically established free trade with Ireland.

[*Diaries and Correspondence of Right Hon. George Rose*, ed. Harcourt.—Irving's *Book of Scotsmen* (not quite accurate).—Stanhope's *Life of Pitt*.—*Gentleman's Magazine*, 1819.—Brit. Mus. Catalogue.—Parliamentary debates.]

E. G. P.

RÖSLER. See ROESLER, Karl F. H.

ROSSI, PELLEGRINO LUIGI EDOARDO (1787-1848), born at Carrara and assassinated at Rome, was one of the most distinguished economists of the century, "although," as Joseph Garnier, whose opinion is a weighty one, says, "his name is connected with no great scientific discovery, his clearness of thought, his shrewd sense, and the lucidity of his style have assisted the clear exposition of all the great principles he has dealt with, and greatly contributed to the honour in which they are held by those learned men whose duty it is to popularise them." Rossi studied in Italy, at Pavia and at Bologna, where he learnt the first elements of political economy. But Rossi owes to himself rather than to others the deep knowledge of the science which, later in life, he expounded so well. Of the moral sciences, law was the one in which he earliest distinguished himself, and laid the foundation of his brilliant career.

After being, in 1813, a short time at Geneva for the sake of his health, he returned to Italy, where his association with the policy of the chivalrous Murat almost cost him his life, or at least his liberty. He happily escaped from the reactionists, and in 1816 was again at Geneva, living in a studious retreat, which he only left in 1819 to study jurisprudence applied to Roman law. His after-success as professor of Roman history gained him his naturalisation in Switzerland (March 1820), which preceded by two months his union with the worthy companion of his life, who survived him, proud of bearing his name, and fully appreciating his

worth. At the end of 1827 he commenced to lecture on political economy, and in 1829 made a short journey to Paris, to publish there his first important book, *Traité de droit pénal*, 3 vols. 8vo. This book reached, in 1872, the fourth edition (2 vols. 8vo, with an introduction by Faustin Hélie).

The revolution of 1830 was followed in Switzerland by a proposal to revise the constitution imposed on that country in 1815. The views of Rossi seemed at one time likely to prevail. The *Pacte Rossi*, as his project was called, was at first warmly received, but the opposition of seven cantons ultimately caused it to be abandoned. Rossi was deeply moved by this failure, the more so, as it coincided in time with the loss of nearly the whole of his wife's property. Under these circumstances he accepted the offers which Guizot and the Duke of Broglie made him to fix himself in France.

J. B. SAY had been professor of political economy at the *Collège de France* from 12th March 1831, and on his death, 14th November 1832, Rossi was appointed to his chair, 14th November 1833, notwithstanding the formidable competition of Say's son-in-law, Charles COMTE. No difficulties occurred on this occasion. It was otherwise when the chair of constitutional law at the faculty of law at Paris was created, 22nd August 1834, and Rossi was appointed professor. A conspiracy appeared to have been entered into between both professors and students to protest. His first lectures were stormy, "*A la porte l'étranger*" and "*Parlez français*" resounded from all sides. How did the matter stand? Rossi had not received the French diploma of doctor of laws, and, notwithstanding his long sojourn in Switzerland, he had retained an Italian accent, which, however, did not injure the charm of his delivery. It was a year before calm was re-established. Rossi's patience wore out his opponents, and popularity succeeded the unjustified uproar. Rossi was naturalised in 1834 and adopted France as his third nationality. In 1836 he became a member of the academy of moral and political science, and Charles COMTE, though dying, was carried to the *Institut* to vote in his favour. *Lettres de grande naturalisation* permitted his promotion to the peerage in 1839, and in March 1845 he was appointed ambassador of France at Rome. All these honours were heaped on him without any initiative on his part.

During this time he had founded at Paris, in February 1842, the first society of political economy; this, however, gradually melted away—member after member—into another society formed by Guillaumin, Garnier, etc., bearing the same name, over the learned discussions of which Rossi presided until his departure for Rome, so fatal to him.

The revolution of 1848 broke his connection

with France, and he became semi-official councillor to Pius IX., elected pope in 1846, who at that time showed himself favourable to liberal reforms, and with the assistance of Rossi endeavoured to introduce parliamentary government in the pontifical states. If this movement had even been possible, a more resolute and judicious mind would have been needed to lead it than that of the then successor of Gregory XVI. Rossi's terrible murder, perpetrated under the eyes of an armed force, inactive, if not accomplices, amid the indifference of the official world, was the signal for a revolution which gave birth to an ephemeral republic.

Rossi was an able thinker, but caution appears to have restrained him within over narrow limits. The fear of introducing too radical reforms sometimes appears to have paralyzed his mind. Thus he supported the artificial monopolies of the stock brokers (see *CHANGE, AGENTS DE*), of the attorneys, and of the Bank of France, and was indulgent to the treatment of sugar (see *BOUNTIES ON SUGAR*), utterly opposed as this was to sound economic principle. It is deeply to be regretted that politics drew Rossi thus aside from the true path. His great logical power might have contributed to establish political economy on the authoritative basis justly taken by the natural and mathematical sciences. But after all, these are but exceptional blemishes in his work. The separation of pure political economy from applied political economy, the rent of land, commercial liberty, immaterial products, freedom of labour, the teaching and the popular teaching of economic science; above all, the principle of population, on which subject he wrote an introduction in the style of a master for the French edition of the masterpiece of MALTHUS, all furnished Rossi with subject matter for pages sound in thought and brilliant in style. It is to be noticed that the moment Rossi forgets politics his courage never fails him. "It would be a strange idea," he said in one of his lectures, "what the effect would be if the claim were admitted that there is no right to pass from slavery to liberty, from injustice to justice, from barbarism to civilisation, unless the transition could be made without any disturbance, without even a shade of inconvenience. Were this doctrine supreme, the world would still be plunged in the most terrible barbarism." The moment Rossi is clear from the trammels of government, he is the absolute and unshackled advocate of liberty. "Liberty is the one guarantee which nothing replaces, it alone opens to the producer a wide and noble career, it alone procures for the consumer abundance and cheapness; let us add that it favours the fulfilment of law and morality."

Of the works by Rossi which remain, the first two volumes of his *Cours d'économie politique* were

published (1st ed. 1840-41; 2nd ed. 1840) and revised and corrected by him. His occupations, his death, prevented him from doing the same for the rest of his works, but his pupil and friend, A. Porée, *chef de bureau* in the department of public works, had taken down in shorthand and collected the lectures of his master, at least those of 1834 and 1838. His industry enabled Rossi's son to publish, in 1851 and 1854, the 2 vols. following those mentioned above. The whole 4 vols., several times reprinted, attained, in 1887, their fifth edition. *Le Cours de droit constitutionnel* did not appear till 1866-67. This book is also due to the shorthand notes of Rossi's painstaking pupil, Porée. The second and last edition appeared in 1877; this has an introduction by the learned Italian juriconsult, C. Boncompagni. Finally, the miscellaneous works, unpublished or scattered, were collected in 2 vols., one devoted to political economy, the other to history and philosophy, which appeared in 1857 under the title of *Mélanges d'économie politique, d'histoire et de philosophie* (2 vols. 8vo).

The memory of Rossi has been honoured in many ways, and his widow left the *Institut* of France a sum of 100,000 francs (£4000), the interest of which provides scholarships in economy or law.

[Mignet read the *Éloge* of Rossi at the *Institut de France*, 1849. Finally, the Economic society of which he was the first president, celebrated, 1887, the centenary of his birth with a notice of his life and works by the permanent secretary, M. Alph. Courtois. Let us add that M. le Comte Fleury d'Ideville has immortalised him in a large volume entitled *Le Comte Pellegrino Rossi, sa vie, ses œuvres, sa mort*, 1887, more historical, however, than economic. On 30th September 1876 Carrara erected a statue in his memory.]

A. C. F.

ROTA, PIETRO (1846-1875), was born at Bergamo and died at Genoa. He was for some time professor of social economy at the university of Genoa. Rota has left two admirable works on banking—a history of banks, and a volume on the principles of the science of banking. These works, though somewhat out of date now, were of importance when they appeared.

*Storia delle banche*, Milan, 1874.—*Principii di scienza bancaria*, 3rd edition, Milan, 1885.

U. R.

ROTURIER. In France, every man not belonging to the *noblesse* was called a *roturier*. This word is generally supposed to be derived from *rupturarius*—he who breaks or clears the soil; still it was applied to the burgher as well as to the peasant. The latter were especially designated by the word *manant*, he who remains on, or is tied to the land. A holding *en roture* was a tenure at a perpetual fixed rent.

E. CA.

ROUBAUD, PIERRE JOSEPH ANDRÉ, Abbé (1730-1791), born at Avignon, died in Paris, where he had lived since he was twenty. He early allied himself with the *ECONOMISTES* of

the school of Quesnay, to whose doctrines he constantly adhered. He worked principally as a journalist. In conjunction with Le Camus he edited the *Journal du Commerce*, from 1759 to 1762; in January 1765 he took part in editing the *Journal de l'Agriculture, du Commerce et des Finances*, his chief being DU PONT DE NEMOURS.

When Du Pont resigned in 1779, Roubaud and d'Ameilhon edited this periodical, which was then entitled the *Journal de l'Agriculture, du Commerce, des Arts, et des Finances*; it ceased in 1783.

Up to 1772 QUESNAY and the elder MIRA-BEAU had contributed to the paper. Roubaud's attacks against the despotic system of the government led to his exile and BAUDEAU's by Maurepas in 1775. The next year both were recalled by NECKER.

Besides his work for the journals quoted above, Roubaud wrote many pamphlets on the controversies between the *PHYSIOCRATS* and their antagonists, Voltaire, Galiani, Morellet, etc.

A. C. F.

ROUBLE. Russian silver coin of 100 kopecks. From 1839, when the currency of Russia was reorganised, and payments in silver were resumed, to 1886, the rouble was of the weight of 319.9 grains, and of the millesimal fineness of 868. In the latter year the fineness was altered to 900, and the weight diminished sufficiently for the coin to retain its intrinsic value, the rouble now weighing 308.5 grains. Its value in sterling silver at 2s. 3d. per oz. is 2s. 1.37d.; and in silver francs, 900 fine, 2.666 francs.

ROUNDSMAN. Before the passing of the Poor Law Amendment Act 1834, outdoor relief was practically unlimited. Every person applying for relief obtained an allowance from the parish according to a scale varying with the number of his family and the price of bread. Different expedients were tried to lessen the heavy burthen thus laid on the ratepayers by employing the persons in receipt of relief. One of these expedients was known as the "roundsman system." The parish paid occupiers of land to employ applicants for relief at the rate of wages fixed by the parish. The difference between the parish allowance and the sum which the employer was willing to pay for the pauper's labour was made good out of the poor-rate. What employers were willing to pay was in many places determined by putting up the paupers to a sort of auction. An able-bodied pauper might fetch 5s. a week; an infirm one 1s. 6d. to 3s.; but the exact figure would depend on local conditions. The roundsman system worked badly. Like the other methods of outdoor relief then in use, it tempted the able-bodied labourer to come on the parish; it kept down wages and made them independent of efficiency, and enabled

the employer to defray part of his wages bill out of the rates. It was condemned in the report of the poor-law commission, and became obsolete through the changes made by the Poor Law Amendment Act 1834. The name of "roundsman" was given to the paupers thus relieved because they went round from one farmhouse to another seeking for work.

[*Report of the Poor Law Commissioners, 1834.*—Eden, *State of the Poor.*—Nicholls, *History of the English Poor Law.*—Fowle, *The Poor Law* (English Citizen Series).] F. C. M.

ROUSSEAU, JEAN JACQUES (1712-78), wrote not as an economist, but as a political reformer. In so far therefore as he contributed to, and influenced, economic thought, it was chiefly due to the fact that in his day political economy was not differentiated from political philosophy. Those through whose labours this differentiation was then actually being begun, viz. CANTILLON, the PHYSIOCRATS, VERRI, STEUART, etc., were not forwarded in the work of specialisation by anything that Rousseau wrote. His one production purporting to be on the subject of political economy (1755)—the article so entitled in the *Encyclopédie*—is wholly occupied with a partial statement of his doctrine of politics, namely of the nature, object, and functions of government. In connection, however, with the last of these three points, it was inevitable that he should deal with matter of economic interest, and this is so not only in this article but in many of his writings. *L'ami de l'égalité*, as he dubbed himself to MIRABEAU, Rousseau in all his works that have a political bearing has for keynote the evil of inequality. This he struck in the discourse on the moral influence of art and science (1750), which first made him famous, developed in the discourse on the origin of inequality (1754), and made the real theme—more so than liberty—of the *Contrat Social* (1762); (see SOCIAL CONTRACT). From inequality came riches, thence luxury and idleness; and the social state, based on its primary, if tacit and unwritten, pact, has no other justification except the object of substituting moral and legal equality for the inequalities imposed by nature and the injustice resulting therefrom. Bad government fosters inequality, keeping the poor in poverty and protecting the rich in usurpation, giving only to him that hath ("Disc. on Art," etc., *Réponse au Roi de Pologne, C.S., I. ix.*). Hence Rousseau could not fail to be much occupied with the subject of distribution of wealth, whether in relation to the functions of government, the maintenance of government, the increase of population, or the tenure of land. Whatever he wrote on these, as on other subjects, was widely read, and, owing to qualities in the spirit and style of the writer as well as to the con-

juncture of social and political conditions of his time, had an extraordinary influence. Over and above the explicit adherence to his doctrines professed by some of the leading spirits in the French revolution, as well as the corresponding anti-Rousseauism in English thinkers, such as Adam Smith, Burke, etc., the origin of the physiocratic school seems to Professor Gide (*Economic Journal*, June 1897) to be best accounted for as a protest against the politico-economic doctrines of Rousseau. Whether this be or be not a tenable hypothesis, it cannot be correct to class Rousseau as a follower of the physiocrats, as is done in Kautz's economic history. All Rousseau's works were published before any distinctively physiocratic work appeared, excepting the *Tableau Économique* of QUESNAY, which preceded Rousseau's latest writings, the *Contrat Social* and *Émile*, by four years. Mirabeau, acting apparently on behalf of his set, sent Rousseau MERCIER DE LA RIVIERE's *Ordre Naturel* (1767), and on receiving the former's criticisms of the extreme optimism of the book, and of the *système économique* in general, wrote a long reply endeavouring to convert Rousseau to "our" doctrine of property, population, liberty, and generally the essential laws of natural order. Rousseau's work, however, was done, and he only begged for affection, and no further worry. He could not bring himself to finish the *Philosophie Rurale*.

More plausible is the position claimed for him by Baudrillart, RAE, etc., as one of the fathers of modern socialism. It was his fearless speculations, inspired by HOBBS and especially LOCKE, not to mention the utopians of the two preceding centuries, that led directly up to issues for which the physiocrats, with their co-proprietorship of the sovereign in the soil, and their *impôt unique*, did but indirectly prepare the way (cp. Gide, *loc. cit.*). No one so forcibly as Rousseau had *socialised* the status of the individual, *democratised* the sphere of the sovereign power, and *emphasised* the notion of national property in land. Further, his hatred of inequality, together with his disbelief in the beneficent tendencies of the unregulated play of private interest, led him to utter opinions as to the equalisation of wealth which found an echo in all socialistic literature. The wage question had not then been forced to the front by industrial developments. Nor is there any very definite quarrel with capital in the crutch and ladder passage in the *Inégalité* discourse alluded to by ROSCHER (*Pol. Econ.*, lxii.), nor with competition in the preface to *Narcisse* quoted by Baudrillart. Neither does he, any more than the physiocrats, champion the cause of the peasant against the *cultivateur*. But, his general theme being to denounce moral or political inequality, i.e. "the enjoyment by some of the privileges of wealth, honour, power, rule, to the prejudice

of others," so that we see "the child ruling the old man, the idiot directing the wise, and a handful crammed with superfluities while the starved multitude lacks necessities" (*Disc. sur . . . l'Inégalité*), his ideal economy was a state where there was "no fear nor need of any one, self-sufficing" . . . (*Sur le Gouvernement de la Pologne*, ch. xi.), in which "no citizen should be rich enough to be able to buy another, and none poor enough to be forced to sell himself" (*C.S.*, ii. 11). To bring this about, a state should give itself to agriculture, multiplying useful commodities and consumers as much as possible (success in compassing the latter without immigration being the hall-mark of a good government, *C.S.*, iii. 9), attend little to commerce, and condemn money, which is but the sign of wealth, and a shifting standard of value as compared with such commodities as are constants in utility (*Gouvernement de la Pologne*, xi.). To maintain such a public economy, government, as "one of its most important functions," should prevent (*prévenir*) extreme inequality of wealth, not by confiscating that of the rich, filling barns, or exempting from work, but by withholding the power of accumulating wealth; not by building almshouses (*hospitales*) for the poor, but in guaranteeing citizens against poverty. For instance, it should regulate the distribution of population, foster useful arts, stimulate agriculture, check luxury, abolish the tax-farmer, tax men's arms (*bras*) rather than their purses, commutation being more servile than CORVÉE, levy a proportional tax (not *unique*) on land, without any exemption, or, as this would involve a cadastral survey, on produce (*net* is not mentioned) by tithe or commutation, administer public education, and intervene generally where private interest brought the individual will out of harmony with the general will, or left it indifferent to the common good (*Econ. Pol.*). Better than any money contributions to carry on the expenses of government and justice was the plan of a "public domain" (*op. cit.*), as had been advocated by BODIN *q.v.* Finally, to ensure political stability and executive efficiency, "the right which every individual has over his own property [in land] is always subordinate to the right which the community has over all" (*C.S.*, i. 9)—so runs Rousseau's view of what the physiocrats termed the *co-propriété du souverain*.

Comparison with the expositions given under the head of physiocracy and socialism, as well as with that under mercantilism (see THE PHYSIOCRATS; SOCIALISM; MERCANTILE SYSTEM), will bring out how far, in these few indications, Rousseau appears as an innovator. On the last-named phase of economic thought, with its traditions of commerce, money, and international aggressiveness, he may fairly be said to have turned his back,

excepting in his general antipathy to *laissez faire*. Apart from his disbelief in this and in "legal despotism," he was economically more in accord with that *système économique* that was taking form while he yet wrote. His thought, that "the introduction of the superfluous makes indispensable the division and distribution of labour" (*Emile*, iii.; *cp. C.S.*, iii. viii.), is closely followed by Turgot. And the latter starts his *Réflexions* with an allusion to a social "state of nature" as admittedly hypothetical as was Rousseau's (*cp. Disc. Inégalité*). The pictorial genius and style of Rousseau lent to the setting forth of his own hypothesis an appearance of location in time and space beyond what he himself intended. He insisted to Mirabeau that "natural and political laws" were only true in the abstract, and, himself ever concerned with practical philosophy, deprecates the attempts of historical writers to establish what ought to be by what has been (*le droit par le fait*, *C.S.*, ch. i. 2). If, as some have said, he is known less by the real gist of his works than by his most forcible phrases, this is not seldom the fate of those in whom, as in Rousseau, "did lie prophetic meaning such as none of the others show" (Carlyle).

[*Œuvres*, ed. Auguis, 1825.—*Dict. de l'Éc. Pol.*, Coquelin et Guillaumin.—Baudrillard, art. "Rousseau."—Rae, *Contemporary Socialism*.—Levallois, *Rousseau, ses amis, etc., Correspondance: "Mirabeau to Rousseau."*—Bonar, *Philosophy and Political Economy*, p. 134.]

ROUTES, COMMERCIAL. See COMMERCIAL ROUTES (History of).

ROYALTY. Royalties, regalia, or jura regalia formerly meant those royal rights which could not be granted away with any piece of land except by being specially mentioned in the grant or charter by which the land was given. The most important of these were royal mines, wreck of the sea, and royal fish. In modern times the word "royalties" has acquired another meaning, being used in one of these senses—the money paid by the publisher of copyright books to the owner of the copyright; the money paid by the maker of patented articles by way of license to the patentee; the money paid to the owners of mines for the right of working them.

A. E. S.

ROYER, CHARLES ÉDOUARD (1810-1847). A gardener in his youth, Royer, after a severe competitive examination, which he passed with great success, was, at the early age of twenty-eight, appointed to the chair of rural economy in the school of agriculture at Grignon.

Royer was sent by the French government to study the organisation of German Landbanks (the CRÉDIT FONCIER of France was not founded till 1852), and although he was quite aware that the object of these institutions primarily was political—to uphold German noble families—he pointed out the services which they might render to agriculture;

but he remained very doubtful about the usefulness of the *crédit agricole* to farmers who were not owners of land, and preferred greatly the extension of peasant proprietorship. His report was printed by official authority under the title of *Des Institutions de Crédit foncier en Belgique et en Allemagne* (Paris, 1845).

Royer previously had written a treatise on agricultural bookkeeping (*Traité de comptabilité agricole*, 1840), and a book on French agriculture (*De l'administration des richesses et de la statistique agricoles de la France*, 1843), which good judges still consider worth reading.

[See article on Royer in the *Nouveau Dictionnaire d'Économie Politique.*] E. ca.

RUDING, REV. ROGERS, B.D. (1751-1820), came of a Leicestershire family (originally derived from Worrestershire), was educated at Merton College, Oxford, of which he became a fellow, and in 1793 was presented by his college to the vicarage of Maldon and Chessington, which he held until his death.

He published in 1798 a *Proposal for restoring the ancient constitution of the Mint, so far as relates to the expense of Coinage; together with the outline of a plan for the improvement of the money, and for increasing the difficulty of counterfeiting*. "Written to recommend the imposition of a seignorage on the coin." M'Culloch, *Lit. of Pol. Econ.*, p. 167. He contributed articles to the *Gentleman's Magazine*; and to the *Archæologia* "Some account of the trial of the Pix" (vol. xvii.), and a "Memoir of the office of Cuneator" (vol. xviii.). His chief work was *Annals of the Coinage of Great Britain and its dependencies*, 1817-19, a full and scholarly history of English coinage from earliest times, illustrated with numerous plates; it is still the standard work on the subject. His object was not scientific only, but economic; to point out defects in the coinage laws, and to indicate the true remedies, with a view to diminish the temptation to tamper with the currency.

[Nichols, *Hist. and Antiquities of the County of Leicester*, vol. iv. pp. 568, 569.—*Harleian Soc. Publ.*, vol. ii.—Brayley and Britton's *Hist. of Surrey*, iii. 164.—*Gentleman's Magazine*, vol. 90, pt. i. 1820.] E. G. P.

RUGE, ARNOLD (1802-1880), studied philosophy at Halle, Jena, and Heidelberg. Carried away by the views of HEGEL, whom he read for the first time in 1833, he began in 1837 to contribute to the *Hallische Jahrbücher* that he might "infuse the Hegelian philosophy into the life of the state." This publication appeared from 1841 onwards under Ruge's sole direction, with the title of *Deutsche Jahrbücher*, but it was suppressed in 1843. This led to Ruge's departure for Paris, where, in connection with MARX (*q.v.*), he started the short-lived *Deutsch-Französische Jahrbücher*. In 1848 Ruge was elected representative of the town of Breslau in the Frankfort parliament, and he became the editor of the democratic newspaper *Die Reform*, destined to be the organ of the radical party, shortly afterwards

suppressed during the political reaction. Ruge then settled down in Brighton (1850), where he resided to the time of his death.

Though a friend of Marx and BAKOUNIN, his democratic views, like that of his other friend Mazzini, never merged into COMMUNISM.

His literary activity was very great. He translated into German the *Letters of Junius* (1847); Buckle's *History of Civilisation* (1875); Lewes's *History of Philosophy* (1871); and adapted Lytton's *Life of Palmerston* (1872). On his own account, he wrote many volumes and pamphlets, amongst which may be mentioned here—*Unser System* (1850).—*Revolutionsmodelle* (1850).—*Die drei Völker und die Legitimität* (1860).—*Was wir brauchen* (1861).—*Acht Reden über Religion, ihr Entstehen und ihr Vergehen* (1869).

[*Allgemeine Deutsche Biographie.*] E. ca.

RUGGLES, THOMAS (1745-1813), barrister, deputy-lieutenant and J.P. for Essex and Suffolk. He was an honorary member of the board of agriculture. For his friend Arthur YOUNG he wrote in the *Annals of Agriculture* (1784-1815) letters on the "History of the Poor." He advocated schools of industry, with a view to training children to industrious habits and thus preventing pauperism. The success of some of these schools and of the Sunday school movement seemed to warrant the application of the act for the relief of the poor, 43 Eliz. c. 2, § 1, to this object. The children were employed in spinning and knitting, and were paid about 4d. a day. He was called into consultation by Pitt, when he was preparing his "Bill for the better support and maintenance of the poor," 1796, and clauses on this point were inserted in it (cp. as to these schools, Sir F. M. Eden's *History of the Poor*, 1797, vol. i., and Mrs. Trimmer's *The Economy of Charity*, 1801, vol. i. p. 193, and appendices). Ruggles is also a chief witness in regard to the houses of industry in Norfolk (see WORKHOUSE), established 1757-1792. He shared the view entertained by Adam Smith and others of the economic evil of the old law of settlement; but he did not appreciate (*e.g.*) the evil of an allowance in maintenance of "supernumerary children" as proposed in Pitt's Bill (cp. Sir George Nicholl's *History of the English Poor Law*, 1854, vol. ii. p. 125, and Eden) or of a system of public employment for the poor (see TOWNSEND). He gives an interesting sketch of means adopted to meet the distress of 1795-96 (cp. *Origin of the Allowance system in Berkshire* (1795); report by Richard Hall, 1st A. Rep. Poor Law Commissioners, 1835, p. 207). His writings are:—

*The Barrister, or Strictures on the education proper for the Bar*, London, 1st ed. 1792; 2nd ed. 1818.—*The History of the Poor; their rights, duties, and the laws respecting them*, London, 1st ed. 1793; 2nd, 1797 (see UNION; POOR LAW).

U. S. L.

RÜMELIN, GUSTAV VON (1815-1889), represented a district of his native Würtemberg in the German parliament of 1848, where he was an active member of the party which advocated the exclusion of Austria from the German confederation. He afterwards entered the ministry of public instruction and religion of Würtemberg, and became, in 1867, lecturer on statistics and philosophy in the university of Tübingen, of which university he was elected chancellor in 1879.

His best-known work, *Reden und Aufsätze*, 3 vols. 1875-1894, consists mainly of his addresses as rector. Rümelin was also for a long time at the head of the statistical office of Würtemberg. Statistics were always one of his favourite studies, though he also devoted himself to philosophy, philology, and literary criticism.

His width of view appears in his treatment of statistical problems; he is always anxious to show that statistics should be read in the light of existing social and moral conditions and tendencies. He does not admit that the investigation of the latter properly belongs to the sphere of statistical science, which he defines as "an auxiliary science having for its object the discovery of the character of human communities by means of the methodical (numerical) observation and calculation of similar phenomena," taking the word *communities* in its widest sense; in opposition to other German statisticians, he desires to hand over to the science of DEMOGRAPHY the descriptive or graphical part of statistics. In his *Geschichte der Nat.-Oekonomie*, p. 1011, Roscher contested the soundness of these views, pointing out that statistics would thus be degraded from the rank of a science to that of a mere method. This debate arose from the ambiguous sense of the German word *Staatskunde*.

The theories of MALTHUS on population attracted the attention of Rümelin over and over again, and though he readily admits that Malthus has perhaps not taken sufficient account of some prudential and social checks, which in themselves are neither moral nor immoral, he accepts in fact his main position; according to Rümelin, a constant struggle goes on between hunger and what he calls "the demoniac power" of sexual instinct. Frightened at the rapid increase of the German population after the war of 1870-71, he openly states in his *Aufsatz* on over-population (1881) that "it is the intelligent instinct of the French masses which has turned them into unconscious Malthusians. Christian and civic morality do not consist in unchangeable injunctions. . . . There have been times, which will recur, when fecundity was a social want and a social blessing; at other times, limitation and continence are a duty, and such is at present the case in Germany. . . . The present French system is the spontaneous outcome of intelligent reflection." The same assertions were repeated by Rümelin in his article on the theory of population (*Bevölkerungslehre*) in Schönberg's *Handbuch der politischen Oekonomie* (vol. i., 3rd ed. 1890).

Rümelin, as a writer, is a brilliant and thoughtful essayist, eager to avoid trenchant dogmatism, anxious also to consider all the aspects of social problems. Besides his above-mentioned *Reden*

und *Aufsätze*, he was a frequent contributor to German periodicals and collective works on moral, philosophical, and statistical topics. Ten of the *Reden und Aufsätze* were translated into French, under the title of *Problèmes d'Economie et de Statistique* (Paris, 1896). E. ca.

RUNDALÉ was an ancient tenure of land in Ireland and the Scotch Highlands, under which the property of one owner was scattered in detached pieces about the estate of his tribe or clan. *Runrig* and *Changedale* were two variations of this system. Under the former the land was so divided that alternate "rigs" or strips belonged to the same owner; under the latter the portions of the common estate allotted to individuals were periodically changed amongst the members of the partnership.

The system springs from the days of collective ownership or occupation, when all the lands of a village belonged to all its inhabitants, and each individual had a right, not to a particular piece for ever, but to the use of a share in the common property for a certain time. Either to insure a just division of the land, when mensuration and arithmetic were classed with the black arts, or to prevent one man securing all the best lands, it was customary to give each man his share in every acre as it was ploughed up, or dividing the land into three classes according to their fertility, to assign a portion to individuals in each of them. The rundale tenure may be compared with the system in vogue amongst the Anglo-Saxons, before the introduction of INTENSIVE CULTIVATION, and to the customs of the early Welsh. As a rule it was only the arable fields and meadows that were treated in this way; the pasture and waste of the community were held in common. Arthur Young found the rundale and changedale systems exceedingly widespread throughout Ireland. As a rule a farm of 100 acres would be held by four or five families. The holdings were only separated by balks of grass, and as a consequence all the evils of the English "open field" culture were prevalent. In Ireland the system seems to have hardly died out yet. In the Scotch Highlands much the same tenure existed, and though by the statute of 1695, c. 23, any one partner was enabled to force a division of the lands, it seems to have lasted until fifty years ago. L. R. H.

RUPEE, HISTORY OF. The silver coin which is the standard money of India under British government can be traced back to the primitive system under which the precious metals passed as money by weight. The present rupee was inherited by the government from the East India Company, whose rupee was developed out of the many varying types of coin under that name issued by the native rulers whom the company displaced; and the original of these many types was the coined

embodiment of the standard weight of silver according to the earlier monetary system.

The unit of the system of weights was the *rati*, the seed of the *Abrus precatorius*, equivalent to 1.75 grains troy. The multiple of 100 *ratis* gave its weight (176 grains) to the first rupee of Sher Shah (1542). The numerous dynasties and petty states followed, each with its own coinage, and soon there was a multitude of rupees in local circulation of varying degrees of weight and fineness. The middle of the 18th century saw the company's territory largely extended, and its status definitely changed from that of a trading association to that of a governing power. One of the perplexing problems of the period was the confused condition of the currency. The different coins of gold and silver circulating in the bazaars were estimated to number not far short of a thousand, and of these the varieties of the rupee formed no inconsiderable part. The termination of the company's rule was already approaching before it succeeded in reducing this chaos to complete order by the establishment of one uniform rupee, but, in the meantime, in each of the three presidencies one particular type assumed predominance.

In *Bengal* the leading type was the *Sicca* rupee, deriving its name from the Arabic word for a coining-die. Its normal weight was nearly 180 grains, and its content of fine silver 176 grains. Among the currency troubles with which the Indian peasant was beset, not least was the money-changers' practice of charging discount on these coins according to the period for which they had been in circulation. To frustrate this device it was ordered in 1771 that rupees of the earlier years of the reign of Shah Alam, the last of the Moguls, should be rated equally with those of his nineteenth year, and that future issues should bear that year's date. Consequently the *Sicca* rupees, from 1773 onwards, were stamped as having been struck in the nineteenth year of Shah Alam. The coinage of the *Sicca* rupee continued until 1836, when it ceased on the introduction of the company's rupee.

In *Bombay* the *Surat* rupee predominated. The first English rupee had been struck in Bombay as far back as 1677. But the rupee of British manufacture, weighing rather less than the *Sicca* rupee, though containing a fraction more of fine silver, could not hold its own against the competition of the *Surat* rupee, a native coin of nominal equivalence, but of less intrinsic value. Its coinage ceased altogether for twenty years up to the close of the last century. In 1801 a new rupee was ordered to be struck for Bombay, its weight and fineness being almost identical with those of the present coin. In 1824 the *Madras* standard was adopted for Bombay.

In *Madras* several varieties of the *Arcot* rupee were current. Those coined at the Fort St. George Mint contained 166.477 grains of fine silver, and were styled "*Madras Arcot rupees*," as distinguished from other *Arcot* rupees of native manufacture. But for various reasons, prior to 1818, the silver rupee was not the effective standard in *Madras*, being over-ridden by the gold *pagoda* and by a nominally subordinate silver coin, the *ANNA*.

In 1806 the company gave directions for the issue of a new rupee as the standard coin of *Madras*, to weigh 180 grains gross, and contain 165 grains of fine silver. It was not, however, until 1818 that currency was given by proclamation to the new standard coin.

The order given by the company in 1806 for the issue of a standard rupee in *Madras* was the first-fruits of the intention they had then formed to put an end to the inconveniences arising out of the existing diversity of moneys by establishing "one general system for the formation of the coin for the currency of the whole of our possessions on the continent of Asia." A generation elapsed before that intention was fulfilled. One fundamental decision reached at this time was that the future currency system should be based upon a silver standard. In earlier years the company had made several attempts to relieve currency difficulties by fixing the relative values of gold and silver as legal tender within their dominions. In 1806, convinced by the arguments in Lord Liverpool's famous letter, they adopted the view that one metal should be the standard, and that for India that metal should be silver. In 1817 the directors repeated this assertion, with the addition that no ratio should be fixed between the standard silver coin and the gold coin. Finally, in 1835, the Indian Act No. XIII. instituted one uniform silver rupee as the standard coin of British India. This rupee followed the type of the *Madras* rupee of 1818, having a gross weight of 180 grains and a fine silver content of 165 grains, or  $\frac{11}{16}$  fine. No change has since been made in the weight or fineness of the coin; but in 1862, as a consequence of the transfer of the government to the crown, the queen's effigy was introduced into the design in place of the company's arms, and the name of the coin altered from "company's rupee" to "government rupee."

The fall in the gold price of silver, which began in the early 'seventies, and continued almost unchecked for the next twenty years, caused constant and increasing anxiety to the Indian government, as well as to the commercial interests in the country. The difficulties entailed upon the government admitted of no question. India having yearly to remit a large sum to this country in discharge of her gold obligations, every step in the fall of the exchange meant an increase in the number of rupees required to effect that purpose. The variations were sufficient to render any trustworthy budget estimate impossible; and the growing demands on the revenue, coupled with the limited resources of taxation, led at length to a position of affairs in which the authorities could not contemplate without dismay the prospect of a further fall. An additional cause of uneasiness to the government was the distress occasioned by the fall of silver to the many officers of the public service, who were under the necessity of remitting part of their rupee salaries to their families in England. It is impossible to speak with equal certainty as to the effects on the people and commerce of India. How far the fluctuations of exchange have operated to harass trade and to check investments in India has been much debated. But the representatives of the trading community were among the first and the most importunate in pressing upon the government the necessity for action. In 1876 memorials were addressed to the governor-general by the Bengal chamber of commerce and the Calcutta trades' association, urging a temporary suspension of the unlimited coinage of silver by the mints. The Indian government, while unable to agree that existing circumstances called for such a remedy, took the opportunity to represent to the secretary of state the necessity of being prepared for prompt measures, even to the extent of the transition to a gold

standard, in the event of France deciding to demonetise her silver legal tender money. This particular danger passed away, but the fall in silver continued, varied by occasional oscillations even more disconcerting than the steady fall. The gold value of the rupee, which averaged 2½ 120d. in the year 1871-72, before the commencement of the disturbance, had fallen to an average of 16·733d. in the year 1891-92. In June 1892 the Indian government, under stress of an apprehension that the United States might any day be driven to abandon her attempt to keep up the price of silver by her purchases of that metal, expressed to the home authorities their deliberate opinion that, failing a satisfactory agreement with the United States, the Indian mints should be closed forthwith to the free coinage of silver, and a gold standard be adopted. A draft scheme for carrying out this purpose, drawn up by the Indian finance minister, was submitted, and the proposal was referred by the secretary of state for consideration by a committee, over which Lord Herschell, the lord chancellor, presided. In their report, presented 31st May 1893, the committee discussed the plan of the Indian government, together with various alternative currency schemes which had been suggested. They were of opinion that the government expenditure admitted of no reduction adequate to the necessities of the situation, and that any resort to increased taxation would be fraught with difficulty and probable danger. The alternative schemes presented to them, such as an increased seigniorage on silver coinage, a duty on imported silver, or the coinage of a heavier rupee, were all open to objection; and not one could be recommended in preference to the government scheme. Accordingly, they felt unable to advise the secretary of state to overrule the proposals of the Indian government. But they advised that the closing of the mints against the free coinage of silver should be accompanied by an announcement that, though closed to the public, they would be used by the government for the coinage of rupees in exchange for gold at the rate of 16 pence the rupee; and that at the government treasuries gold would be received in satisfaction of public dues at the same ratio. These modifications, designed to guard against a sudden and considerable rise of exchange, were acquiesced in by the government of India. On the 29th June 1893, the Act No. VIII. of 1893 was passed to provide for the closing of the mints to the free coinage of silver from that day; and by official notifications of the same date provision was made for the issue of rupees in exchange for gold, and the receipt of British gold coins into the treasuries at the rate of 15 rupees to the £. Some time passed before there had been a sufficient period of freedom from disturbing causes, and it was possible to pronounce with any certainty as to the success of this experiment. Among such causes may be mentioned the attempt of government during the later months of 1893 to maintain a minimum rate for the sale of India council bills. The abandonment of that attempt at the beginning of 1894 was followed by a fall in the gold value of the rupee, aggravated for a while by the addition to the circulation of a considerable store of coins drawn from native hoards. The latter cause is considered to have exhausted its effects in the course of that year. The value of the rupee, after falling to a minimum of less than thirteenthpence, rose gradually, until at the beginning of November 1896 it exceeded fifteenpence, and it has not since fallen below that level. In time under the play of normal forces, the rupee exchange reached the stipulated point of sixteenpence. The possibility of assistance to Indian finance by raising the rate higher is obvious and should always be kept in mind.

Many of the native Indian states still cling jealously to their ancient right of coining, regarding it as a sign of sovereignty. Rupees of varying quality are issued from their mints. In 1876 the attempt was made to secure a common currency by providing that the government might coin rupees of the same weight and fineness as the government rupee, but with a different device, for any native state which would cease the operations of its own mint for thirty years. The act has had but little success, yet the native rupee is not nowadays a material factor in the circulation, owing to the limited numbers which are produced, and the restricted area within which they pass.

The silver coins subordinate to the rupees are of the value of one-half, one-quarter, and one-eighth of the rupee. They are of the same fineness as the rupee, and

of proportionate weight. The rupee and half-rupee are alone legal tender to an unlimited amount, the two lower denominations being legal tender only for the fractions of a rupee. The symbol "Rs." denotes ten rupees. Its use was more conspicuous in the days of the stable parity between gold and silver, when the rupee was approximately equivalent to two shillings, and Rs. to £. Large sums of rupees are expressed in lacs and crores, the lac being 100,000, and the crore 100 lacs.
